CONSTRUCTING FORCING PIT (West Coast).—Your house will be a span-roof resting on walls, which may be of stone, and reduced to 4 inches at top, so as to take a wall plate of that width. You have no front lights, nor are any necessary. This will be a great saving. We should not have any lights, but have the roof fixed, rafters and sashbars exclusively; the wall plates 4 inches wide and 3 inches thick; the rafters 4 inches by 2½, and fixed narrow surface upwards; sashbars, 2½ inches by 1½, and these narrow surface upwards. You will need a ridge piece 9 inches by 2 inches, and the rafters morticed and tenoned into it, and so that their upper surface will be 3 inches below the top of the ridge. Two feet from the ridge on one side you will need to introduce a cross piece 3 inches by 2½ inches, and level with the upper surface of the rafters, and parallel with the ridge. Into these cross pieces the sashbars are to be let, whilst on the other side of the roof they will be fixed into the ridge, they as well as the rafters on that side being fixed so as to correspond with those on the other. The rafters and sashbars we should fix so as to take glass about 15 inches wide, less rather than more. They may rest on the wall plates, being cut so as to fit on the wall plates exactly, and be raised so that the rebate for the glass may be 1 inch above them at the lower edge to admit a fillet of wood 1 inch thick and 3 inches wide, which should be cut so as to suit the rafters and sashbars, and project out beyond the wall plates 1½ inch, and having a groove on the under side half an inch from the edge. This will cause the water to drip into the spout and keep it from running down the walls. You will have a space at top on one side of the ridge clear, all but the rafters, 2 feet wide; for this you will need lights that may be 6 feet long, with sashbars corresponding with the rafters and sashbars, the lights 2 inches thick, and hinged with 4-inch butts to the ridge. These lights should move upwards with crank and lever, so that the whole can be raised at one lift, and opened little or much at will. You will need tie-rods of iron to every rafter, and about 4 feet from the ridge, calculating perpendicularly. They may be three-quarter-inch iron, and secured to the rafters with screw bolts. These rods will form an admirable spot for shelves, affording room for plants over the path. The rafters and sashbars to be rebated half an inch wide and deep for the glass, and two sashbars to be fixed between every rafter. The ends may be sashed for glass level with the angle of the roof, and be of the same strength as the roof sashbars. The door posts 5 inches by 4 inches, and door 2 inches thick and 3 feet wide, but it must not exceed the width of the path. The glass throughout 21-oz. sheet, thirds quality. The furnace may be 2 feet 3 inches long, 15 inches wide, and the same deep, with an arched roof of fire bricks, the furnace being composed of them. The ashpit should be 15 inches deep below the bars. The flue, for at least a yard from the furnace, should be of fire bricks, and you will need to have the bottom of the flue level with the top of the furnace. The flue may then be taken level, or with a very slight incline, to the chimney. The flue may be 15 inches deep and a foot wide. We should have the flue raised more than 4 inches from the floor, and the furnace sunk accordingly. The house would be best with the eads north and south. You may have Vines, one to each rafter, having a border partly within and partly outside the house, one side of the house being arched, so as to admit of the roots passing from the inside border to the outside ones. The flue will need to be on one side of the path, so as to admit of the inside border. Your house will be a vinery. Under the Vines you may have plants on a stage, but, these, though doing fairly, will not be so good as if you had no Vines; and in winter you will not be able to do more than exclude frost, as the Vines will then need rest.

HERBACEOUS PLANTS FOR FLOWER-CUTTING (F. J.).—*Campanula celtidifolia*, *C. macrantha*, *C. rapunculoides*, *Cheiranthus longifolius*, *Delphinium Beatonii*, *D. Belladonna*, *D. Madame Richelet*, *Dianthus neglectus*, *Erigeron speciosus*, *Hemerocallis flava*, *Nepeta Mussinii*, *Pentstemon Torreyi*, *Phlox subulata oculata*, *Scabiosa silenifolia*, *Sisyrinchium odoratissimum*, *Spiraea japonica*, *S. palmata*, *S. Filipendula plena*, *Statice latifolia*, *Trollius europæus*, *Veronica prostrata*, *Vicia argentea*, and *Saxifraga longiflora vera*. We have omitted Pinks, Carnations, Picotees, Wallflowers, Stocks, Liliums, Gladioli, Phlox, Paeony, Violets, &c., which are indispensable where cut flowers are in demand.

PRIMULAS OF LAST YEAR (Idem).—Being in 5-inch pots they should be shifted into 6-inch pots, the sides of the ball loosened, and then placed in a cold frame, removing to the greenhouse in October. Any old leaves should be removed, and the plants placed somewhat deeper than they were before, but do not cover any part of the fleshy stem, taking care not to wound the stem, otherwise the plants may die off at the neck.

MUSCH MUSCH APRICOT (J. R.).—Small, almost round, and slightly compressed. Skin deep yellow; orange red next the sun. Flesh yellow, remarkably transparent, tender, melting, and the sweetest of all Apricots. Stones Empervious. Kernel sweet. Excellent for preserving. Ripe in the end of July. This description is from Hogg's "Fruit Manual."

GRUBS ON PEAR LEAVES (A. Fisher; J. B. C. Cheshunt).—They are known popularly as the Slimy Grub, and are the offspring of a four-winged fly, *Tenthredo adumbrata*. If you can refer to our No. 638, page 484, you will see a drawing of the grub and the fly. To destroy the grubs dust the leaves with slaked quicklime. Two dustings generally destroy all.

INSECT ON CONIFER CONES (Beta).—It is a species of *Psylla*, probably *Psylla Laricis*. These insects are allied to aphides, and the same applications which kill the one would destroy the other.

NAMES OF FRUITS (Boston Spa).—Windsor Pear. (*K. C. B.*)—No. 1, Lewis's Incomparable; 2, Carel's Seedling. The Pear is not known. (*M.*)—Duchess of Oldenburgh. (*G. Diss.*)—No. 7, Laub Abbey Pearmain.

NAMES OF PLANTS (M. H. M.).—Perhaps an *Æschynanthus*, but the specimen was withered. (*H. T. M.*)—You send no leaf of your Aloe; it is near *A. miltreiformis* or *A. latifolia*. Ferns shortly. (*W. H. D.*)—1, *Spiraea salicifolia*; 2, *Gentiana asclepiadea*; 3, *Verbascum phœniceum*; 4, *Lysimachia vulgaris*; 5, a double-flowered variety of *Barbarea vulgaris*. (*Lady Maria.*)—*Auredera scandens*. (*J. Wisten.*)—You have named them all correctly.

POULTRY, BEE, AND PIGEON CHRONICLE.

THE POULTRY-KEEPER.—No. 17.

THE BREDA FOWL.

HEN—CUCKOO VARIETY.

The weight and form of a good hen of this variety, called also the Gueldre, are nearly the same as those of the Houdan. She should weigh 6 lbs. 10 ozs. Her head is almost exactly like the cock's in regard to comb, tuft, &c., and only differing in the

Fig. 69.—Breda Hen.

wattles, which are rather small. The foot is feathered like that of the cock, but the lengthening of the feathers of the hock is less apparent (fig. 69).

Plumage.—In each variety the plumage of the cock and hen is alike. In the Black they are all black, in the White all white, and in the Cuckoo variety it is entirely cuckoo. Each feather has four grey regular marks visible on the white ground (fig. 70), excepting the sickle feathers of the cock, the marks on which take the form of grains of oats.

Fig. 70.—Breda Hen's Feather.

With the hen the large feathers of the wings and tail are often less clear than on the other parts, and the marks of these feathers vary from six to seven.

The Breda and Gueldre are excellent layers. Their eggs are very large and excellent. They are seldom broody.

This beautiful fowl is much esteemed in Holland, where it comes from. In France the Black variety is believed to be much used in producing the Black Cochins, and it is thought that the Cuckoo (Gueldre) is used much in the production of the Cuckoo Cochins. It is certain that this variety is justly praised for cross-breeding, and traces of it are found in the principal French varieties.

BINGLEY POULTRY SHOW.

The eighth annual Show of the Airedale Society was held in Myrtle Park, Bingley, on August 26th. Poultry and Pigeons were shown under a tent in pens on Turner's principle. This is a good Show for young poultry, as may be expected from the

locality. In Red Game cockerels there were some good birds, especially that which was awarded the cup, the pullets also being good. In the next class for cockerels a Duckwing was first, and Pile second; but the best Pile in the class was left out, Duckwings winning all the prizes in the following class. *Cochin* cockerels and pullets were very good, the birds forward and well shown; the cup for this section going to Mr. Ansdell's grand pair of Dark Brahmas. The winners in *Spanish* were good forward birds. The *Dorkings*, to which the cup was given, were large, but the cockerel's legs were not good. *Polands* were good and forward; the first and second Gold, and third Silver. The *Hamburghs* were a grand display, the cup for the best pen going to a sweet pair of Silver-spangles. In Blacks Mr. Sedgwick was first with a well-known pair of birds, the rest being a fair lot. In the Selling class Dark Brahmas were first, and Spanish second. In *Bantams*, Game, Mr. Entwistle's grand Brown Red cockerel's time had evidently come, as he won the cup in a very severe competition; second a good Pile. Gold Sebright won first in the Variety class for Bantams, and Blacks second.

PIGEONS.—The entries for these were not so large as usual, but the quality was good throughout. Of *Carriers* there were but eight entries for both classes, and in *Pouters* only ten in the two classes, the cup going to a grand Blue hen against some very good cocks. In *Almonds* Mr. Yardley was beaten, but we thought that gentleman had not sent his crack pair. In the class for *Short-faces* the winners were both Mottles. In *English Owls* the winners were both Blue, but we thought the first rather thin in face. In *Jacobins* a good Red was awarded the cup, the second also a good Red, and in the following class some splendid Whites won the prizes. There were not sufficient pens, and some birds had to be judged in pens where other birds were. The awards were not completed till within twenty minutes of the close of the Show, and we found it impossible to get further particulars after the crowd was admitted into the tent.

GAME.—Black or Brown Red.—Cockerel—1 and Cup, T. Dyson, Halifax. 2, E. Lund. 3, J. Hind, Ferncliffe, Bingley. *he*, J. F. Walton, Horncliffe, Rawtenstall; W. Tiltotson. *Pullet*—1, B. Butler, Bradford. 2, J. Mason, St. John's, Worcester. 3, J. F. Walton. *he*, J. Hind; E. Winwood.

GAME.—Any other variety.—Cockerel—1, W. Clough, Earby, Skipton. 2, E. Winwood. 3, J. Mason. *c*, J. F. Walton; M. Jowett; J. W. Thornton, Bradford. *E. Ayckroyd*, Ecclesfield, Leeds; J. Fortune; J. Fell, Adwalton. *Pullet*—1, E. Ayckroyd. 2 and 3, Wilson & Hodgson. *he*, E. Winwood.

GAME.—Duck.—Cockerel—1, W. A. Taylor, Manchester. 2, H. Beldon. 3, C. Sidgwick, Keighley. *he*, C. Sidgwick; W. A. Taylor. *Any other colour.—Chickens*—1 and 2, C. Sidgwick. 3, W. A. Taylor. *he*, J. I. Booth, Silsden; T. H. Stretch, Ormskirk; W. A. Taylor. *c*, H. Beldon; Thornton & Bailey, Bingley.

GAME.—Dark.—Chickens—Cup and 1, T. F. Ansdell. 2 and 3, J. H. Pickles, Birkdale, Southport. *he*, W. Schofield, Birkenshaw, Leeds. *c*, W. H. Keighley, H. Beldon; M. Jowett, Clayton. *Light.—Chickens*—1, J. Long, Bromley Common. 2, J. Watts. 3, G. F. Umpleby, Boroughbridge. *c*, H. Beldon.

SPANISH.—Chickens—1, H. Beldon. 2, H. Wilkinson, Earby, Skipton. 3, E. Winwood. *he*, J. Thresh, Bradford; J. Roberts, jun., Silsden.

DORKINGS.—Chickens—1 Cup and 3, T. Briden, Cononley, Leeds. 2, G. Fox, Wilmslow. *he*, W. Morfitt, Goole.

POLANDS.—Chickens—1 and 2, T. Dean, Keighley. 3, H. Beldon.

ROCKS.—Chickens—1, W. Dring, Faversham. 2, J. J. Malden. 3, G. W. Hibbert, Gilders, Manchester.

HAMBURGH.—Golden-spangled.—Chickens—1, T. E. Jones, Wolverhampton. 2, T. May, Wolverhampton. 3, G. & J. Duckworth, Church. *Silver-spangled.—Chickens*—1, Cup and 3, H. Beldon. 2, W. Fawcett, Baildon. *c*, E. Gill, Ferriby, Bingley; T. Fawcett, Baildon, Leeds.

HAMBURGH.—Gold-pencilled.—Chickens—1, H. Beldon. 2, T. Fawcett, 3, G. & J. Duckworth. *he*, W. Clayton, Keighley; W. Driver. *Silver-pencilled.—Chickens*—1, J. Smith, Gilders, Bingley. 2 and 3, H. Beldon. 3, H. Smith, Keighley. *he*, J. Webb, Kellbrook, Colne; J. Webster.

HAMBURGH.—Black.—Chickens—1, C. Sidgwick. 2, H. Robinson, Westgate, Baildon. 3, H. Beldon. *he*, C. Sidgwick; H. Beldon.

ANY OTHER VARIETY.—Chickens—1, W. Cockshott, Farncliffe, Bingley (Silkies). 2, J. Long.

BANTAMS.—Game.—Chickens—1, Cup and 3, W. F. Entwistle, Westfield Wyke, Bradford. 2, E. Walton, Horncliffe, Rawtenstall. *he*, W. F. Entwistle; C. Noble; A. C. Bradbury; Mrs. A. Sugden, Swinley, Uckfield. *Any other variety.—Chickens*—1, Leno, Marygate Street, Dunstable. 2, H. Beldon. 3, S. Milner, Keighley. *he*, T. Dyson; J. Watts; H. Beldon.

SELLING CLASS.—Cock—1, T. Robinson. 2, D. Sharp, Bingley. *he*, H. Beldon; W. Tiltotson. *c*, Carr, Wilsden, Bingley; T. Fawcett; J. Sharp. *Hens or Pullets*—1, W. H. Hodgson. 2, J. Thresh. 3, H. Beldon. *he*, H. Wilkinson; J. I. Booth; J. Berry; J. Foulde, Bingley; J. Watts; W. Thwaites, Harden (Buff Cochins).

PIGEONS.

CARRIERS.—Black—1, E. Horner, Harewood, Leeds. 2, H. Yardley, Birmingham. *he*, A. T. Umpleby. *Any other colour*—1 and 2, E. Horner. *he*, W. Notage.

POUTERS.—Red or Blue—1 and Cup, W. Harvey. 2, E. Horner. *he*, W. Harvey, Shelfield; E. Horner; J. E. Crofts, Blythe, Worksop. *Any other colour*—1, H. Simpson, Spalding. 2, W. Notage. *he*, H. Simpson; J. E. Crofts.

TUMBLERS.—Short-faced.—Almond—1, W. Brydone, Langton Mains, Dunse. 2, H. Yardley. *he*, E. Horner; W. Harvey. *Any other variety*—1, E. Horner. 2, J. Lister. *he*, W. Harvey (2); E. Horner.

TUMBLERS.—Long-faced—Cup, 1 and 2, D. Riddiough, jun. *he*, W. Harvey. *he*, D. Riddiough, jun.; J. Watts; E. Horner.

BARNS.—Cup and 1, W. Harvey. 2, E. Horner.

OWLS.—English—1, Ward & Rhodes, Otley. 2, W. Binns. *he*, E. Lee. *he*, A. T. Umpleby; E. Rhodes; W. Hardcastle, Priest Thorpe, Bingley; W. Binns, Pudsey (2).

JACOBIANS.—Red or Yellow—Cup and 1, T. Croft, Killinghall. 2, W. Notage. *he*, T. Holt, Bradford (2); J. Smith, Walkley, Shelfield; A. A. Vander Meersch, Tooting; E. Horner; T. Holt. *Any other colour*—1 and 2, A. A. Vander Meersch. *he*, W. Croft.

PANTAILS—1, H. Simpson. 2, J. F. Loversidge. *he*, G. F. Umpleby; J. Walker, Newark; E. Horner. *c*, W. H. Tomlinson.

TURKITS—1 and 2, W. Croft. 3, W. Moore. *he*, T. Foster, Bingley (2). *he*, H. Beldon; C. Newall, Keighley; E. Rhodes, Great Horton; W. Croft.

ANTWERPS.—Short-faced—Cock—1, J. Wright. 2, J. Lister, Keighley. *he*, E. Horner. *he*, J. P. Rothwell, Rochdale; W. Gamon, Chester; J. Wright,

Manchester; Tordeff & Wilkinson, Wibsey, Bradford. *c*, H. Yardley; W. Ellis; J. Crossland. *Hens*—1, W. Ellis. 2, J. Wright. *he*, W. Gamon; J. Lister (2).

ANTWERPS.—Long-faced—Cock—1 and Cup, J. Lister. 2 and *he*, W. Ellis. *he*, J. Wright; H. Jennings. *Hens*—1, H. Jennings. 2, J. Lister. *he*, W. Ellis.

DRAGOONS.—Blue or Silver—1, Ward & Rhodes. 2, W. Binns. *he*, T. Smith, Lawkholme, Keighley. *he*, S. Cliff, Nantwich; W. Gamon; J. Lancaster, Northgate, Baildon; W. Harvey. *c*, A. Smith, Northwam, Halifax; A. Bentley. *Any other colour*—1, R. Woods, Mansfield. 2, W. Binns. *he*, F. Graham, Birkenhead.

ANY OTHER VARIETY—1, W. Harvey. 2, H. Beldon. *he*, A. A. Vander Meersch (2). *he*, J. Watts; E. Horner. *c*, J. E. Crofts.

SELLING CLASS.—Single Birds—1, W. Brydone. 2, H. Beldon. *he*, W. Barker; J. Lister. *c*, S. Rushton; E. Horner; J. Hawley, Gillingham, Bradford. *Pairs*—1, H. Beldon. 2, A. A. Vander Meersch. *he*, W. Brydone; D. Riddiough, jun.; T. Foster; E. Laycock, Atterworth, Keighley (Archangels); W. Jackson (Speckled Dragons); Tordeff & Wilkinson; K. White; E. Horner; J. Hawley; J. E. Crofts.

JUDGES.—Poultry: Mr. J. Dixon, North Park, Clayton, Bradford. **Pigeons**: Mr. W. Cannan, Bradford.

GREEN HAMMERTON POULTRY SHOW.

The twenty-eighth Exhibition of this Society was held, in connection with a horticultural show, on August 25th. The pens numbered 135, there being a slight increase of entries in both poultry and Pigeons. Some of the classes were well represented, more especially Dorkings, Game, Brahmas, and Game Bantams, and there were a few good birds in most of the classes. A capital pen of Brown Red Game chickens secured the extra prize for the best pen in the Show. There were some good Pigeons in all the classes.

SPANISH—1 and 2, R. R. Farrer, Green Hammerton Hall.

DORKINGS—1, J. Robshaw, Whitley. 2, Miss Haggard, Wilstrop Hall. *Chickens*—1, R. R. Farrer. 2, T. P. Carver, Langthorpe.

BRAUMA POOTRA—1, E. Williams, Sharow. 2, Miss C. Dent, Ribston Hall. *he*, T. P. Carver. *c*, E. Williams; G. Umpleby, Boroughbridge; C. Holdsworth, Harrogate. *Chickens*—1, T. P. Carver. 2, Miss Lord, Starbeck. *c*, T. Horseman; G. Umpleby.

GAME—1 and 2, J. Watson, Knaresborough. *he*, C. Williams, Knaresborough. *c*, Wakefield, Whitley. *Chickens*—1 and Extra, J. Watson. 2, J. Robshaw. *Cochin-China*—1, G. Holmes, Driffield. 2, K. Raworth, Harrogate. *c*, R. Raworth; Wells & Sherwin, Ripon. *Chickens*—1, W. Lanton. 2, Wells and Sherwin.

HAMBURGH.—Golden-spangled—1, T. P. Carver. 2, G. Holmes. *Golden-pencilled*—1, Wells & Sherwin. 2, J. Robshaw. *Chickens*—1, J. Robshaw. 2, Wells & Sherwin.

HAMBURGH.—Silver-spangled—1, G. Holmes. 2, J. Robshaw. *Chickens*—1, J. Robshaw. *Silver-pencilled*—1, Myers, Ripley. 2, J. Robshaw. *Chickens*—1, J. Williams, Knaresborough. 2, E. Myers.

GAME BANTAMS—1, Wells & Sherwin. 2, T. P. Carver. *c*, C. Holdsworth. **BARNDORF**—1, J. Cocker, Nun Monkton. 2, Chapman, Green Hammerton. *Chickens*—1, T. P. Carver. 2, G. Sadler, Boroughbridge. *c*, J. Cocker; H. Flint, Nun Monkton.

GESE—1, G. Theakstone, Nun Monkton. *Goosings*—1, G. Theakstone. 2, Mrs. Dickson, Little Ouseburn.

HAMBURGH.—Duckling—1, T. P. Carver. *Ducklings*—1, G. Sadler. 2, T. P. Carver. *Rouen*—1, Graham, Aldborough. 2, Sadler. *Ducklings*—1, Graham. 2, Miss Haggard, Wilstrop Hall. *Any Cross Breed*—2, J. Chapman, Great Ouseburn.

TURKEYS—1, Miss Haggard. *Poult*—1, Miss Haggard. **SELLING CLASS**—1 and 2, T. P. Carver. 3, Wells & Sherwin. *c*, T. Horseman; C. Holdsworth.

EXTRA STOCK—1, G. Sadler. 2, T. P. Carver. 3, Miss Lord.

PIGEONS.—Tumblers—1, Wells & Sherwin. 2, Sadler. *c*, Chapman. *Pantails*—1, Wells & Sherwin. *Croppers*—1 and 2, Wells & Sherwin. *c*, R. R. Farrer. *Any Distinct Breed*—1, G. Umpleby. 2, A. Blackborough, Harrogate. *he*, Wells & Sherwin; G. Sadler. *c*, Wells & Sherwin; Chapman. *Selling Class*—1, G. Sadler. 2, K. R. Farrer.

JUDGE—Mr. Joseph Walker, Birstwith, near Ripley.

COTTINGHAM POULTRY SHOW.

The annual poultry, Pigeon, and Rabbit Show and Floral Fête of this most beautiful village was held in the grounds of Mrs. Gee, kindly lent for the purpose. It would be difficult to find a more picturesque and excellent site, for the large and amply-furnished horse chestnut trees afford a welcome shade from the hot sun, and add to the beauty of the scene. No tent was provided for the poultry section, although most spacious ones were erected for the floral department, and we would direct the attention of the Committee to this want, and also to the need of dispensing with the ugly wicker skeps in which the poultry were penned. They are most awkward for the birds, make these difficult to see, and are altogether unsightly. They would no doubt sell for various purposes, and save the cost of rental for the time between one show and another. The Committee deserve the highest commendation for the manner in which they attended to the birds placed in their hands.

Spanish were first on the list; the first-prize pair very grand in all points, the second also good. *Cochins* were very good, but *Dorkings* poor. In *Game* a fair pair of Brown Reds were first, but the rest were of little merit, the only bird in single cocks at all worthy of notice being a really good Brown Red. The Variety class contained a very good pair of Duckwings; the second-prize cock was good, but broken in feather. If we except the winners in *Hamburghs* there was not one pen worthy of notice, but the winners were mostly well-known birds. *Brahmas* were bad, but *Bantams* pretty good throughout, the winners in *Game* being Black Red chickens of great promise, a capital cockerel also winning in single cocks. In the Variety class of Bantams was a grand pen of Silver Sebrights, which we unhesitatingly

pronounce the most perfect we have yet seen of the pure snow-white ground. In *Ducks* Rouens were first and third, Aylesbury second, and these were pretty good; and in the Variety class Black and White Calls divided the prizes.

PIGEONS were the best section, whether as regards the quality or numbers. They were shown in Turner's pens, and as a display, made quite a contrast to the poultry and Rabbits. *Pouters* were first on the list, a grand showy Blue cock taking the first prize and cup, closely pressed by a nice slim-built White cock, which, however, did not show well. A nice Black was third, and several others were mentioned. *Carriers* were not good, though the first-prize Black was tolerably good. *Turbits* were capital, almost every bird being of high character; the first a Blue cock, second Yellow, and third Red. *Trumpeters* were fine; better, in fact, than often seen. Mr. Meersch won all the prizes with imported birds. Those in pen 11, v.h.c., were of the old English variety, and very good for that kind. *Jacobins* were capital in head, hood, and chain, and all the winners Reds. *Fantails* were a fair class, the winners large-tailed, good also in carriage; second also a well-spread tail, and third rather large, but good in all other respects; while pen 5, n.c., was small and splendid in style, but had no tail, No. 7 being very open in the top part; both the latter needed rest and new feathers. *Dragoons* were very fine; the first a Red cock, sound to the very roots of his feathers, and second and third Blues. In *Tumblers* an exquisite Almond was first, an Almond cock very fine in head second, and a capital Kite third. No. 9, also an Almond, was altogether out of order. *Nuns*, as may be expected, were very good. Of *Owls* there were but four entered, the first a Black foreign, second Blue English, and third Blue foreign, the latter having some white feathers in its check. In *Barbs* we found some young but good specimens; the first a Dun, second and third Blacks. In Any variety the first award was made to a good Red Jacobin, second a Pigmy Pouter, and third a Black Maggie.

RABBITS.—There were three classes. The first, for Lop bucks, had six entries, and some of these were very good. The first, a Tortoiseshell, was young and not large, but in fine order, 2½ inches in ear by ½; second large, but out of condition, 2½ inches by ½, good in all other points; the third, Fawn-and-white, had a bad eye, and was 20½ inches by ½. Of does there were seven entries, and these were a grand lot. The first, a Fawn doe, was large, in the finest order, with large dewlap, and ears 2½ inches by ½; second also Fawn, was 20½ inches by ½; the third a Tortoiseshell, 2½ inches by ½. In the next class a nice even Silver-Grey buck was first, a good Angora second, and a very large Patagonian third.

There was a section for **CANARIES**, in which we found some excellent birds of the Derby tint, but these were left out, as a rule, for birds of a most mongrel colour—birds, in fact, that were not Norwich. In the Buff class, however, this rule was reversed, and the prizes given to a variegated and even-marked specimen; and in this class one of the most exquisite Mealy specimens was left out without even a commendation, which we consider wrong in a mixed class.

The day proved fine, and an immense number of fashionable visitors from the adjacent watering-places attended the Show.

SPANISH.—1, E. Brown, Driffield. 2, Pickering & Duggleby, Driffield. 3, M. Bingham, Cottingham.

these ought by all means to have been reversed. *Owls* were not good; a moderate pair of Blue English were first, and Foreign Blue second. *Barbs* were Blacks in both cases, the first older and better made-up than the second; the latter a promising pair. The *Jacobin* class was the worst judged of all the Pigeons, the best pair being left out altogether; these were Reds of most exquisite colour. In Pen 732 the first were bad in colour, and grizzily in hood and chain (Reds). Second, Yellows, one bird good, but the other had yellow eyes. Pen 733 was commended, and one bird had a black eye. In *Tumblers* Black Mottles won both prizes; and in *Baldpates* both winners were Blue. In *Runts* the winners were both Silvers, but not the largest; a pair of Blues from Mr. Yardley were much the largest, but in wretched condition. *Fantails* were good as regards the winners, but the rest poor. *Dragoons* were, as usual here, a large class, but there were not many good pens, and we considered them well placed, though there were those of a contrary opinion. We were surprised to find only three pairs of Long-faced *Antwerps*, but these were very good birds, the first Red, second Blue Chequers. There were thirteen entries for Short-faces, but not one that could fairly be designated by that title, all being more of the medium-faced breed; but the prizes were awarded and as rightly as could well be.

DORKINGS.—1, J. Walker, Rochdale. 2, J. Robinson, Garstang.

ANY OTHER VARIETY.—1, E. Horner. 2, T. & W. Oddie.

JUDGES.—Mr. James Dixon, Bradford; Mr. James Heywood, Middleton, Manchester.

PENISTONE POULTRY SHOW.

The twenty-first annual Show was held at Penistone on August 20th. The classes being more numerous, the entries in most of the divisions were much larger than at Woodsome, there being classes for both young and old birds.

In adult *Dorkings* Mr. Harvey showed a capital pen, the second being also good; and in *Spanish* Mr. Beldon took both first prizes, the birds in these classes being good. In *Cochins* Buff and Lemon of high merit won, the chickens being Buff and White respectively. Of adult *Brahmas* only the first prize cock was worthy of notice, but the chickens were a grand class, Dark birds winning. There were two classes for *Houdans*, and some pretty fair birds were shown. In *Hamburgs*, with one exception, the prizes fell to the lot of Mr. Beldon, although in these classes the competition was as a rule very good. There were six classes for *Game* fowls, which are generally good here. In

the class for adult Reds both prizetakers were of the Brown variety, but in chickens they were Black-breasted, and though young they showed points such as would gladden the eyes of a good Game judge. Some fair *Duckwings* were shown in both classes, the pullets being especially good in colour. *Bantams* were a large class, and two second prizes were awarded; this we did not consider an abuse of privilege, as all varieties and ages were shown together. First and second were Black Reds, and extra second Black Rose-combs. *Turkeys*, *Geese*, and *Ducks* were poor except the winners in Rouens.

RABBITS were in pairs—a system we must again condemn, and we hope this defect will be rectified at future shows. A grand pen of Lops was shown; second came Angoras, and an extra prize was given to a pair of Fawn-and-white Lops.

DORKINGS.—1, W. Harvey, Sheffield. 2, Burch & Boulter, Sh-field. *Chickens.*—1, Burch & Boulter.
SPANISH.—Black.—1, H. Beldon, Goitstock, Bingley. 2, E. Brown, Sheffield. *Chickens.*—1, H. Beldon. 2 and c, Burch & Boulter.

GAME.—*Black-breasted and other Reds.*—1, J. A. Brook, Holmfirth. 2, B. Burton. *hc, C. Travis, Thurgoland; H. Beldon.* *Chickens.*—1, B. Burton. 2 and c, Miss E. Johnson, Wath-on-Dearne, Rotherham.
GAME.—*Duckings and other Greys and Blues.*—1, B. Burton. 2, J. B. Hepworth, Hatfield. *hc, H. C. & W. J. Mason, Hirstall, Leeds.* *Chickens.*—1, Miss E. Johnson. 2, B. Travis. *hc, Miss E. Johnson; M. Stringer, Ecclesfield.*
GAME.—*Whites and Piles.*—1 and 2, H. C. & W. J. Mason. *Chickens.*—1, J. A. Crooke, Holmfirth. 2, C. Webb, Barnsley.
ANY OTHER VARIETY.—1, W. Harvey. 2, G. W. Hibbert. *hc, J. Lawton, Thurlstone; G. W. Hibbert.* *Chickens.*—2, Moore & Cartwright. *hc, G. W. Hibbert.*
BANTAMS.—1, T. Marsden, Wike, Bradford. Extra 1, L. Higgins, Blackburn. 2, Burch & Boulter.
POULTS.—1, F. Parkin, Hunshelf. 2, J. Pearson, Snowden Hill.
GOSLINGS.—1, C. Marsh, Sheeohouse. 2, G. Swinden, Hunshelf.
DUCKINGS.—*White Aylesbury.*—1 and 2, E. Taylor, Deepcar. *Any other colour.*—1 and 2, T. Hainsshaw, Earlsheaton.
SPECIAL PRIZES.—*Goslings.*—1, J. Nicholson, Eastfield, Thurgoland. *Ducklings.*—1, W. Hawley, Penstone.

RABBITS.—1, C. Wright, Holmfirth. Extra 1 and 2, W. Allison, Sheffield. *hc, T. Marier, jun., Newton Moor, Hyde.*

JUDGE.—Mr. W. Cannan, Adolphus Works, Bradford.

HALIFAX AND CALDER VALE POULTRY SHOW.

The first half of the day (August 29th), was not one of the most suitable for an agricultural show, heavy showers falling at intervals during the morning, but, on the contrary, the afternoon was most brilliant, and the influx of visitors very satisfactory. In the poultry and Pigeon sections the old and bad pens had been replaced by Turner's excellent wire ones, and the arrangements were excellent.

Spanish were first, and among the adult birds there was one grand pen, the second also containing a very good hen. Chickens were good, forward, and very fine in face and drop. Adult *Dorkings* are fast falling in feather, and much need their well-earned rest. Young were large, the first-prize pullet excellent. In *Cochins*, the first were a well-shown pen of Buffs, the second being good Whites; and in chickens we thought the first prize better placed than at Skipton, where the Buffs were first, and Partridge second. In this case the Partridge (which are an extraordinary pair), were first. Of *Brahmas* there were only two pens of old birds, the first really grand; but in chickens it was generally thought that the prizes had been badly awarded, the first-prize birds being small and thin, without style, and the pullet very bad on the breast; the second, being good all round and very large, ought to have been first. Pen 455, highly commended, was not so well developed, but contained a most exquisitely marked pullet, and ought to have been second; while the reward for the first-prize pen should have been a commendation, though it is only fair to state that another grand pen, shown by Mr. Schofield, was too late for competition. Black-breasted Red *Game* were very good in all points but feet, but there were some fair birds in chickens; still, if the loss of a claw be no fault, then the second ought to have been first, for the first-winners were poor. In adult Brown Reds the prizes seemed to have been awarded more to feather than quality, the second being grand but in deep moult, while the first, in full feather, were a wretched pair. Chickens were well placed, the winners being two such pens as we have not seen this season. Of *Duckwings* there was only one pen, but it was very good. The first in chickens were a very good pair of bright-coloured birds, but the rest very poor. In *Game* of any other variety there were two entries of adults, both Piles, and very good. In

chickens of this variety the first was a very bad pen, while the second, with a good pullet, had the best cock of any colour that has been seen this year. Adult *Polands* were, first Silver, and second Gold. There were six classes for *Hamburghs*, the colours being mixed, which we consider a mistake, for the entries would justify a redistribution of the classes. Mr. Beldon won all the prizes, as also the cup for the best pen in the Show, with a capital pen of Silver-spangled chickens. The Black *Hamburghs* were very good. In the Variety class, the first were *Crève-Cœurs*, and second White Malays; and in chickens first came Malays, and second *Hondans*.

In Game *Bantams* the first pen was of Brown Reds, the second of Black Reds. Pen 537, also of that colour, were a specially neat pair, and all were chickens. In Black *Bantams* the first were old, and the second young; and in the Variety class the first were Silver-faced chickens of pure colour, the second Golden.

Of *Aylesbury Ducks* there were only three pens, and the prizes awarded as at Skipton, as also in Rouens; but in the Variety class the prizes were rightly reversed. In *Geese* the first were grand Whites, second Grey, also good. In the Selling class the first were White Cochins, and second Spanish.

PIGEONS.—The prizes were well awarded throughout; in fact we did not see a single exception to this. *Pouter* cocks came first, and the first-prize Blue cock, which was quite up and in fine play, won the cup for the best pen in the Show; a fine, long, wasp-waisted bird, not being in high order, only received a high commendation, the second going to a Red. In hens the first was a superb Blue, a splendid White running very closely and winning second. In *Carrier* cocks the first was Dun, and second Black, a very grand Dun receiving a high commendation. In hens the winners were Black, the second very heavy but beaten in the fineness and quality of the first. In *Almond Tumblers* the first were an exquisitely spangled pair, very small and good in carriage. *Tumblers* of any other variety were, first Yellow Agates, grand in head; second Red Mottles; and highly commended a very pretty pair of Blue Balds. *Dragoons* were not a fine class, but the winners were pretty good, the first, however, a little too long and Carrier-like in face and beak, but good in skull; the second a good old pair. In *Trumpeters* Mr. Fulton showed two grand pairs, first Mottles, and second Blacks. *Owls* were, White Foreign first and second, the first an almost perfect pair; of the second the hen had a lame wing, but these were also good. In *Turbits* Mr. Fulton showed the best pair of Blacks we have yet seen, and these won first, good Silvers coming second, the whole being noticed. In *Jacobins* good Reds won in both cases. In *Fantails* there were but two pens, the first grand in carriage and motion; second large with good tail. *Maggies* were, first Red, and second Yellow. In *Antwerps* the first were good Red Chequers of the Long-faced variety, the second being what were doubtless shown as Short-faces and Duns. Mr. Gamon's grand Blue Chequers were highly commended. In the Variety class was one of the largest pairs of Silver Runts we have seen of late, the second very good Brunettes; Ice Pigeons, Swallows, &c., being also noticed; and in the Selling class were Mottle Tumblers and Black Carriers.

SPANISH.—1, H. Beldon, Goitstock, Bingley. 2, J. Leeming, Bronghton, Preston. *hc*, Fallister & Hawkins, Topcliffe, Thirsk; J. Thresh, Bradford. *Chickens*.—1, H. Wilkinson, Earby, Skipton. 2, H. Beldon. *hc*, W. Jagger, Fordmill, Horbury; Mrs. W. Jagger, Fordmill, Horbury.

DORKINGS.—1, J. Walker, Rochdale. 2, J. Robshaw, Whixley, York. *Chickens*.—1, T. Briden, Cononley. 2, S. Brierley, Ending, Rochdale. **COCHIN-CHINA.**—1, J. White, Wetherby, Netherpton. 2, H. Beldon. *Chickens*.—1, C. Sidgwick, Keighley. 2, H. Beldon.

JUDGES.—Mr. W. Cannan, Bradford; Mr. J. Dixon, North Park, Bradford.

THE UTTOXETER POULTRY SHOW.

FROM causes on which we cannot now enter, the annual poultry Shows at Uttoxeter have been discontinued for the last few years; but on August 25th, the sixth meeting of the kind that has taken place there was held under a most ample tent in the Market Place, the pens being very nicely arranged back to back down the centre, and no better plan could be desired as to the arrangements generally than that adopted. The poultry immediately on their arrival were most carefully fed and watered, and the same unbroken assiduity was manifested towards them during the whole time of the Show.

With very few exceptions this was purposely made a chicken show, and one equally successful has certainly not been held in any part of the country during the current year. The well-matured character of the generality of the chickens betokened how much and equally well-applied care must have been taken of them by their respective owners. Again, there were numbers of chickens competing that with another month or six weeks' growth will be very troublesome rivals to shake off in the highest competition. Fifteen pens of chickens (all present), were not a bad opening class, as Dark *Brahmas* stood first on the prize schedule. The two prizes were taken by Messrs. Horace Lingwood and Thomas Ansdell. Each pen was such as must be a treat to any fancier, Mr. Lingwood's cockerel being a perfect giant, excellent in feather throughout, and with the best hackle ever seen on a young bird. The pullet with which it was mated was one of those lovely pencilled, steel-coloured ones that forcibly bring to mind the days when Mr. R. Boyle, of Dublin, used constantly to exhibit such to the (at that time), discomfiture of all opponents. The Lingwood pullet is alike all round, from the very base of both mandibles down to the very feathering on the toes; the fact being, there is not any lack of intensity of colour or markings in any portion whatever of the whole plumage. Both prize cocks are admirably clear-winged fowls, and possess breasts that are black as the raven's. So generally good was the whole class, that not less than ten pens in it received favourable notice at the hands of the Judge. Ten pens only constituted the Light *Brahma* class; in this Mr. Haines and Mr. Lingwood were the winners, closely pressed, however, by at least a half dozen pens; the whole class being in admirable condition and of first-rate quality. Messrs. Sidgwick and Crabtree came to the front in a general *Cochin* class, open to all varieties, whether White, Buff, or Partridge. Mr. Sidgwick was first with Partridge-feathered; and Mr. Crabtree, with Mr. Tomlinson close on his heels, was second. Fifteen pens of *Houdans* proved a very good class, all fair pens, and most of them singularly so; and here Mr. Wood was successful in both instances, keeping the premiums in the immediate neighbourhood. The same gentleman took both the other prizes for *French* fowls with *Crève-Cœurs*. Some of the best *Dorkings* shown this year were at Uttoxeter. Mrs. Arkwright being the monopolist of both prizes, but winning against many excellent chickens of younger date, and therefore not nearly so matured.

In *Game* fowls the Duke of Sutherland was first with the best pen of Black Reds we have seen this year, though but only recently dubbed; the second being a pen of Brown Reds, showing much quality also, but wanting age for the show pen. Only three pens of *Spanish* were entered, all good, but not quite as smooth in the face as is desirable. *Hamburghs* were a admirable, the Duke of Sutherland exhibiting strongly, and mostly with success, but with specimens that will not be at their best for perchance two months hence. Among the other most notable pens we must allude most favourably to the Rev. A. G. Brooke's *Malays*. They were Black-breasted ones, in grand condition, and abounding in Malay characteristics. *Bantams* were not, with the exception of the winning pens, at all equal to the former classes; but in speaking of the *Duck* class, open to Rouen and Aylesburys only, it is almost impossible to imagine

better than the four principal pens proved themselves to be. Rousens of specially good feather took precedence, but not without uncomfortable pressure from three pens of Aylesburys of the best type; all three pens were so perfect as to all but insure a dead heat. A fine day gave great success to the whole proceedings.

CHICKENS.

BRAHMAS.—*Dark*.—1, Horace Lingwood. 2, T. F. Ansdell. *hc*, T. H. Waterman; T. F. Ansdell; H. Chawner. *c*, E. Pritchard; W. H. Crewe; Mrs. E. Wilkinson; R. B. Wood; J. Watts.

CREVE-CEURS, LA FLECHE, or BREDA.—1 and 2, R. B. Wood (Creve-Ceurs). *c*, W. Dring (Creve-Ceurs).

DORKINGS.—1 and 2, Mrs. Arkwright. *hc*, R. Cheeseman; M. Murray. *c*, Rev. — Bartram.

GAME.—1, Duke of Sutherland. 2, G. Bentley. *hc*, T. P. Lyon; C. Minors. *c*, E. Bell; J. Lane.

SPANISH.—1, G. H. Chilcott. 2, E. Winwood.

HAMBURGS.—*Gold or Silver-spangled*.—1, J. Long. 2, T. May. *hc*, J. Ward; Duke of Sutherland. *c*, J. Slater.

HAMBURGS.—*Gold or Silver-pencilled*.—1 and 2, Duke of Sutherland. *hc*, J. Long; W. Clayton.

ANY OTHER VARIETY.—1, Rev. A. G. Brooke (Malay). 2, Duke of Sutherland (Black Hamburg). *hc*, E. Kendrick, jun. (Black Cochins); L. Nash (Black Cochins); T. Boulton (Black Hamburg).

ADULTS.

ANY VARIETY.—1, W. Catlack, jun. (Creve-Ceurs). 2, J. Long (Silver Poland). 3, R. B. Wood (Creve-Ceurs). 4, J. Watts (Brahmas). *c*, E. Winwood.

BANTAMS.—*Game*.—1, J. Mayor. 2, A. Ashley. *hc*, — Baskerville (2); Duke of Sutherland; A. Smith.

BANTAMS.—*Any variety except Game*.—1, W. H. Robinson (Black). 2, A. Ashley (Sebright). *hc*, F. Holbrook (White-footed); R. H. Ashton (Black).

COTTAGERS' CLASS.—*Any variety*.—1, J. Lane (Black Red). 2, W. Cops (Golden spangled Hamburgs). 3, T. Gould (Cuckoo Dorkings).

DUCKS.—*Rouen or Aylesbury*.—1, Duke of Sutherland. 2, J. Hedges. *hc*, H. Chawner; W. H. Crewe.

Mr. Edward Hewitt, of Sparkbrook, Birmingham, was the Judge.

UNITING SWARMS.

ALL earnest writers on subjects of bee history and management, find that their own productions are defective and incomplete. Their ability is not equal to the work in hand. Some things are forgotten; some things are not thoroughly understood; and others well understood are not stated clearly enough for a great number of writers. I suppose all human efforts are marked by imperfection. The straightest line ever drawn by man is somewhat crooked under the scrutiny of the microscope.

Information was lately sought and given on driving and uniting bees. More inquiries on the same subjects are to hand. Every week we are receiving evidence of great and enlightened progress made in bee-keeping throughout the country. This morning a letter of thanks has been received from a bee-keeper at Tiverton, near Bath. He says, "In driving my bees according to your instruction I have succeeded better than I expected. From the hive I mentioned I have obtained nearly 40 lbs. of honey; there was but little brood in it. I have driven another hive with about the same results. These swarms are fed with a pound or more of syrup every day. The idea of driving bees is a novel one in this neighbourhood. Old bee-keepers say the bees will not survive the winter, but I am sanguine as to the result." The same post delivered another letter from a village in Banffshire, asking for a market for honey. The writer says he has "turned out some swarms and found their hives quite full of honey. Had I come across your instructions sooner more money would have been in my pocket. I can now apprehend what large hives and large swarms mean, I assure you. In the paths of apiculture you have many followers in this part of the country, and this year we have had extraordinary success."

In answer to the questions of "R. E. H.," we have to say that after a swarm has been driven into an empty hive, they are not driven in like manner "into another inhabited hive." They are cast or thrown in at one stroke. If done as described last week there will be no fighting. One of the queens will be killed and cast out. If one of the queens is too old for keeping, it is wise to kill her before the union takes place; thus the younger one will be preserved amongst the united bees. In cases where stocks cannot be brought together and united, "R. E. H." asks, "What is to be done to overcome the tendency of bees to return to their former stand, and there lose their lives?" Last week we said there was but little risk or danger if all the hives were removed at the time of union from their former position; but suppose all hives cannot be removed, how can the bees of a honey hive be preserved?

1 2 3 4 5 6
O O O O O O

Let us say that we wish to take the honey from No. 5, and put its bees into 1 and 3. Can this be done safely? No, the bees would go back to their old position, and probably be killed at the doors of 4 and 6. In such a case we drive the bees out of

No. 2, and unite them to 1 and 3; then the bees of No. 5 are driven and cast into No. 2, which takes the place of No. 5. Thus by a very simple process we get the hive of honey, and strengthen 1 and 3 with bees without the loss of life.

After all that can be said and taught, much must be left to the ingenuity of the bee-keeping community. The Scottish bee-keepers, as a whole, need but little stimulus and instruction now. A little more experience and practice will convince them that they are in the vanguard of the apian army. The little leaven that is now working among the rural population of England will by-and-by leaven the whole. Put large hives into the hands of the cottagers of England, and these will put a large revenue into their pockets. The £ s. d. gained go a long way to clear off the fogs and widen the landscape. Large hives and good management go nearly hand-in-hand, though they generally stand in the relation of parent to child. The question of finances in bee-keeping, as in farming and market-gardening, is the most up-lifting and successful.—A. PETTIGREW.

BEE PHENOMENON.

IN the beginning of July Mr. Boulton, a tradesman of Ulverston, North Lancashire, called my attention to a hive of bees, pure Ligurians, in which were two young queens working together, and requested me to send particulars to the leading bee journals. So far no parallel case has been published, and I now append you a further history of the hive.

The bees were a last-year's swarm, and were enclosed in one of Woodbury's bar hives. All went well until the spring, the swarm being a very strong one; later on, however, it was noticed that the swarm was not doing well, and it was believed that the queen was dead. This belief led to an examination about the middle of June, and a queen's cell was discovered, and a young queen was seen amongst the bees. There was no worker brood in the hive, but a little drone brood was noticed. On the 28th of June Mr. Boulton was in his garden with several bee-keepers, friends of his, when he opened the hive to see how the young queen was progressing. The first bar was full of brood on each side, and had on it a young queen; the next was empty, but the third also was full, and had likewise a young queen. They continued on their separate bars for about a week, and on the 3rd of July another examination showed them to be on the same bar, but on opposite sides. A week later and they were found on the same side of the bar, distant only an inch from each other, and in the midst of the bees, working together in apparent concord. More recent examinations have shown them in different positions in the hive, sometimes on one bar, sometimes on separate ones. The broods from each were of the same age and in the same state, showing that both had commenced laying at the same time. One queen was a small one, and the colour not so good; the other was large, and of a beautiful yellow. During August several examinations were made, but the smaller queen has not been seen; but as examination was very difficult, owing to the fulness of the hive, it was hoped that she might turn up. A thorough search was made on Monday week, but the result was a failure, and she has evidently been killed.

The theory of bee-keepers here is, that in consequence of the loss of the old queen the bees had proceeded to hatch two young ones, and seeing the weakness of the hive, had allowed both to live until the hive was replenished and strong enough to do with one, as it is now, for they are making honey fast. Mr. Boulton's friends wished him to divide the hive into two, but he firmly refused, being anxious to see the result.—BETA.

THE PLURALITY OF QUEENS IN A HIVE.

YOUR correspondent Mr. Boulton's having two fertilised queens working harmoniously together in one hive is so singularly exceptional that no satisfactory explanation can be given of it. If the witnesses were competent, who dares question their evidence? We were told that many apianians saw both queens at work in the hive at the same time. This phenomenon is of a remarkable character. I shall be glad to hear again of Mr. Boulton's hive, and whether both queens are still alive, for I have never found bees that would permit two queens to live in their hive; and, moreover, I have never known two fertilised queens live long together. My experience is pretty extensive, comprising the hatching of thousands of queens and unions of swarms. In every case one queen only has been kept in a hive, and one queen is, by reason of her fertility, as good as twenty.

An apianian in our neighbourhood has now two swarms in a large box, separated by perforated zinc. The experiment is made to find out whether both swarms will work harmoniously together in filling one super over both. Doubtless the swarms will become one, and work as one in filling the super. But will both queens be permitted to reign jointly or separately? When the experiment in question was first mooted, I predicted that one of the queens would be destroyed. About a fortnight ago I was told that one of the queens was found alive in front of the

hive, and was again put into one of the compartments of the box. By-and-by we may hear whether both queens are alive or not. In Mr. Boulton's hive there is no partition separating the queens and communities. In his hive the old queen died, or was lost. Two young ones were seen to leave their cells. All this is natural and usual; but why both were permitted to remain together is the marvel. Old queens in their dotage are invariably cast out of their hives before their successors are hatched. I have never known it otherwise, and in the swarming season I have never known young queens perfected at the time of the old ones leaving their hives with first swarms. If the weather be unfavourable for swarming, the young queens are torn out of their cells a few days before they are matured. If the weather become more propitious, eggs are again set in royal cells before the swarms leave. When the young queens come to perfection, the well known sounds of piping may be heard. Sometimes two queens go with the second swarms, and sometimes four or five more are left in the mother hives; but all are destroyed but one. This is the usual order of events, and I have all through life considered that the laws of a bee hive in this matter are as unalterable as the laws of the Medes and Persians. The queens in Mr. Boulton's hive are Ligurians.—A. PETTIGREW.

OUR LETTER BOX.

PIPPED BRAHMA COCK (J. D. E.).—The poultry-keeper is quite right; the horny substance at the tip of the tongue should be removed, and nothing does it so effectually as the thumb nail. All fowls do not require it, but where it is necessary it should be done promptly.

BREEDING DARK BRAHMAS (Amateur).—You may go on one year breeding from the two hens, and the best of the cocks you had from the three purchased birds. You must keep them strictly by themselves. We do not believe in strains any more than in men that measure 6 feet 3 inches. When you have examined the prize pen at Birmingham, and are determined to have some of the same blood, usually you will be astonished at the difference between the birds you saw and those you bought. The breeders of first-prize birds put the best specimens they can find wherever they see them. They breed a great many, and show their best, but it is "midsummer madness" to fancy they are anything like the average of the yard. The celebrated Lord Rivers was asked once the secret of his having so many good greyhounds, his answer was, "I breed well and hang well;" and so we advise you to hide your time, to keep the two hens and the two best pullets you have bred in a state of single blessedness until you meet with a cock to your mind at some of the great shows. A good horse is never a bad colour, and the cock possessing all the attributes you seek cannot be unfit for your purpose.

POUTERS' LEGS PARALYSED (Item).—There is no cure for paralysis in a Pigeon when it is thoroughly developed, but if the case be a curable one the treatment is repeated doses of castor oil. Each dose a teaspoonful.

BREEDING ROSS COCHINS (E. B.).—You can hardly expect much success if you breed from the old bird. You say he is small; his progeny will not be large, and size is an important thing in Cochins. If you object to buy, put the old bird with the pullets, and a cockerel with the hens. Hatch as early as you can, and feed well from the first.

CROOK SHOW.—Mr. W. J. Frank informs us that he took the first prize in the Brahma class.

ROCHDALE POULTRY SHOW.—Mr. J. H. Pickles informs us that he received the second prize in the Brahma cockerel class.

BOOK ON HOMING PIGEONS, &c. (A. K. C.).—The only work we know is "The Homing or Carrier Pigeon," published by Routledge, price 1s. We do not know where traps for letting the birds in and out of a loft can be procured. Perhaps some reader may be able to give the required information.

HIVE UPON HIVE (W. E. M.).—The bees in your top hive should be driven out and put into the nadir or hive under it. The great bulk of the honey will be found in the upper hive. If the nadir has not honey enough in it for winter let it be fed at once, and probably another hatch of brood will be obtained, making it strong in bees for another year. If the upper hive contains brood about one-fourth of the bees could be left to hatch it, but the queen should go into the bottom hive. We advise you to put all into the nadir, and take the honey now.

UNITING BEES (A Bee-keeper).—You inform us that by shaking a swarm on a cloth, and placing a hive of bees on two sticks over the bees, you failed to unite them; that one of the swarms killed the other. We have to inform you that you will probably fail a second time if you make an attempt in the same way. If you had shaken both swarms on the cloth, and let all creep together into one hive, you would likely have succeeded; but this is not our mode of uniting swarms. The hive to receive the swarm is first fed by sprinkling minted syrup amongst its combs and bees. In about twenty minutes after this is done the swarm of bees to be added to it is cast or thrown in amongst the rest, sprinkled over with the scented syrup, and placed on its board. Properly done, this is an infallible way of uniting swarms. We could undertake to unite one thousand swarms of bees in this fashion without once failing. In your attempt you did nothing to prevent the bees from knowing and killing strangers. It is always well to leave nothing to chance.

VARROES (B. E.).—Turn up your hives and examine their combs; you would learn more from one look than from our answers to your questions. You ask, "Do queens lay eggs and bees hatch brood all through the winter?" No. Queens cease to lay in autumn. An examination will let you know when the brood is all hatched. Brood combs do not hang separate from honeycombs, but the brood is usually in the centre of the hive, and is easily distinguished from the honeycomb, which is usually above and around the brood combs. The lids over brood cells are convex, those over honey cells concave, altogether different in appearance. In answer to your first question we have to say that usually there is no brood in a hive three weeks after it has swarmed, and during autumn and winter. Honey can be taken from a hive before its brood is all hatched.

SMALL BIRD (J. Thompson).—Your description agrees with that of the Redpole Linnet, *Fringilla Linaria*. Its song is clear and loud. There is a

very pleasing account of it and its habits in Magillivray's "British Birds," and in Brent's "Song Birds," which you can have by post from our office if you enclose twenty postage stamps with your full address.

DAMSON WINE (J. C.).—Put $\frac{3}{4}$ lbs. of sugar to every gallon of water, boil and skim it for two hours, and to each gallon add 5 lbs. of stoned damsons; boil these till the liquor is of a fine red colour, strain it through a sieve, and ferment it in an open vessel for four days. On pouring it off from the lees clean the vessel, and put in the liquor to finish the fermentation; close it well for six or eight months, and when fine bottle it off.

MINTED SYRUP (B. E.).—Minted syrup is sugar and water strongly scented with mint. Grated nutmeg is quite as efficacious as mint in the syrup.

BERKSHIRE PIGS (Dairy Farmer).—It requires a practised eye to distinguish which "at all points is the best." The Berkshire pig is usually of a tawny white or rufous-brown colour, spotted with black or brown; head well placed; large ears, generally standing forward, though sometimes hanging over the eyes; body thick, close, and well made; legs short, small in the bone; coat rough and curly, wearing the appearance of indicating both skin and flesh of a coarse quality. Such, however, is not the case, for they have a disposition to fatten quickly; nothing can be finer than the bacon, and the animals attain to a very great size, averaging from 50 to 60 stone, although they have not uncommonly reached to the prodigious weight of 100 stone and upwards.

REMARKS.

26th.—Occasionally hazy, but a fine day and splendid night.

27th.—Rather dull, but fair all day. evening and night rainy.

28th.—A very pleasant though rather cloudy day; wind high in the evening.

29th.—Rainy morning, a day of sunshine and showers, beautiful rainbow about 5 P.M., wind rather high.

30th.—Fine morning, sharp shower between noon and 1 P.M., fine afternoon, but rain again in the evening.

31st.—Fine morning, several showers and high wind, but some very bright sun.

Sept. 1st.—Fair early, but a very uncertain day, and very dark about 6 P.M.

A week of very unsettled weather, sometimes very bright and warm, at other times boisterous, wet, and cold. The mean temperature a trifle below that of the preceding week.—G. J. SYMONS.

COVENT GARDEN MARKET.—SEPTEMBER 2.

THE last few days of unfavourable weather for the gathering of fruit has somewhat limited the supply, and the demand has also slackened, trade generally not being so good. Out-door Peaches and Nectarines rather in excess. Hothouse Grapes and Pines ample.

From observations taken near London during forty-three years, the average day temperature of the week is 68.4°; and its night temperature 45.9°. The greatest heat was 88°, on the 13th, 1865; and the lowest cold 23°, on the 12th, 1867. The greatest fall of rain was 0.90 inch.

VEGETABLE CULTURE AND SUPPLY.

A CHAPTER ON WAYS AND MEANS.

VEGETABLES succulent, tender, abundant, and of the highest order of excellence, of every kind in its season, natural or artificial—that is to say, either from the open garden or by means of artificial heat, are so much and so generally appreciated, that a somewhat clearer knowledge of the ways and means that are more or less necessary for their culture appears desirable.

It may, I think, be very safely premised that vegetable culture generally is not at all what it ought to be, not so much regarding quality as quantity. It is the regular unfailing supply, leading steadily onwards throughout the year from crop to crop, from one kind to another in unceasing flow, that is required, and not a series of fitful crops upon which little reliance can be placed; for a good crop of any popular vegetable that is not promptly followed by others of the same or kindred sorts serves but to whet the appetite, and create wishes and expectations that are doomed to disappointment. That the efforts of many an earnest man are crippled and often rendered altogether futile by evils which it is totally out of his power to overcome is undoubtedly correct enough, and to such I offer my hearty sympathy; for I write in no carping spirit, but with a sincere desire to assist them. In trying to do this, general terms only can be used, for it is impossible to frame arbitrary rules that would apply in every case, each presenting its peculiar features which must be treated solely on its merits. We must adapt ourselves, and therefore our measures, to circumstances, and it is only by doing this thoroughly but cautiously that we may hope to conquer the difficulties that invariably arise.

Now there are three things that are indispensable for every garden—water, manure, and labour power; give me these and I will not care much about soil, situation, or any minor details; only let me have enough of these three grand powers, and I will undertake to maintain a full supply of high-class vegetables in spite of ungenial seasons. Be very sure this assertion is made in no boastful spirit, the writer has had too many battles to fight, too many difficulties to grapple with, to indulge in empty boasting; if it were not so these notes would not now be written.

No really good vegetables can be grown without abundance of moisture in the soil, and when it is asserted that certain summer crops—such as Celery, Spinach, Turnips, and Lettuce—have run to seed prematurely, and the weather is blamed, experience plainly tells one that it is not so much the weather as the culture that is at fault; either nutriment or water—perhaps both were wanting. Mark, now, I did not say the cultivator, but the culture; for when a man has diligently applied every means at his disposal, and then has to endure the bitter mortification of looking forward to inevitable failure simply because he cannot obtain the materials wherewith to finish what he began so well, he certainly merits pity, and not blame.

I said that I should be indifferent as to the nature of the soil, but it is obvious that one could only feel so with an ample staff of labourers; restrict this when the soil is bad and failure must follow. It is altogether useless for anyone to say that a given area of land only requires a stated number of men to cultivate it thoroughly. Nothing can be more unsound or more calculated to mislead than such a statement, and to prove this as clearly and forcibly as possible I cannot do better than describe a little of my own experience.

A few years ago I had charge of a garden which had been under tillage for several centuries. It was a small garden, and I do not suppose any great amount of science or skill had ever been brought to bear upon its culture; however, rough-and-ready as it was, the practice of successive generations of quaint old gardeners through all this long course of years, during which the land and people were undergoing a gradual change from a wild state to culture and civilisation, it was very evident that those of later date had kept the soil well stirred and renovated with abundance of manure, and so for once I found a deep yet light rich loam requiring nothing more than a very easy routine of seasonable manuring and digging to produce excellent vegetables. The garden which I now have presents as striking a contrast to this as could well be found. It is quite new, having only been under cultivation for about three years, and previous to the clearance of the site it was covered principally with a stunted undergrowth of Oak and Holly, interspersed with immense beds of Whortleberry. It is on the Wealden formation, and the soil contains a very large percentage of silica, distributed in such minute particles that a heavy shower or two will batter the surface into a hard close mass, which then looks as impenetrable as a paving stone. Taken in its virgin state it was almost barren, and the results of a series of trial crops showed that the seeds of most vegetables would barely vegetate in it, and what young plants came up soon dwindled away, even Jerusalem Artichokes and Horseradish failing to do more than put forth a few weakly shoots, the strongest roots dying the first season. To take such a soil in hand, in view of meeting the requirements of a large establishment, was to begin at the beginning with vengeance. Draining, trenching, frequent digging, with heavy and repeated dressings of manure and ashes are slowly but surely effecting a radical change. I use the term slowly advisedly, for although an ample supply of vegetables is now obtained, yet the soil requires a special preparation for each crop. Thus, for example, in such a simple matter as a bed of Cabbage, a plentiful dressing of manure is given; but in digging, the hard clods of crude soil are not to be broken with the digging forks, but have to be got to pieces afterwards with Canterbury hoes, then crushed with an iron roller, stirred a second time with hoes, and sometimes when the weather is very dry it has actually been found necessary to use water before the soil could be reduced to the requisite condition of fineness. Then for every row of plants a deep furrow is made, and filled with leaf mould, or a mixture of soil and

manure, such as a spent hotbed affords, and in this the Cabbages are planted. Lettuce and other salad plants are treated in a similar way. Peas and Beans are sown upon trenches filled with dung as for Celery, and similar trenches are prepared for Jerusalem Artichokes.

If it were necessary many other similar details might be added, but I think enough has been stated to illustrate the contrast with sufficient force and clearness, and to show how greatly one garden may differ from another, and therefore how it is possible for two gardens of equal size and presenting a very similar appearance to require a diametrically opposite mode of treatment, a greater or lesser number of men, more or less seeds and manure, and consequently a very different expenditure, to obtain equal results. The foregoing example of a poor soil is undoubtedly an extraordinary one, such as is very rarely to be met with; but there are many gardens where difficulties of a similar, though modified, nature exist, and which are only to be overcome by a proportionate allowance of each of my three grand powers. It is surprising to find new gardens being constantly made without any care or provision for a supply of water, and yet it is an acknowledged fact that in the majority of summers the success of many of our most important crops depends almost entirely upon its constant use.

Now this is what the culture of good vegetables amounts to: Get your land into good culture and keep it so. Follow a regular method of cropping, but let it be an elastic one—that is, not ruled so strictly by certain dates as by the peculiarities of the seasons. In providing seeds, always allow a margin for failure, just as in calculating the quantity of vegetables that will be required, you allow a certain surplus for visitors and dinner parties. Never allow vegetables to sustain any check, particularly from drought, but always strive to maintain a vigorous growth from the sprouting of the seed till the crop is fit for use; to which end there must be a soil that is well drained, sweetened by exposure to the air, especially in winter, containing plenty of rich manure, well watered, and with the surface frequently stirred and opened-up with hoes and forks. Let your tools be light, strong, and in good working order; and lastly, death to the weeds.—EDWARD LUCKHURST.

POINSETTIA PULCHERRIMA CULTURE.

DURING the winter a lack of bloom in the conservatory and other glass structures is too frequent, yet this might to a certain extent be obviated by a little more forethought on the part of the gardener. Again, where sufficient bloom exists, there is too often such a sameness of colour in the arrangement that a feeling of disappointment instead of pleasure is apt to take possession of the mind of the observer. To obviate this, I advise a few dozen Poinsettias being grown. No plant at that season excels it for table ornament, conservatory decoration, or for the manipulation of the bouquetist, to whom its brilliant crimson bracts are invaluable.

The plant may be grown in a greenhouse temperature, but to secure an abundance of vivid green foliage, and heads varying in diameter from 15 to 20 inches, I advise the following mode of culture to be adopted:—As soon as the plants have finished flowering they should be removed into a late vinery or other suitable place, and be gradually dried-off in order to cause their wood to ripen. This will have taken place by the end of March or beginning of April, when they must be cut-back to two or three eyes. The eyes on those shoots removed should be cut off and be inserted singly in the centres of thumb-pots, crocked and filled with a compost of peat, leaf mould, loam, and sharp sand in equal quantities. They should be plunged in a bottom heat of 70° Fahr., and in the course of a month or six weeks they will strike root. As soon as this has taken place they must be repotted into 1-inch pots in a mixture of peat, loam, and well-rotted sheep or deer dung in equal quantities. A few handfuls of powdered charcoal should also be added to the compost, and it will be found that crocking the pots with lumps of the same material will tend to promote a brilliantly green foliage. They should be placed in a pit or frame as near to the glass as possible, and on a firm bottom of cinder ashes; and a day temperature of 65° or 70° must be maintained. A little air should be admitted on favourable opportunities, but on no account must the plants be subjected to draughts, which in nine cases out of ten are the cause of their leaves turning yellow and falling off. They should also be slightly syringed overhead every evening, previous to leaving them for the night, with water from which the chill has been taken off.

By the end of August it will be found that the roots touch the sides of the pots, and the plants will then require another shift. This time they should be placed in 6-inch pots and in a similar compost, and they may be again set in their old quarters, the pit or frame.

From the first they must be kept well supplied with water at the root, and as I have previously mentioned, their foliage all through the growing period should be slightly syringed every evening with chilled water. As soon as they are established in the latter pots they should be watered solely with liquid manure made from sheep or deer dung, with the addition of a little soot. At the end of September they should be removed into a span-roofed house if possible, where a minimum day temperature of 70° is maintained. The Cucumber or Melon house might be made convenient for them. From this period they will not require syringing overhead, but a moist temperature should be secured them by keeping the evaporating pans filled with water, and by occasionally damping the floor and walls of the house. Eyes struck and treated in the above manner form excellent objects for table and other ornament; but they will not, of course, form such large specimens as the parent plants, to which I will now turn my attention.

The plants on being cut down should be watered but very sparingly until they have commenced to break. As soon as this has taken place the old soil should be carefully shaken from the roots, and they should be potted-back—that is, be placed in pots a size or two less than those in which they were formerly growing, and in a similar compost to that recommended above for striking the eyes. They may be placed along with the former, and as soon as the roots touch the sides of the pots they must be again repotted. This time a similar compost to that recommended for the eyes after they have struck root should be used, and if a few extra large specimens be desired at this period, two or more plants may be placed in a pot together. As soon as they have become established in these pots their tops should be nipped-off, which will cause them to throw out lateral shoots. The tops may be made use of as cuttings, and will form nice little plants by the end of the year. The plants should now be staked, care being taken to slightly bend the strongest and most robust shoots in order to divert the sap to those of less magnitude. Similar attention to watering, &c., to that recommended for young plants must also be paid them, and the result will be all that can reasonably be desired.—EDWARD FREEMAN, *The Gardens, Blundeston Lodge, Lowestoft.*

THE PELARGONIUM SOCIETY.

BELIEVING, as I do, that the ultimate success of the Pelargonium Society, so auspiciously inaugurated at South Kensington on the 2nd inst., will depend upon the support and encouragement it receives at its outset, I shall be excused for earnestly appealing for the immediate co-operation of all interested in its welfare. First, to my brother workers for the improvement of the Zonal Pelargonium, for whom it is hoped by the Society's promoters that it may constitute a bond of union between us, and be the medium of introduction to the goodly fellowship of kindred spirits, as well as the means of affording mutual assistance in carrying out our undertaking, and to whom perhaps the Society may be considered more especially to belong. I appeal also to horticulturists generally, be they amateurs or professional, Pelargonium growers or not, for aid and support; begging of all to bear in mind that horticulture, whether regarded and esteemed as a science, or its popularity desired commercially, its success and advancement will mainly depend upon the improvement of our fruits and flowers, and upon union amongst ourselves.

Having urged upon my friends the necessity for their aid, I will pass on to consider the best means of developing the Society, and forwarding the object it has in view.

The first step the Society deemed it expedient to take was to offer the highest amount of prizes its means (at present) admitted, as supplementary to those offered by the Royal Horticultural Society for Zonal Pelargoniums at their Show to be held in July, 1875; considering that by offering some liberal prizes in addition to theirs, a large and well-grown collection of all the best varieties would be secured.

If the prizes offered produce what the Society has a right to expect, the raisers of novelties would be enabled to compare notes, to profit by experience, and probably be stimulated to increased exertions; while the public would be afforded an

opportunity of forming a correct estimate of the value of Zonal Pelargoniums for conservatory decoration. The display on the last occasion, with the exception of the collections that competed for Mr. Pearson's prize, was most miserable in all the flowering sections, and there could not perhaps be a better argument in favour of this new Society.

Nothing would tend more, in my opinion, to render the Zonal Pelargonium popular than to show the public the wonderful progress that has been made within the last few years in this tribe of plants by an exhibition of well-grown specimens of the newest and best varieties. The flowers of the Zonal section have attained to such a state of perfection as to challenge the criticism of the florists, and the Nosegay varieties produce such gorgeous trusses, that they require only to be seen to be appreciated.

I quite agree with the remarks made by Dr. Masters at the meeting, that the Zonal section of the Pelargonium family is not the only one that might with advantage be improved, and to which encouragement should be afforded; for, with him, I believe that much could be done with the Cape species, amongst which there are the greatest variety and brilliancy of colour. Moreover, I see no reason why the size of the petals of the Cape species should not be increased.

I am of opinion that it is to these varieties of the Cape species that we shall have to look for our future bedders, for the large and perfect flowers of the florists' class of Zonals are not adapted for bedding purposes, and Mr. Pearson and Mr. Frank Miles, who is close upon Mr. Pearson's heels, are working such wonders in the Nosegay section, that it also is becoming too good for the purpose; in fact, it is a positive sacrilege to expose such lovely trusses of flowers as I saw in the house at Chiswick upon a variety named Mrs. Turner to the buffets of our ungenial climate. Compare also many of Mr. Pearson's other varieties that are in the beds, and flowering in the house too, and I think all will agree with me that they are magnificent for conservatory decoration, but that his industry has lifted them beyond their bedding era, and that the time has arrived for other species to be cultivated to supply their places.

When going over the beds at Chiswick a few days since, one of the most experienced of the Floral Committee remarked that he knew of no variety so effective as a bedder as Indian Yellow. I quote this remark as bearing out my opinion, that it is not the size of the truss, or of the individual flower, but rather the smallness of both, provided there is floriferousness, that makes the best bedders.

I strongly urged at our inauguration meeting against the title of our Society being restrictive, hoping that its funds might some day admit of offering encouragement for the improvement of all the sections and species of the Pelargonium family.

There are many matters connected with our subject that might be taken in hand by the Society with advantage. The classification of the Zonals, so-called, requires rectification; for under the present improved state of the Nosegay section it is almost impossible to decide upon a line of demarcation, causing frequent difficulty to the judges at exhibitions. The nomenclature of all the sections, too, is most unscientific, if not absurd; for instance, "Zonal," applied to plants without a zone. As for the term "Nosegay," it is positively ridiculous! The "large-flowering" varieties are now not much larger than our scarlets. "Fancies" suggest the question, Whose fancies? "French" to some varieties raised in England. Surely there is room for improvement here as much as in our flowers.

At our first meeting I broached a matter relative to the cultivation of the Zonals at Chiswick, which I consider one of much importance—viz., a proposition that all new varieties should for the first season be cultivated in pots under glass; so that, standing side by side, the new varieties could be readily compared one with another, and with all the best of the older varieties which would be under cultivation in the same house. These old varieties much require sorting and sifting this autumn, so that the inferior varieties might be thrown out and cancelled from the lists. By the adoption of this permanent exhibition, a much surer judgment could be formed of the value of new varieties, and the plants, moreover, would be in a better condition, instead of, as is too frequently the case, partially denuded of their petals by the shaking of a long journey. The following season they would, of course, be bedded-out, and thus an opinion could be given of their qualifications in both capacities.

These trials, too, would afford ample opportunities for all concerned in their circulation to make their notes, and amend their lists, and prepare themselves for purchasing and propagating prudently. I would suggest that our annual meetings should be held at Chiswick the day following the Pelargonium Show at South Kensington. We should be on the spot to discuss the novelties, and, from the experience of the previous day, in the best possible position to arrange the prizes and other matters for the following year.—JOHN DENNY, *Stoke Newington*.

THE MIDLAND COUNTIES HORTICULTURAL EXHIBITION: A RETROSPECT.

THERE is oftentimes a good deal of benefit to be derived from a retrospect. I propose to indulge in one, and to make an attempt to render it beneficial to all who are engaged in the conduct and management of horticultural exhibitions in general, by telling something about the events of the exhibition week at Birmingham in July last, and some of the lessons I learnt from them.

Mr. Quilter adventured on a bold experiment when he decided to set aside a sufficient sum of money to cover the expenses of an exhibition, such as that recently held at the Lower Grounds, where the prizes were £1200, and the other disbursements on an equally large scale. It was, however, a very proper experiment to make, though I am afraid, from what I have heard, Mr. Quilter's enterprise has not yielded him any pecuniary profit. Be that as it may, he has won golden opinions as to his pluck, energy, and perseverance, and time will, I trust, show that he has increased the number of his many friends among the leading exhibitors. In his anxiety to make arrangements for the comfort and convenience of horticulturists he somewhat overburdened himself, and undertook rather more than it was possible to perform with a staff rather lacking in organisation. However, of one thing we may be well assured—the lessons then learned will not be forgotten when the next show day comes round; and I feel sanguine that the Lower Grounds Exhibition will eventually be among the best managed anywhere.

One of the chief lessons which I learned at this Exhibition was, that for the successful conduct of an exhibition it is absolutely necessary that there should be a single central authority with power to settle all disputed points, and to do whatever in the exigencies of the moment may be found to be necessary.

Were I asked to settle what the organisation of an extensive horticultural exhibition should be, I should propound some such scheme as this:—

1. A general manager with absolute power.
2. A sufficient number of competent assistants.

The duties of the general manager would be similar to those of a general commanding an army. The duties of the assistants would be to carry out the orders of their chief.

The assistants would be more or less numerous in proportion to the extent and variety of the exhibition. They should consist (1) of an efficient clear-headed secretary, with a staff of well-trained clerks, whose duties on the show day would consist in distributing the show cards to the exhibitors, making out the prize cards, preparing the list of awards, &c. (2.) There should also be as many messengers as there are sets of judges, to wait upon them and carry their awards to the secretary, &c. (3.) A foreman for every tent, who would be captain of the men told-off to do the executive work in that tent. (4.) Men to do the necessary manual labour under the directions of the foreman. Each foreman should have a list of the entries for his tent, and be thoroughly familiar with them; and as the exhibitors come in he should as speedily as possible ascertain from them how far their exhibits will be in accordance with their entries. He should have previously marked-off in a legible manner the spaces assigned to the several exhibitors, so that without delay the exhibits may be placed in the positions reserved for them. Under no circumstances should the foreman leave the tent under his charge until everything is ship-shape. His assistants should be engaged only in such duties as he allots them, and not, as is usual, be sent hither and thither by a dozen masters.

The general manager, with such a staff of subordinates as I have described, limited to a definite work in a certain place, would find his arduous duties made comparatively light. Passing from tent to tent he would ascertain readily the state of affairs, and would perceive at once where supplementary

instructions or variations from his programme were needed. Being freed from executive duties, his mind would be at liberty to deal promptly and coolly with the multitudinous questions constantly arising on such occasions, and so delay, inconvenience, and vexation would be to a very large extent prevented, and hitches rendered almost impossible.

We will suppose the exhibits all staged ready for the judges, and the tents cleared of everyone but the foremen and their assistants. The judges will now enter on the scene of their labours, and the first thing they will do will be to confer with the foreman and ascertain from him what absentees there are, conforming their list of entries to the actual exhibits. Every judge will at once perceive the value of this step. They will then set about their work attended by their messenger, who, as the awards are made, will convey them to the secretary, bringing back to the foreman the prize cards, which he and no one else should affix in their proper places. Meanwhile, however, the foreman will have run his eye over the exhibits, and as there will certainly be plots of unoccupied space, his next work will be to decide how they are to be dealt with, for dealt with they must be before the public are admitted if an effective exhibition is to be produced. A competent man will soon decide what must be done. His attendants will now be busily occupied in carrying out his instructions. If the tent is sparsely occupied their labours will be heavy, for they will have to delude the eyes of the spectators so that they may not be aware of anything wanting. How this may be done will depend on so many circumstances that want of time and space prevents my entering in detail on the subject, but those who have had experience will readily understand all that might be said about it.

The general manager by this time will have gone the round of the tents; he will have detected all the weak places; he will have ascertained what changes in the arrangements must be made to meet the exigencies of the hour; he will have given his foremen their orders, and they with their assistants will rapidly carry them out, so that as the hour for opening arrives the feast will be duly set; everything will be in order; all the machinery by means of which the effect has been produced will be pushed away into the background, and a delighted assemblage of spectators will throng the tents, and warmly express their admiration of everything and everybody.

But it was not quite thus at Aston. There were two if not three managers, all of them competent men, and all sadly overworked in consequence of the absence of proper organisation, and a sufficient staff of assistants rigidly kept to do what might be required of them, and so a good deal of work was done, and had to be undone, and much that might have been done was left untouched. This, however, will not, in all probability, occur again, for Mr. Quilter was painfully aware of the defective arrangements, and will be sure to prevent a repetition. But it is not only at the Aston Show that confusion and overworked managers are to be met with, or I should not have offered the foregoing suggestions. So far as my experience goes they are to be found at most of our shows, and especially at our more extensive ones.

There was one very pleasant feature of the Aston Show which I should like to put prominently before the readers of the Journal, because it seems to me to be a step in the right direction, and one which may be wisely followed elsewhere, and especially at the provincial exhibitions of the Royal Horticultural Society. The judges' luncheon was provided as customary, but on the evening of the first day of the Show there was a dinner at which judges, managers, the press, &c., met together, and which was presided over by Mr. Quilter. The labours of a busy day were ended, the cool of the evening had arrived, it was but meet that after labour should come refreshment; and in a pleasant room some twenty persons, not a few of them leaders in the horticultural world, assembled together to enjoy a bounteous repast and indulge in pleasant talk. I have taken part in many pleasant gatherings, but the evening of July 7, 1874, stands out in my memory as one of the most pleasant of the number. The company was indeed a congenial one; they were everyone backbone horticulturists, professional or amateur. After the usual demonstrations of loyalty and success to the Midland Counties Horticultural Society had been drunk, there came other toasts which afforded apt speakers a rare chance for doing justice to pleasant themes. It is no intention of mine to mention names, but I cannot omit to record what pleasantries were indulged in by him who proposed the horticultural world in the fanciful toast of "Spades, Hoes, and Propagating Houses," nor the earnest and

touching manner in which he who spoke for his brethren responded; the horticultural press, too, was warmly proposed, and representatives of three of the journals spoke from the heart how much they felt the manner in which their labours were appreciated. A very pretty toast was proposed—"Pansies and Daisies," and associated with it was the name of him to whom the world is indebted for that pleasantest of horticultural pursuits, spring gardening. The speaker who proposed this toast told for the edification of the company how spring gardening commenced at Cliveden, and, extensively followed at the Lower Grounds and elsewhere, was influencing the little garden plots at back and front of little cottage homes and artisans' humble dwellings round Birmingham and the surrounding districts; how dreary mangy spots had been made bright and cheery with hardy spring flowers; and how working men were spending their leisure, not in the publichouse but in their tiny gardens. All honour, then, to him who had done so much for his fellows by means of Pansies and Daisies. Surely man was never prouder, or happier, or more overcome than he whom his friends applauded to the very echo. This is but a brief and meagre outline of a most enjoyable evening, the proceedings of which will live long in the memories of those who were fortunate enough to take part in it.

Surely such meetings as these bind man to man. Gardeners, men of literature, nurserymen, amateurs here met on common ground, thoughts and feelings were interchanged, pleasant memories were stored up, renewed strength was imparted to old friendships, new friendships were started into being, and everyone returned to his home all the better for the social intercourse which Mr. Quilter's hospitality had made possible and brought about.—PHILANTHES.

ROSE-GROWING AND ROSE-SHOWING.

I THINK it was a great pity Mr. A. Paul should have written so long a letter, when he might have summed it all up in one sentence—"Don't buy your Roses at Cheshunt, but buy them at our nursery." I have seldom read a more unfair or untrue production: unfair, because it is an attempt to disparage certain growers in the trade because they are exhibitors, and untrue because he ought to know that the Roses which fill the exhibition table are not from those plants which are offered for sale, but from maiden plants, which will not leave the nursery for another year. I have seen both the nurseries, and can tell the Rose-loving public that they are both equally good.

I presume Mr. A. Paul is a young man; if so, he had better tarry awhile ere he put pen to paper again; or, at any rate, strive to have a little more of the commodity commonly known as—JUSTICE.

[This is one of those discussions which are apt to lead to painful personalities, and we must beg that any further communications on the subject may be in our advertising columns.—EDS.]

NOVELTIES IN THE ROYAL GARDENS, KEW.

IN the house No. 1 *Clavija ornata* is in flower. The stem is unbranched, and for 3 feet below the leafy portion (where it is several years old), the racemes of orange-coloured flowers are freely produced. From this peculiar habit it draws attention from the most superficial observer. But for a slightly disagreeable smell the racemes would be valuable for bouquets, from their unique character and beauty. The genus is confined to South America. This species is native of Brazil and Guiana. It is sometimes cultivated in stoves, partly for the sake of its handsome *Theophrasta*-like foliage. It requires the usual stove treatment, and is grown from imported seeds.

In the collection of hardy aquatics, *Nymphaea tuberosa* is a rare Water Lily, with white flowers similar to those of *N. alba*, from which it is, however, distinct. Its chief character rests in the tubers of the rootstock, which are spontaneously detached, and often compound. It is a native of the northern United States, and consequently quite hardy.

Polygonum sachalinense, a comparatively new species, is producing its pale green flowers. It is of ornamental value for the "wild garden" and the backs of herbaceous borders on account of its habit and fine foliage. Native of the island of Sachalin and eastern Amoorland. *Clematis tubulosa*, native of North China, is in flower on the wall. It has bold dark green foliage; the flowers are blue, and so freely produced as to be effective, in form they are tubular, and therefore quite

distinct in appearance from the species usually cultivated. *C. Davidiana*, a new species allied to the above, is also in flower.

Gannera scabra is in fine condition. It has attained a diameter of 13 feet, with a height of 6 feet. The leaves in some cases are 4 feet in breadth, and have petioles of the same length. It has, perhaps, not been tried in this country as an esculent. "It is, however, said to be valuable to the inhabitants of Conception, where it grows luxuriantly. They not only prepare from it a cooling drink, which they consider beneficial in fevers, but the fruit has a certain repute for tanning leather, and the stems are used for tarts, for which purpose they are said to be little inferior to Rhubarb, and, above all, they are eaten raw after dinner with cheese and wine."—(*Gardeners' Chronicle*.) A patch of *Silene Schafta* is extremely pretty. It has a neat but loose habit, grows about 6 inches high, and is covered with rose-coloured flowers. It is a native of the Caucasus, and quite hardy.

Cotyledon spinosa is flowering on the rockwork. It is, perhaps, better known as *Umbilicus spinosus*, and has also been called *Sempervivum cuspidatum*, under which name it is sometimes cultivated. The flowers are pale yellow, produced in a dense erect raceme. Offsets are formed freely, and when very small may be pricked-out in pots or pans. It is very nearly if not quite hardy. Native of Siberia, China, and Japan.

STRAWBERRIES EARLY AND LATE, AND FOR PRESERVING.

Veay many thanks to Messrs. Gloede and Radclyffe, and also to "H.," for so kindly responding to my Strawberry appeal. Certainly I must have a wrong Oscar, as mine is a very late variety. I really wish that one could impose a very heavy fine on nurserymen for sending varieties untrue to name. It is no reparation for the injury done to replace the plants by true ones when told of the mistake, for a year is lost, and often great inconvenience caused. I obtained, two years ago, plants of Elton from an eminent London firm, and it turned out to be another kind—more like Kitley's Goliath, and quite a midseason variety. I hope I shall be more fortunate with Rifleman, recommended by Mr. Gloede, which I have ordered. Would he add to his kindness by informing me what London firm has his Unser Fritz, as I do not see it in any of the lists? I doubt the wisdom of his advice to us to discard Black Prince. I know of no Strawberry which develops so fine a flavour when preserved, though it is quite possible that Roden's Early Prolific, which I have just procured, may beat it as a dessert fruit. I think I have Cockscornb true to name. It is all he describes it to be, except that it does not with me reach an enormous size. It is about the same size as Frogmore Pine; as I said before, not nearly so large as Admiral Dundas, but this only proves that the same Strawberry will alter according to locality. For example, Brown's Wonder, so praised by "H.," is here below contempt. With the highest culture it produced only a few miserable, stunted, wizened, pale, tough berries, and after three seasons' trial was thrown away. Vicomtesse Héricart de Thury planted next to it was superb. Though I did not count them, I am sure there were more than a hundred berries on many of the plants. I know no Strawberry which gives so long-lasting a crop as the Vicomtesse. My plantation of this, facing west, did not come in till I had entirely gathered those in the south border.

Will Mr. Radclyffe kindly tell me what his largest Cockscornb ever weighed? Must not "H." have, like me, a wrongly named Strawberry? He speaks, or rather writes, of gathering his last dish from Prince of Wales, but in Messrs. Carter's list that variety is put down as an early one.

I take this opportunity of asking some light about the most prolific-bearing Strawberry I have. I received it from a neighbour, who has had it these seven or eight years under the name of Lady Carrington. I have looked, last year and this, through many lists, and have never seen that kind mentioned; and what I have is so good that it seems impossible that it should have passed out of the market. I feel inclined to think it is Wond'rin', from what Mr. Radclyffe says of that variety. It is a prodigious bearer, has rather a pine smack, is more acid than British Queen, has an uncoloured tip, is generally wedge-shaped but sometimes conical, and its leaf-stems are hirsute. I should be very glad to know whether it is rightly named Lady Carrington or not.

A great many of my Vicomtesse Héricart de Thury are coming into blossom a second time, not with a bloom here and

there, but with about twenty trusses of blossom to each plant. I intend to leave some on to see the result. I wonder whether, if one were to denude a couple of lines of their blossoms in spring, one would have a chance of a crop from them in September.—D. P. J. K.

I WAS rather taken aback on reading the Rev. W. F. Radclyffe's advice to grow Wonderful for culinary purposes; and as I believe the only way in which Strawberries are so used is by preserving, am I to conclude he means this? If so, I decidedly differ from him. Indeed, I do not know a variety I would not recommend before it. I think it totally unfit for preserving, aye, or to be grown in a garden at all, when we have so many kinds infinitely better in all respects, except, perhaps, as a large cropper; in this quality, too, it is equalled by many varieties which have valuable properties to recommend them. What single point has it to qualify it for a culinary Strawberry? If in any way Mr. Radclyffe's Wonderful has turned out so wonderfully good, I am disposed to think he is the only one who has found it so. I have never met with it good, nor can I grow it to be so. I had it at Maesgwynne in a heavy soil, I have it here in a light sandy one, yet in both situations it has been alike worthless. It is the worst to carry, to stand sun or rain, or to handle. Gather a dish and leave it an hour or two, and see the results. It decays in damp weather more than any other sort I know; it is spoiled in sunny weather sooner than any variety.

Mr. Radclyffe says in conclusion it is of fine pine flavour. Here I ask, What is pine flavour? Am I to take Elton to be the standard of what should be called pine flavour, or British Queen? Not that Wonderful is anything like either; to me it has a flat insipid flavour that is particularly disagreeable. Let me be understood only to give my own experience, as I doubt not Mr. Radclyffe has his?

Mr. F. Gloede's experiences with Nimrod are precisely mine. I well remember my father having it, as he did most other kinds. He proved it to be Myatt's Eleanor. A year or two afterwards I was working in the nursery from which it was sent out. The old man who took charge of the Strawberries assured me the two were not the same, and if his description of Nimrod was as true as that he gave of Eleanor they certainly must be distinct. I have myself met with it of a very different character. We obtained our plants from a London firm. Much talk there has been of what is the latest Strawberry we have. Though it is the earliest, for the last twenty years Black Prince has been also the latest, for I have gathered the fruit under hand-glasses when the glass has been frozen over. I despair of ever finding any later. With a north aspect I think we have Strawberries of good flavour as late as our weather will permit.—JOHN TAYLOR, *Hardwicke Grange*.

POTATOES AT SOUTH KENSINGTON, AND MISTAKES IN JUDGING.

THOSE interested in vegetable culture (and who is not? for even in gardens where flowers and plants are little attended to it is usually necessary to maintain a tolerably good succession of vegetables), Potatoes at least are universally grown, and acknowledged to be the most useful vegetable in existence. There is also an increasing number of amateur cultivators of the Potato who grow from twenty to a hundred and fifty distinct varieties, and they are quite as familiar with the distinctive features of each as the Dahlia or Gladiolus growers are with the foliage and flowers of the objects of their adoration. To the ordinary visitor one yellow Dahlia is exactly like another of the same colour, one red sort is the same as another, but the ardent cultivator who can name the different varieties from the leaves and habit of the plant, without looking at the labels or flowers, is not to be "taken-in and done for." To the amateur cultivator of the Potato the very large collections of handsome tubers exhibited on the 2nd inst. were a treat of no ordinary kind. Even the usual visitors to flower shows showed by the attention which they gave to the different collections that a "Potato tournament" is appreciated by the general public.

There were, as your readers who read last week's report are aware, two series of prizes offered for collections of "twenty dishes, ten round and ten kidney varieties." In the next class the reading of the schedule was, "ten dishes Potatoes five round varieties, five kidney varieties." It was univers-

ally understood that the dishes should be distinct sorts, and very great dissatisfaction was felt at the judging. Now if the schedule says that the dishes should be composed of distinct sorts the judging was wrong, and the exhibitors who received the prizes were not entitled to them in every case. The second prize was awarded to a collection which contained only eighteen distinct varieties. One dish was named Early Goodrich, and another Goodrich Kidney, they were both Early Goodrich; and the two dishes named respectively Cambridge-shire Kidney and Oxfordshire Kidney were the same. Again, the first-prize collection contained only eight distinct varieties in the ten class. Myatt's and Rivers's Ashleaved Kidney were the same, undoubtedly; and the dishes of Red Regent and Early Emperor were both Early Emperor. In the same class the collection to which the third prize was awarded had, apparently, only seven distinct varieties. King's Seedling, Aylesbury Wonder, and Foxe's Seedling were alike. Myatt's Prolific and Rough Kidney could also have been selected from one sort. No doubt there must have been error somewhere. The Judges read the schedule one way, and the exhibitors another. For my part I think the Judges must be right, and that they took it for granted that distinct sorts were not intended. Will you kindly look at the schedule, and say whether it should read, Distinct sorts of round and kidney varieties, or not? Throughout the whole of the collections not one of them contained two dishes under the same name—a plain proof that as far as the exhibitors were concerned they meant that their dishes should be considered distinct.—J. DOUGLAS.

CRYSTAL PALACE AUTUMN SHOW.

This commenced on Tuesday last and will close to-night. At the autumn exhibitions of years ago the whole length of the Palace was filled with flowers, comprising an immense array of Dahlias, Gladioli, Hollyhocks, Asters, &c., and with an equally large display of fruit, in which noble examples of Grapes figured prominently; on this occasion, however, the flowers form but a small proportion of the whole, while the quantity of fruit is not so large as in the past. However, we hail the re-establishment of the autumn Show, and with a revision of the schedule, which might be greatly improved, in the classes for Grapes for instance, we hope it will secure such an amount of support as will render it a permanency.

Collections of fruit come first in the schedule. Here Mr. W. Coleman, gardener to Earl Somers, Eastnor Castle, Ledbury, takes the lead with fine Black Hamburgh and Muscat Grapes, a nice Queen Pine, Victory of Bath Melon, excellent Peaches, Nectarines, and Figs. Mr. Bannerman, gardener to Lord Bagot, Rugeley, is second with a good collection; and Mr. Deuxberry, gardener to Lord Darley, Cobham Hall; Mr. James Neighbour, Bickley Park, Bromley; and Mr. O. Goldsmith, Polesden Lacey, Dorking, also find places in the prize list.

A class for not less than three Pine Apples comes next, and in this Mr. T. Jones, gardener to Her Majesty at Frogmore, takes a decided lead with four magnificent fruit of Smooth-leaved Cayenne. The same kind from Mr. Coulter, gardener to L. J. Baker, Esq., Haydon Hall, Eastcott, and from Mr. R. Plummer, gardener to R. Thornton, Esq., Merton, is second and third. For a single fruit of any variety, Mr. T. W. Bond, gardener to G. A. Smith, Esq., The Beeches, Weybridge, is first with a fine Queen of 6 lbs. 11 ozs., Mr. Jones being second with a handsome Smooth Cayenne. Third is Mr. A. Jamieson, Haigh Hall, Wigan.

The number of bunches of Grapes exhibited is disappointing, but the prizes were insufficient to tempt many exhibitors to expose their fruit during a three-days exhibition. In the Black class Mr. Coleman is first with fine beautifully-ripened bunches of Black Hamburgh; Mr. Potts, gardener to S. Mendel, Esq., Manley Hall, Manchester, being second with splendid bunches of Madresfield Court; and Mr. Bones, gardener to D. McIntosh, Esq., Havering Park, Romford, third with large bunches of Black Hamburgh, but not well coloured. In White Grapes splendid bunches of Muscata from Messrs. Lane of Berkhamstead are first, pressed closely by those from Mr. Coleman, which have the advantage in point of ripeness. Mr. Cole, gardener to J. S. Budgett, Esq., Ealing Park, is third with excellent large-berried bunches. Some good bunches are also shown by Mr. Bannerman and others. Prizes were also offered for the largest bunch of any kind, but the competition is extremely meagre. Mr. Bones is first with Black Hamburgh, weighing 5½ lbs., in reality two bunches from one eye; Mr. Bannerman

second with Gros Guillaume of about the same weight; and Mr. Earp, gardener to J. S. Sellon, Esq., Hume Towers, Bourne-mouth, third with Alicante 3½ lbs.

Peaches and Nectarines are generally small. In the former Mr. Coleman is first with splendid fruit of Barrington; Mr. Bannerman and Mr. Holliday, gardener to J. Norris, Esq., Bletchingley, carrying off the remaining awards with Bellegarde and Wallhurst Admirable. Mr. P. M. Parsons, Melbourne House, Shooter's Hill Road, sends three very large fruit of Lord Palmerston, together with the same number of Princess of Wales, grown in a cool orchard house. Of Nectarines the best are Pit-maston Orange from Mr. O. Goldsmith and Mr. Coleman, and Violette Hative from Mr. W. Gordon, gardener to J. Bonstead, Esq., the last named being second.

Melons are rather numerous, comprising Gilbert's Improved Victory of Bath, Colston Bassett, Golden Drop, and Beechwood in the green-fleshed class. Golden Queen from Mr. C. J. Goldsmith, gardener to H. J. Lambert, Esq., Bletchingley, is first; Victory of Bath from Mr. J. Mayall, gardener to F. Rowland, Esq., Epsom, second; and Incomparable from Mr. Chard, Clarendon Park, Salisbury, third. In Scarlet-fleshed the chief varieties are Gem, Moreton Hall, Read's, Royal Ascot, and Little Heath. The successful competitors are Mr. Pitts, Mr. W. Holder, and Mr. G. Harper.

Of Figs but few are shown. An excellent dish of Brunswick, from Mr. W. Chisholm, gardener to R. C. Taylor, Esq., Broughton Place, Maidstone, is first; White Ischia, from Mr. H. Mandy, Epsom, second; and Brown Turkey, from Mr. Coleman, third.

The best dish of Cherries is what appears to be Florence, shown by Mr. A. Parsons, Danesbury Gardens; fine Morellos from Mr. O. Goldsmith and Mr. J. Holder, Crown Nursery, Reading, coming in second and third.

Of Plums (three dishes) there is a good exhibition, the prizes offered being high. Mr. Coleman again takes the lead with splendid fruit of Washington, Jefferson, and White Magnum Bonum. Mr. Pitts, Riverdale, Dorking, is second, and Mr. Deuxberry third, with Jefferson, Washington, and Kirke's very good. Mr. Sage, Ashridge, is fourth.

The collections of four dishes of Apples are numerous, and though there are many fine specimens, the size on the whole is not so large as in more favourable seasons. For four dessert kinds R. Webb, Esq., Culham House, Reading, takes the first place with Ribston and Cox's Orange Pippin, and Red Astrachan and Devonshire Quarrenden, beautifully coloured, as these and several other varieties shown by him usually are. Mr. Holder, gardener to W. Balston, Esq., Maidstone, comes in second with Margaret, highly coloured, Kerry Pippin, Golden Pippin, and Cox's Orange Pippin, fine. Third comes Mr. A. Longman, gardener to E. D. Lushington, Esq., Maidstone, with King of the Pippins, Cox's Orange Pippin, Devonshire Quarrenden, and Red Astrachan.

For kitchen varieties Mr. J. R. Swinnerton, Swanley, Sutton-on-Hone, takes the highest position with large specimens of Blenheim Pippin, King of Apples, Early Marie, a large yellow Apple, and an unnamed kind. Mr. Chaff, gardener to C. H. Goschen, Esq., Addington, Croydon, is second with very good specimens of Lord Derby, Lord Suffield, and Dumelow's Seedling; Mr. H. Mandy is third.

Pears also are pretty numerous, although we have seen them much finer. Jersey takes the lead for three dishes of dessert kinds, the exhibitor being Mr. C. Tivey, gardener to P. Gosset, Esq., St. Saviour's, who has Louise Bonne, Williams's Bon Chrétien, and De Coq. Mr. W. Strong, gardener to H. Yool, Esq., Weybridge, comes next with fine examples of Louise Bonne and Williams's Bon Chrétien, and these two varieties are also well represented in the third-prize collection from Mr. A. Longman. The heaviest dish is Grosse Calebasse, 9 lbs. 13 ozs., from Mr. W. Jordan; next come Beurri Clairgeau and White Doyenné, respectively from Mr. Stephenson and Mr. Tivey, but the weights are not stated. For flavour the awards went to Louise Bonne from Mr. Strong; Beurri d'Amanslis from Mr. Sage, Ashridge; and Williams's Bon Chrétien from Mr. J. Lane.

Well-fruited Vines in pots are shown by Messrs. Lane, and take a first prize; and Mr. Webb of Reading, has an extra prize for a large collection of Nuts, whilst a first-class certificate was awarded by the Judges to Messrs. Brown, of Stamford, for Peasgood's Nonsuch Apple, of which a figure and description were given in vol. xxiii., page 310.

There are also classes for cottagers, in which there are very good exhibitions of Potatoes, Carrots, Onions, Cabbages, and Cauliflowers.

In the Floral department there is a very good exhibition of Gladioli, although for growers in the south of England it is too late. The only exhibitors in the class for thirty-six are Messrs. Kelway, of Langport, Somerset; and Mr. J. Douglas, gardener to F. Whitbourn, Esq., of Loxford Hall, both showing the largest proportion of seedlings of their own raising, and taking the prizes in the order of their names. In Messrs. Kelway's stand Duchess of Edinburgh, Mr. Wilkinson (first class certificate),

James Kelway, Neogenes, Protheus, Serapis, and Amazon are distinct and very fine in quality. In the second-prize collection Maiden Fair is a distinct and pleasing flower; Honore Vernet, Orphée, Meyerbeer, and the good old sort, Madame Furtado, are conspicuous.

In the open class for twenty-four Messrs. Kelway are again first, and the Rev. H. H. Dombain, Westwell Vicarage, second. In his stand is a magnificent spike of *Le Vésuve*, one of M. Sonchet's, to which a first-class certificate is deservedly awarded. In the amateurs' class for twelve spikes Mr. Douglas, who is the only exhibitor, shows some splendid spikes. Maiden Fair is again to the front. Adolphe Brongniart is also very fine. In the class for six new varieties not in commerce Messrs. Kelway are first. Two of their flowers had first-class certificates awarded to them. Duchess of Edinburgh is probably the largest spike and flower of any yet exhibited; the colour is a very pleasing purplish rose with deep violet throat, the petals lined with white. Mr. Wilson is a finely shaped flower, with a bluish purple ground flaked with crimson. Mr. J. Douglas is second. Two flowers in his stand also obtain first-class certificates. Manfred is a grand flower with a long spike; colour orange-scarlet, with a very deep narrow throat. Warrior is also a very brilliant flower, scarlet and white throat; the petaline segments distinctly lined with white, lip white. Mr. H. Coppin, Rose Nurseries, Shirley, Croydon, is third.

Of Dablias, Show, Fancy, and Pompon, Mr. Turner of Slough sends, not for competition, a fine collection, and takes certificates for Rob Roy, Pollie, and Warrior, as well as an extra prize; and like awards were made to Messrs. Downie & Co. for a charming group of Palms and fine-foliaged plants, the same firm also showing cut Phloxes; and to Mr. Coppin for cut Roses.

There is also a very interesting show of bees, honey, and bee appliances, which we shall report upon next week. A list of the awards will be found in another page.

COPROSMA BAUERIANA VARIEGATA AS A BEDDING PLANT.—I think it is not quite so well known and extensively cultivated as it ought to be; one often sees in many collections a fine plant staged in a greenhouse, and seldom so well grown as to be of any service; but it seems to thrive admirably treated as the generality of bedding plants. I was supplied with two plants from a friend last year, and the thought struck me that, as it seldom did well in a pot, it might do as a bedding plant. I increased my stock to as many as I could, and this year put a few out to form a panel in a short border; the result is that it has grown luxuriantly, and the pretty gold and varnished-like foliage forms a grand contrast amongst other bedding plants. It should be allowed to grow and not be pinched, but requires to be pegged down to keep it in place. It is easily propagated from cuttings of the points of the young shoots with four or five eyes, and put in sand in a brisk bottom heat.—R. GREENFIELD, *The Priory, Warwick*.—(*The Gardener*.)

THE BEAUTIFUL AND USEFUL INSECTS OF OUR GARDENS.—No. 24.

AMONGST some of the orders of insects, we find it to be the case that a good number of the species included therein prey upon other insects nearly related to them. Flies attack and devour flies, and beetles are often the enemies of beetles, and bees "improve the shining hour," not always by gathering honey," but by proceedings which tend to the destruction of relatives belonging to the Hymenopterous order. The Lepidoptera, in comparison to these, are peaceably inclined; yet, though we may regard butterflies and moths generally as a handsome, good-natured, somewhat indolent race, there are exceptions, and in the caterpillar state a few do prey upon their brethren, possibly under circumstances which demand our gratitude. At least this is certainly the fact with the Dunbar (*Cosmia trapezina*), a species, let it be noted, that does not take its name from any connection between it and the place in Scotland immortalised as having been the scene of one of Cromwell's greatest battles, but is so called from a conspicuous mark or band upon the wings. This moth usually appears in July and August, and being rather apt to vary in colour, it is frequently a puzzle to the young insect-hunter, the fore wings being sometimes grey, sometimes rust-colour, and occasionally brown, though we can usually trace out the "dun bar," marked-out by two dark lines crossing the wing, one having a pale inner border, and the other a pale outer border; the "discoidal spots" are enclosed in this bar or band.

The caterpillar of this species is to be taken on Oak, Elm,

and various trees of the wood, the park, or the garden; and though a leaf-feeder at times, by habit it is essentially carnivorous, its particular fancy being the larvae of that pest, the Winter Moth (*Cheimatobia brumata*); still, any other smooth-bodied caterpillar of suitable size is acceptable. So determined is the caterpillar of *C. trapezina* in the pursuit of its prey, that when one is shaken from a tree or bush into the net by a blow of a beating stick, it scarcely takes a moment to recover from the shock, but at once begins to chase after some other caterpillar that has also fallen, and should that have doubled-up in alarm, it has a poor chance of life. On the tree, however, the larvae of *C. brumata* succeed in escaping their enemy at times by rapid crawling, or by suddenly dropping from a silken cord, which baulks the pursuer. As the larva of this moth does not eat its prey "clean up," but mostly contents itself with imbibing some of their juices, one of them can in its life of about two months destroy a good many other larvae. Though there is no doubt that many of the young of *C. trapezina* are killed in April by the cold winds and rains of spring, yet such an average number survive from year to year as to make the moth tolerably common, and it seems to occur throughout the British islands. This caterpillar, which is full-grown in June, has a very smooth, shining head ("with an evil look about it," I have been told; it does not strike me in that way), and a stout body of a green hue, freckled over with numerous black warts, usually arranged in order, eight on each segment. There also five white stripes running from head to tail, these are occasionally tinged with yellow. The under surface of this larva has a transparent appearance. Having descended to the ground, the larva entombs itself there, not going to any depth, but drawing the earth over the slight cocoon of silk which it makes. The chrysalis is brown, and covered with a bloom which resembles that on a ripe Plum. Probably the microscope would resolve this into fine scales.

The rather larger moth designated the Satellite (*Scopelosoma satellitia*), has also strong cannibalistic propensities in its early stage of growth. This is a moth of dingy aspect, with "scalloped" fore wings of reddish brown crossed by dark lines, some of which are indistinct. There is a conspicuous white spot near the centre, sometimes accompanied by two smaller ones, and individuals are now and then taken that have these spots of a bright orange. The perfect insect emerges from the chrysalis in October, and, after being about a short time, hides in some cranny during the winter months, and reappears in March, when the eggs are deposited. The caterpillar has not the placidity of the one just mentioned, but when exposed to view is greatly excited and endeavours by all means to escape observation, wriggling about if handled, and backing-off in alarm if a finger approaches it when it is at rest. This habit is to be accounted for by the fact that the larvae of the Satellite do not live exposed, but form a nest for themselves among the leaves, from which they issue on foraging excursions, mostly at night we may presume. The parent moth deposits its eggs on several species of forest trees, and also on the mixed hedges common in England. Unlike *C. trapezina*, this caterpillar is tolerably slender, of a deep brown colour, with a few scattered white spots, and some faintly-marked lines or stripes along the body, the under surface and legs being decidedly paler than the back and sides. Mr. Newman has found that these creatures will seize and devour their immediate relatives if other fresh food happens to be scarce, and Mr. Buckler has recorded his unhappy experience in rearing a brood of *Tanio-campa Populiti*. He had fifty-seven to start with, and for a time all went on well, they grew and were thriving, until by degrees the number diminished. He could not make it out, and fancied he must have thrown away some with the dead leaves; but as the daily reckoning still became less and less he was puzzled, and ere long it got to be none at all—only a few spots of moisture appeared on the leaves. This led to a regular turn-out of the jar, and lo! at the bottom lay a Satellite larva snugly coiled-up, and happy in the consciousness of having cleared-off the whole fifty-seven of his captives, so that he could feel he was "monarch of all he surveyed." Such a "satellite" it might be worth a gardener's while to encourage, and if it could be induced to breed more numerously about cultivated ground we should be the gainers. According to M. Guerece, on the Continent the larvae of *S. satellitia* feed on low plants towards the end of their life, and, of course, also on the larvae to which these furnish food. They are adult during June with us, and seem tolerably plentiful throughout Britain, though at present found more frequently in open places than in enclosed ground. Still, the species deserves to

be reckoned among those they are friendly to horticulture, as its staple food is other caterpillars.

Two communications have recently been made to the "Entomologist" on the subject of the colonisation of glow-worms, for it has been thought by some persons that, seeing the species is very destructive to snails, it would be a valuable insect in the garden during its stage of growth, and also, when developed into the perfect condition, form an object of interest and amusement on the bank or lawn. This species, properly no worm, but a beetle, and bearing the scientific name of *Lampyrus noctiluca*, the generic appellation from the Greek signifying "shining tail," and the Latin we may freely translate into "night-illuminator," is known in many of our southern counties, yet is rather rare in the north of England I believe. Seen by the hedgesides, and sometimes in wood-openings during the summer months, the glow-worm has often excited the enthusiasm of the stroller in the country, and led him to perpetrate some effusion in prose or verse, with the usual redundancy of adjectives and unmeaning epithets. It has certainly also inspired nobler minds with ideas, such as Cowper, Gilbert White, and Johnson; and though there are occasional instances of luminosity in other species of the beetle tribe, and in centipedes (and the eyes of many moths are lustrous after dusk), the glow-worm is the only British insect that is a light-producer, and reported to be so in all stages of its development. I say reported, because as yet I am hardly prepared to give credence to the assertion that the eggs are luminous, though there cannot be a doubt that the larvæ exhibit, possibly throughout their life, a pale light, which is more like that emitted by the male beetle than the steady brilliant light of the female and wingless insect—steady at all events so long as the insect wills, for it is

able to suppress it at pleasure, much to the astonishment of the rustic lad, who, eager to pick up this "star of earth," seeks in vain for it in the grass after it has withdrawn its light in alarm. And this power is not one of the least remarkable circumstances in glow-worm history.

There has been almost as much discussion as to the nature of the glow-worm's light as about its intent. Philosophers are divided as to whether it is caused by a kind of slow combustion, by phosphorescence, or by some other chemical decomposition which produces light in the same way as does the slow oxidation of phosphorus. Introducing it into oxygen gas, gives increased brilliancy; and Dr. Todd, who went in for several glow-worm experiments in 1824, found that when removed from the insect, the organ continued to shine for awhile, and when the light was apparently quite extinguished, heat, friction, electricity, or the application of either camphor, ammonia, or alcohol, provoked it to show itself again. I think, on consideration, we shall agree that there is force in Mr. Newman's remark when he writes, "The universally received hypothesis that the light of the female glow-worm—like a chignon, a pannier, or a crinoline amongst ourselves—is a lure to attract the male, requires investigation." The luminosity in a degree in the larvæ, pupæ, and males, tells against this notion. Another well-known entomologist, Mr. Wood, expresses the like doubt, and grants that it is unfortunate to have to disturb so poetical a theory. He adds, "I believe that the phosphorescence was given to it for the same

reason that the butterfly's wing glows with many-coloured plumage, and the Rose is dowered with softly-tinted petals and sweet perfume."

Glow-worms are seen during the summer months. A popular belief associates them with the season when the nightingales are in full song. They are not often noticed in August, and quite exceptionally in September. The females (true beetles, though so dissimilar to their partners) are flat soft-bodied creatures, black in colour, and with a few pale spots along the sides of the segments. The legs and antennæ are short; and, taking it altogether, we are not astonished it has been supposed to be a larva or grub. A close investigation proves that the light proceeds from the hinder segments, and observers have variously described it as white or greenish. Those who visit woods at the evening hour report that they have often met with or captured male glow-worms, though they are frequently lacking in collections of our native beetles. Like the females, they are soft-bodied, but have the legs and antennæ more developed, and the usual wings and elytra or wing-cases. The light in these insects is confined to the head, and exists there as two small spots merely, that it has not much brilliancy. One judges from the denial in some quarters that there is any luminosity in the male glow-worms; but the evidence is sufficient to my thinking, though I regret I have not personal acquaintance with the insect. The eggs, according to Mr. Newman's observations, are dropped casually by the beetle, without any regard as to the object on which they may rest, and to which they adhere by a gummy secretion. No sooner do the young larvæ emerge than they begin to eat; their food throughout their existence in that state being the land molluscs, especially of the genus *Zonites*,

FIG. 71.—METAMORPHOSES OF THE GLOW-WORM.

though both the shelled and shell-less types are attacked, and it is conjectured that when not feeding the larva conceals itself in the shells of snails, which would account for the infrequency of its discovery by naturalists. It also devours the eggs of snails—a valuable piece of service. Several descriptions have been given of a curious telescopic apparatus with which the extremity of the body of the glow-worm larva is provided, and which, when it is pushed out by the larva, expands at the end into a little brush. This is employed as a help in locomotion—a sort of extra leg—and also as a cleaning appliance, to remove deposits of slime and dirt that may have got upon the body, and that cannot be otherwise reached. We do not positively know how long the larval life lasts, but as beetle larvae are generally of slow growth, it is likely these are hatched the year preceding, as they enter the pupal state in April.

At present, then, the glow-worm is only prospectively a garden insect. Could the species be introduced commonly it might claim to be both beautiful and useful; for not only the larvæ, but the females are devourers of molluscs; the males, as is thought, are flower-lovers. All that has been done yet has been the transfer of females from the open ground to the garden lawn, and the light has been seen for a number of nights subsequently, getting paler till it died out; but no larvæ or beetles have followed these in the next season, showing that if eggs were deposited they had failed to continue the race in that spot. The best way would be to get a good number of larvæ, could that be done, or else the eggs, and place these in

a suitable position—not too dry a place would be a desideratum, the insect is partial to moisture. It would be a new feature in a garden fite to have the grounds lit up at dusk with hundreds or thousands of glow-worms.—J. R. S. C.

THE PLANTING OF VASES.

VASES and other sorts of sculpture for the decoration of the pleasure garden about the house or mansion are quite a leading feature in many places. The villa garden in the suburb of some manufacturing town is often particularly rich in them, exhibiting the genius of the brickyard artist in attractive colours, generally shades of red or yellow, and designs rich and original. Vases of good design are highly ornamental when well filled and standing in positions suitable to them—for instance, along a terrace wall, by the side of a flight of steps, or in central positions in an architectural garden. Vases seldom look well crowded too near the mansion; they require space. A garden must be of very considerable extent to admit of the introduction of many vases; a small garden, therefore, can have but very few or none at all; they are often seen sprinkled about small gardens in glaring violation of good taste.

Vases are now made of various materials: the best are made of marble or a good sandstone; next to stone we class cast iron painted. There are also some exceedingly good qualities of terra cotta, which look and stand well, and the designs of some makers are very beautiful, chaste, and in good taste. All cements, terra cottas, and compos are to our mind only varieties of one general form, and that is included in the word plaster; and therefore we are prejudiced against them, though we are quite aware that many fine specimens of art are made in plaster and terra cotta; for the present we object to vases made of any variety of plastic material.

Vases for flowers are made of various shapes; the shape will determine the way in which the vase will be filled. There is the flat shallow vase with wide brim, inviting you to hang a fringe over the edge, and a little garden of plants gently swelling over its surface; then there is the tall deep vase, which a giant might catch in his hand, pedestal and all, and out of it—for giants are not Good Templars—take his morning nip of wine. Such vases should be planted fountain-like, plants tall and spreading. Then there are vases intermediate between a cup and a bottle, tall, with a big belly and contracted neck, with perpendicular-looking handles or ears; these should be planted with something tall in the middle, with dwarf and trailing plants frothing over on the shoulders of the vase. Again, there are vases of all intermediate shapes, some flattish, with swelled bodies and rather contracted necks; some are neither the one thing nor the other, but capacious, with exaggerated freedom of handle; some are Tulips and Water Lilies in design, some ornamented with goats' heads and griffins; some are encircled with the heads of divines and philosophers, with ample flowing beards and eyes of sleepy gravity, expressive of great wisdom, which ultimately get obscured when the tresses of Minnie Warren or the sprays of L'Elégante fall over them.

As a rule, flat vases should be planted with dwarf plants, giving the vase at a distance a flat rounded outline. Tall vases should be planted with tall things in the centre, modifying the manner of planting with the intermediate shapes. A tall, cup-like vase would look poor with a short flat bouquet of flowers growing on the top of it; but with tall fountain-like plants in the middle, with the rim gracefully covered with some trailing plant, it will be a pleasure to look upon. A flat shallow vase planted with tall plants would look even worse, or propped up to a pyramid like the top of a wheat stack.

We have tried various modes of planting vases; we have had immense bouquets of one sort of plant, which were showy enough from a distance, but vulgar; planted in rings of colour ribbon fashion is perhaps worse. In almost every instance, except when the vase is very small, and a single plant sufficient, it is much the best to use a mixture of plants.

We come now to say something about the materials for filling vases. Ours, like the flower-beds, are filled twice a-year, in summer at the bedding-out time with summer-flowering plants, and again in the autumn with hardy plants. The summer lot are all of the same character as the bedding plants, of which Geraniums are the staple for the vases; but we find that as a rule the cuttings of the autumn are not of much use. Large plants in small pots are the best, the top fills out, when for the time the root occupies but a small space. Lifted plants from the beds in the autumn, of whatever sort, can always be put into small pots and kept so throughout the winter; this

applies to *Mesembryanthemums*, Ivy-leaf *Geraniums*, *Abutilons*, *Gazanias*, *Cineraria maritima*, *Centaurea gymnocarpa*, *Tropæolum Minnie Warren*, and others, as well as to the general run of *Geraniums*. A special eye must be had to plants for vases where there are many to fill, else there will be disappointment when the time of filling comes. Much can be got ready in spring and grown into the desired size, such as common *Tropæolums*, *Lobelias*, *Petunias* from seed, *Calceolarias*, *Verbenas*, and cut-back *Fuchsias*; there is quite a wealth of plants suitable for vases when prepared for the purpose. But the chief point is the tasteful planting of the vase; these, like flower-pots, should be provided with a hole in the bottom to take off superfluous water, although it is seldom they get overwatered; a small pot may be put over the hole, mouth downwards, or a few large crocks, just to prevent the hole becoming stopped up. Many crocks are objectionable, except when the vase is very deep and bottle-shaped.

The soil used should be a mixture of fresh fibrous loam and rotten dung, the richest which can be had, the soil to be put into the vase as the work of planting proceeds. It is convenient for the work and for comparison to collect all the moveable vases to one place where the heap of soil is, and the plants at hand for selection as wanted; the work of filling goes on more expeditiously. In planting, begin at the rim with the plants which are to hang over the edge. *Willsii rosea*, Ivy-leaf, L'Elégante, Duke of Edinburgh, Minnie Warren *Tropæolum*, and *Lobelia*, make a fine mixture for a bottom row to hang down; the old pink Ivy-leaf *Geranium*, *Mangles' Variegated Geranium*, long plants of *Gazania* and *Abutilon vexillarium marmoratum*, with *Cineraria maritima* and *Lobelia*, also make rim plants. The next inwards may consist of *Coleus*, *Centaureas*, *Calceolarias*, *Fuchsias*, and various *Geraniums*, choosing the plants as to size until the vase is finished. But we do not care for finishing a vase with one conspicuous staring plant in the centre, as is sometimes done. It is often necessary in planting vases with a bulging shoulder to run two or more thin wires round on which to tie on the hanging plants to prevent them being chafed to pieces by the wind; they also look much better regulated and tied down; some done in that way here are much the most effective, for although tied they still appear to hang. For the centres of tall vases *Acacia lophantha* is very useful with a piece of bare stem, to which can be tied the long sprays of *Abutilon vexillarium marmoratum*. The variegated Japanese Maize also suits well; pyramidal-shaped *Fuchsias*, the narrow-leaved *Dracanas*, *Humea elegans*; also for such vases long plants of the semi-trailing *Geranium Orange Nosegay*, *Centaurea gymnocarpa*, *Salvia patens*, with a few plants of *Petunia* to fill up the bottom and hang gracefully over. Few plants are better adapted for vases than *Petunias*; they flower more profusely when pinched for root room, but water must be supplied liberally; indeed, the question of watering must always be particularly attended to, and with a liberal hand. Sometimes it will be necessary to soak the vases thoroughly twice a-day; if once allowed to get too dry their beauty is marred for the season. After midsummer weak liquid manure should be given every time they are watered; if allowed to get seedy and be starved, instead of an ornament they are a decided eyesore.

Vases for winter can be filled in various ways: first of all, dwarf shrubs can be used entirely; one shapely *Rhododendron* will fill a vase at once, or a mixture of small things may be used. The pretty *Erica herbacea* makes a nice winter edging, and the various *Vincas* and *Ivies* for hanging over; we used *Aucubas* and *Retinosperas* largely last winter. *Retinospora pisifera aurea*, *Euonymus radicans variegatus*, *Erica herbacea*, *Iberis sempervirens*, and *Iberis Tenoreana*, are stocky little plants which work well together in filling vases. *Festuca glauca* in thick tufts also works well with these, but it loses its blue colour in winter. None of these seem to suffer much when the soil is allowed to be dry. They were never watered; and if the soil is raised in the middle and made hard on the surface, much of the rain runs off. The chief feature last winter, however, in the way of vase-filling was in the use of hardy succulents for low flat vases, such as *Sedums glaucum* and *lucidum*, *Sempervivums californicum*, *montanum*, and the common *Houseleek*; *Saxifragas*; also variegated *Thyme*, *Pyrethrum Golden Feather*, &c.

In planting vases at all times we never make any allowance for growth, but plant thickly and make them look full at once; the plants then support each other, they have plenty of room to extend themselves outwards, and the effect improves as they get interlaced. If possible it is always better to group the

vases in some shady sheltered place for a few weeks after filling in summer, before being placed on exposed places on terraces in the blaze of the sun; this is not so necessary in the case of large vases with a large body of soil.—THE SQUIRE'S GARDENER.—(*The Gardener.*)

SAGO.

Sago is nearly pure starch, obtained from various species of Indian Palms. In the Indian Archipelago it is procured from *Sagrus Rumphii*, *Sagrus lavis*, and *Sagrus genuina*; on the Coromandel coast from *Phoenix farinifera*; in Ceylon from *Corypha umbra-culifera*; and in Assam from *Caryota urens*.

These trees are cut down, and from the pith filling their stems the sago is extracted. The pith is thoroughly washed, and from the washing, when allowed to rest, the fecula or starch subsides; this is the sago flour of commerce, of which large quantities are used in the manufacture of calico. When used as food it is granulated, and known as pearl sago. Tapioca is really sago in lumps, and was so called merely because the French, who introduced it from India, named it *Sagou-tapioka*. About eight thousand tons of sago are annually imported.

Sagrus Rumphii (fig. 72), is a small tree, comparatively speaking, not above 30 feet high. It is a native of the Indian Archipelago, particularly of Malacca, Borneo, Sumatra, Celebes, and the Moluccas. Before the tree has arrived at maturity the stem consists of a mere shell, about 2 ins. thick, filled with a great mass of spongy pith, becoming gradually absorbed, and ultimately the stem remains hollow. At the time when the pith is fully developed, and before it has begun to diminish, which is indicated by the superior leaves being covered with a sort of farina or white dust, the tree is felled, and the trunk cut into lengths of 6 or 7 feet long, which are split to admit of the pith being more easily removed. The pith is in the state of a coarse powder, and is mixed with water in a trough having a sieve at one end; the water, loaded with farina, passes through the sieve, and is received in convenient vessels, where it is allowed to stand till the insoluble matter has subsided. The water is then strained off, and the farina which is left may be dried into a kind of meal, or moulded into whatever shape may be desired. Sago, as it comes to this country, is prepared by forming the meal into a paste with water, and

rubbing it into grains; it is produced in the greatest abundance in the Moluccas, but of the finest quality on the eastern coast of Sumatra. The Chinese of Malacca refine it, so as to give it a fine pearly lustre, and large quantities are also prepared at Singapore. It is said that a single tree will yield from 500 to 600 lbs. of sago. Sago forms the principal food of the natives of the Moluccas. A decoction of sago fermented yields alcohol by distillation, and by ascension it forms vinegar. The fruit of this Palm is the size of a hen's egg. The base of the leaf-stalks is covered with long fibrous filaments, that serve to make cordage and sacking.

Fig. 72.—SAGO PALM—*SAGRUS RUMPHII*.

NOTES AND GLEANINGS.

THE growth of TEA AND SUGAR IN EUROPEAN soil are perhaps branches of culture which we can scarcely expect to be remunerative in a commercial point of view. Be this as it may, the Sugar-cane is now grown and sugar manufactured to some extent in the neighbourhood of Malaga, Spain. Tea has also been introduced into the southern districts of Sicily; and though the first attempt made last year to raise the plants on a large scale was not successful, owing, it is said, to the injury caused to the plants and seeds by immersion in sea water on their transit from Japan, it is confidently hoped and believed by the promoters that another attempt with healthy seeds and plants will prove quite successful. Meanwhile Tea is being grown at the Cinchona plantations in Jamaica, and a sample has recently been received at the Kew Museum, which was grown and manufactured as above from Assam

Tea plants received through Kew in 1868. So far as the appearance of the sample is concerned, it is roughly manipulated, not being sufficiently twisted or curled, and apparently not sufficiently roasted. Nevertheless, its manufacture is little inferior to that of the earliest samples of Assam Tea that appeared in the English market. Its quality, however, is another thing, for it produces a very watery infusion of a very herby flavour, and devoid of the aroma for which Tea is noted. Care, however, in the cultivation of the plant, as well as in the selection and manipulation of the leaves, may in time produce a more marketable article.—(*Nature.*)

—*Nature* remarks that the *Oenro* (*Abelmoschus esculentus*), a Malvaceous plant, is well known in all tropical countries, being cultivated for the sake of its fruits, which are

gathered in a green state, and either boiled and eaten as a vegetable, pickled in vinegar like capers, or used for thickening soups on account of the mucilage they contain—a common property of the Malvaceæ. In India the seeds are sometimes boiled for making a mucilaginous drink. But we now learn that a fine oil has recently been discovered in them of a quality equal to olive oil, and that it is intended to introduce this oil to commerce. Supposing the oil to be all that is said about it, the question arises as to the supply of seeds. Though the plant is easily cultivated, can it compete with other oleaginous plants?

NOTES ON LIFTING AND ROOT-PRUNING FRUIT TREES.—No. 3.

ALL the stocks employed for dwarfing are of the free-rooting character, and all succeed in catering well for the head. I cannot say that all kinds upon these dwarfing stocks are alike improved in bearing, and at an early age comparatively with those on the free stock. Some varieties of both Apples and Pears are not more productive at an early age than they are on the free stock, exception being made of periodical lifting, which I shall consider presently.

I shall conclude that the dissimilarity in the influence of the dwarf stock, causing some kinds to be productive at an early age, whilst early bearing in others is not promoted, appears to rest solely on the harmony between the growth of the stock and scion being incomplete or the reverse. The dwarf stock with the majority of kinds of Pear, Apple, and Cherry, also the Apricot, Peach, and Nectarine, acts upon them much in the same manner as ringing, but to a less marked extent, and in a more natural way. The roots are plentifully produced, very active during growth; and in the resting period during mild weather more or less fresh ones are originated. Sap is sent up freely to the head; it is patent the descending current is arrested at the junction of the stock and scion, the scion not growing in equal proportion to the stock, for the stem of the latter is considerably less, often not more than half the thickness of that of the scion immediately above the point of union. In no instance have I noticed the stem of the Pear and Apple on the free stock greater in thickness than the stem of the stock; but on the contrary, I have observed the stock stems considerably larger than the scion stems. I have noted the stems of some Cherries to be more swollen than those of the free Cherry stock. Cases of the stock outgrowing the scion are much more general upon the free stock than those of the scion outgrowing the stock. The greater growth of the scion where the trees are on the dwarf stock acts, I think, as before stated, in the same beneficial way on the quantity, size, and quality of the fruit as ringing does; the head receives and appropriates sap to sustain the fruit and foliage, and form the means of production in future years, the stock being deprived of the benefit, if any, and there is some, of the descending current.

I shall not call in question the great benefit to the head arising from the descending sap or current being arrested; but I may say that it is this descending current which gives life to the parts it traverses, and it is not warrantable to suppose that the stem of the stock will be weakened by its obstruction, and ultimately fall into premature decay. I am not able to advance a great deal in proof of this occurring. I know it has been asserted that Pears on the Quince are not noted for longevity, but I have not observed anything more than a few solitary instances, which were certainly cases of the death of the stock from lack of the descending current, the scion taking and appropriating all in foliage and fruit. That the Quince stock is productive of disease, and shortens the age of the subjects upon it, might by a few solitary cases appear established; but then we can find as many showing that the dwarf stock induces health and life, notably in the Ribston Pippin Apple. Rarely on the free stock is the fruit otherwise than large, or the tree free from canker, whilst on the dwarf stock it has not the tendency to canker, the tree having a remarkably healthy appearance, and producing fine well-coloured fruit.

Mr. Knight, I think, attributed the earlier bearing and extra production of finer fruit by the Pear on the Quince stock to the working on a foreign stock, making no allusion to the arrest of the descending current by the stock, which acts like ringing, only in a less degree. Some kinds of Pear will take well on the Hawthorn, but this does not prove the resulting fruitfulness to be otherwise accounted for except by the stoppage of the descending sap, for we may operate with a

scion equal in vigour to the stock with no greater benefit than were it on its own roots. The art of employing the foreign stock, so as to continue the subjects in fruitful vigour and longevity, appears, except in one quarter and by one person, to have received little attention. Mr. Rivers has, it seems to me, alone observed what kinds of Pear do not succeed well on the Quince. Some kinds do not, Mr. Rivers tells us, and after observing the kinds, he first grafts the Quince with a Pear which takes well on it, and then introduces the other variety that does not. As certain Pears do not succeed on the Quince, the union of the growths being so incomplete as to cause early decay, this goes far to show that the descending sap is very greatly arrested, and life almost as soon stayed as in the process of ringing. With the facts before us that some kinds of Pears do not succeed on the Quince stock unless it has been previously worked with a Pear that grows freely on it, it behoves planters to be on the alert, and have varieties on their proper stocks. I do not forget the fact that few propagate their own fruit trees, mostly purchasing them when two, three, or more years old, or in a bearing state, and from a neighbouring nursery: hence the importance of making sure that the trees are on the proper stock; if they are not, what are we to look for but unproductiveness—failure? The proper subjects to select may be known by a perusal of the "Miniature Fruit Garden." But if not troubling the veteran fruit-grower too much, I should be glad if he would give us a list of a dozen kinds of Apples, the same of Pears, Plums, and Cherries, free bearers, large in their respective kinds, combining bulk with quality, hardy dessert, and culinary kinds, not kinds for the few, but for the million, fruit that will alike fill the eye and satisfy the palate. Fancy kinds we have too many of, and know too much respecting their indifferent bearing, small fruit, and unsuitability for many positions in our uncertain climate.

With trees on dwarf stocks and suitable kinds there is no difficulty in getting them to bear from the time when fruit buds are first formed if two things are done—they must not be allowed to overbear themselves either by carrying too heavy crops of fruit or of blossom. Allowing a tree to perfect an immense crop weakens it—makes it aged at a rate no other thing does unless it be ringing, which ends in death shortly after the crop is matured. When a tree produces a vast amount of blossom it is ageing too fast, and should have the flowers thinned, or it may, and for years succeeding, leave off bearing, and become as enfeebled as one overlaid with fruit. Second, the growths must not be allowed to become free, much less strong. The strongest shoots of a bearing tree never should exceed 9 inches in length, and they are sufficiently vigorous if they make from 4 to 6 inches of growth, I mean the young shoots. If the growths do not exceed the latter extent the tree will stand, with a crop of fruit, liberal treatment—namely, frequent top-dressing during the season of rich compost or manure, and free watering in dry weather with water if top-dressed, or with liquid manure if not top-dressed. This feeding is very necessary to the trees, and for two reasons: First, it stimulates the roots, causes them to be produced, induces them to come to the surface for the humus of the top-dressing, and keeps them active, and no check to the growth of the fruit in a dry period is sustained. Should the shoots annually grow more than 9 inches it is evident the roots are extending too far and deep. They require to be brought nearer the surface, and lifting should be resorted to—in fact, I find that lifting is the only cure for unfruitful trees on the dwarf stock. It does not matter if the trees are 9 feet high, and have not been moved for the last seven years, they will move quite safely; but in the following year they will bear but little, if any, fruit, yet the growths will be good—not more than from 3 to 6 inches long in the most vigorous tree, and almost every spur will form itself into a fruit bud, and in the next year a good crop of fruit may be expected, and will be produced if no mishap occur, as frost.

It does not answer to have trees on the dwarf stock and allow them to grow at will. In some soils and situations they fruit freely without recourse being had to lifting, but in the majority of cases they grow too strongly to be free-bearing. Besides, if a tree grows strongly it does not afford correspondingly fine fruit, though the tree needs to be vigorous in order to perfect a full crop of fine fruit. It may be vigorous in having an abundance of large leaves borne on short stiff shoots or spurs, and these are what are wanted, not growth of considerable length, which may have to be shortened two or three times during the summer to keep it within bounds, and allow of a prospect of fruit some time. If this kind of growth be

made, it is of no use whatever trying to obtain fruit by curtailing the head. Cutting the shoots do not fashion the roots, but the roots make the growth of the head what it is. Place them in a soil where they will, by having to find their way through firm rich ground, become much divided; stiff short-jointed growths will be the result, with broad healthy foliage and a preponderance of fruit buds. Have them in a rich open soil, the roots will ramble and the head will be straggling.

Root-pruning with trees on the dwarf stock I do not comprehend, as nothing more than a spade is needed to cut off every root in opening-out the trench to just as far as the majority of the branches extend, any loose soil being removed. The spade may then be driven under the ball at about a foot to 15 inches below the surface roots all round, and with the spades (it may take two for a tree 9 feet high) under one side, lifting the handle upwards, and the head being drawn over at the same time, the tree may be laid on one side quite easily, and with a mass of roots and ball of soil upheaved. We have now to apply the spade, cutting off any roots that may go down, and, throwing in some soil, not rich, tread it or ram it hard. The quantity of soil to put under each tree depends on the depth the trees are in the ground and the surrounding level, but they should have such a quantity as will raise the tree fully 9 inches above the surrounding level for trees 7 feet high, and 1 foot for trees 9 feet in height, calculating the height from 3 inches below the junction of the stock with the scion. The tree is then to be turned the reverse way, lifting with the spades as well as drawing the head, cutting off any roots as on the other side, and adding soil to bring it up to the level of the other side, and the head may then be placed perpendicularly. Soil that is taken out of the trench should be placed so as to form a cone, it being trodden as firmly as possible, barely covering the uppermost roots, and upon it apply a 2-inch thickness of short manure, equally disposed upon the cone, and upon this 3 inches of soil. Tread hard, and we have only to level-up for neatness, the tree appearing on a cone that may have a base of 4 feet and a height in the centre of 9 inches to a foot. It will be necessary to mulch lightly with short littery manure. This keeps out frost, and will be decomposed by spring, or nearly so, and may then be lightly covered with soil for neatness and to prevent its drying. The junction of the stock and scion ought never to be covered with soil or top-dressing. It induces the emission of roots from the scion stem which should not be permitted, but all the available stem of the stock, except the least possible distance necessary for the separation of the scion stem from the soil, should be employed for rooting, and to effect this it should be covered with soil. Of trees lifted in this way not one in all that I have operated on has died; all form at the apex of nearly every spur a plump fruit bud. They will fruit well in the second year after being lifted, and will be good for two or three years or longer, perhaps for life, dependant upon one thing—viz., that they do not make growths of more than 9 inches in length, which may be the results of the trees having the blossom destroyed by frost, for in this case, there being no fruit to take up the sap, it will be expended on new parts; then stopping should be early practised and growth closely restrained. It will be seen by autumn if lifting must be resorted to; if there are fruit buds sufficient for a good crop lifting will not be advisable, for the tree bearing a full crop next year will prevent any continuance of undue vigour. Matters will thereby be righted; but if there are only a few fruit buds or none, lift.

The best time to lift trees is in autumn as soon as the majority of the leaves have fallen, but it may be performed in mild weather up to February. The earlier it is done in autumn after most of the leaves have fallen the better, as the trees have the benefit of roots which are certain to be put forth during the winter. One of the greatest advantages of lifting is the better ripening of the wood which is by it secured; it is a perfect remedy for late and immature growths.

I have one other observation to make with respect to lifting trees that may have been deeply planted. If you happen to have trees of this description to deal with, be cautious in exposing either the stem of the stock or that of the scion—it matters not which; for if you bring the buried stem above the soil it is likely the trees will die, or the branches die back an undesirable distance. Wrap a hayband round such raised stems, and put over it some sacking, so as to protect this part of the stem for a year at least from the influence of the atmosphere, removing the covering by degrees the following autumn.

—G. ABBEY.

LITTLE HEATH MELON.

I, LIKE many others, have grown Little Heath Melon both last year and this, and can speak in its favour. I have an old brick pit with three lights, 4 feet wide and 5 feet long. After being planted with Potatoes, which I lifted the last week of March, I just shook up the bed, which consisted of leaves, and then mixing some short horse dung to start the heat again, I put in a bushel of soil under each light, and no more, consisting of three parts good loam two years old, and one part of cow dung put in a heap two years ago. I then planted the Melons, which were strong, one under each light. The plants were raised from seed sown in a 48-sized pot, and potted singly as soon as the first rough leaf was produced; after planting they grew such healthy dark green foliage, that my gardening friends told me I should have nothing but leaves. Very soon, however, they set plenty of fruit, and fourteen of these in all on the three plants weighed 56 lbs.; my largest was 5½ lbs. weight. They were all cut by the 16th of August, and now I have the pit planted again with May-sown Cauliflower for late autumn use, with the lights off till protection shall be wanted; thus by Christmas the pit will have done good duty, if I have not. My other favourite Melon is Gilbert's Improved Victory of Bath, which I planted in one of Messrs. Boulton's frames, which give me great satisfaction. My employer says we want no other Melon but this, for it is of most delicious flavour, and Little Heath was nearly approaching it, but certainly not equal to it.

As regards affording air to Little Heath Melon, I gave them about the same treatment as the Potatoes, which grew in the pit before them, except that in dull days the lights were pushed off back and front to have a free circulation of air from early in the morning until I shut up, and it always felt to their lot to be last.—C. MEACOCK, *The Gardens, Morville House, Warwick.*

NOTES ON VILLA AND SUBURBAN GARDENING.

As a rule, the ornamental or pleasure portion of the garden of a villa residence receives the greatest share of attention, and the vegetable or fruit garden, though it may be small, is frequently not taken in hand with the same interest and worked with the same animated spirit that somehow seems to grow-up with the former. In my opinion this is not as it should be, for however much pleasure may be derived from the cultivation of flowers, there is such a substantial and profitable return from a well-managed kitchen garden, that the two departments ought to be on a level.

VEGETABLES.—Some, such as the Potato and Onion, will have come to maturity, and should be taken-up and stored away. The former is in most seasons a peculiar crop to deal with; early sorts I presume have been taken up, but the later kinds are beginning to grow, though still unripe, and are likewise affected with the blight, and the question is to know what to do for the best. If the quantity is not large and the tubers are to be used, say this side of Christmas, by all means take them up, but if wanted for use early in spring the tops should be cut off and the tubers left in the ground some time longer. In storing them take care not to lay them thickly in a heap, and let them be put away as dry as possible.

Earth-up such crops as Broccoli and Cabbage, as well as Cauliflowers, and hoe between those just establishing themselves. Some of the late spring sorts may still be planted-out, though to be successful in a high degree they should have been in before. This is the time to plant-out the little Rosette Colewort in quantity; it is one of the best vegetables for winter ever introduced into the garden. It can be planted thickly, say 1 foot each way, and is a very hardy sort, turning-in for use by Christmas and onwards. Clear all ground as crops come off, and dig it up; it may then be planted with different sorts of Kale, such as the tall and dwarf Green Curled, Scotch Cabbaging, and Asparagus Kale. Savoy, too, of the Drumhead kind may still be planted, though I like to plant-out the main crop earlier. Cauliflowers, also, must not be omitted; the most forward for use this autumn should be earthed-up, and those for storing under hand-glasses must be pricked-out in rich soil, while the ground is being prepared for them. It is not well to get them too large towards autumn; therefore, others should be pricked-out from a later sowing. Sow another batch of seed so that a number of the plants may be put-out thickly under walls, and also under glasses, or a frame for the first plantation in spring.

Celery that is to come-in for use next month should be finally earthed-up, but that for winter and spring supply should be allowed to grow freely all this month before much earth is put to it. I find it stands the severe weather much better, owing to the harder state of the outer stalks resulting from these having

a free circulation of air during their growth. All suckers should, however, be pulled off, as well as useless leaves that become broken about; the plants should also be watered freely during this month. Spinach for a winter crop should be sown immediately, and Tomatoes ripening should be encouraged to do so by exposing the fruit to the sun as much as possible, otherwise the process is long, and disease may overtake them.

Another most particular operation now is the planting-out of the different sorts of salading, such as Endive, Lettuces, &c. I presume that of the former there have already been some plantations made for early use, but none of the plants in the seed-bed are strong; they have yet time to grow-out considerably. Good sorts are the Batavian Broad-leaved, Green Curled, Digs-well Prize, and the Moss Curled. The last-named is a more delicate sort, and should therefore be one of the first planted-out. Of Lettuces, sowings should be made frequently, and from each sowing plants should be put-out in every available space of rich ground. There is now no fear of their running to seed, and it is just the time of year to get up a quantity to use in autumn and winter. There is no lack of suitable sorts; there are Hicks' Hardy White Cos, the Black-seeded Bath Cos, &c. The above varieties will do to sow now, and the plants should be put-out thickly under the protection of a wall, or in any sheltered corner to stand the winter. Corn Salad also should be sown. This is a very hardy salad; and Mustard and Cress must not be neglected, as well as Radishes of sorts.

No time must be lost at this season, every preparation being made, and every care taken, to get things well established before winter. Though their appearance will dictate what should be done, the destruction of weeds must be pursued in every quarter, for if any are allowed to shed their seed now the plants will come up in the spring a hundredfold, and prove a source of annoyance and give extra work at a period when other work has to be done.

FRUIT GARDEN.—Among fruit trees there are two things which ought to be well looked after. The first is the ingathering of the fruit as it ripens, and the second the destruction of the insects that eat it. This is the month for them in abundance, and I have already taken means to destroy them by the common methods known to almost everyone; but as to flies and wasps I cannot find anything so suitable for trapping them as the hand-light. For those who may not have tried the plan I will just state what it is. First set a hand-light on a couple of bricks, and place under it a saucer of some sweet enticing liquid, or even a decayed Peach or any other ripe fruit. This hand-light ought to have a small hole in the glass at the top, say $1\frac{1}{2}$ inch square. On the top of this another one is set, but with no hole or outlet of any kind, and the places where they join must be stopped securely up. The wasps enter the bottom light, and after partaking of the liquid fly up and make their way through the hole in the top into the other hand-light, from which they are unable to return. I have caught many hundreds in this way, and saved much fruit which would not otherwise have been preserved. The next thing to look to is to clear the trees of all lateral growth, which at this time of the year is abundant. This admits the sun and light to the buds, and assists in their development for another year. I do not advise the leaves to be picked off the trees, as some would perhaps advocate, for the purpose of ripening the fruit and giving it a colour. I am of opinion that if the wood is properly regulated during the summer, and all superfluous wood not wanted for the formation of the tree kept off, and the rest pinched-back at the proper season, so that it may not once get the upper hand, there is very little, if any, need to interfere further.

All fruit that will hang and is not wanted for present use should be covered with netting. I much prefer the well-known hexagon garden netting to any other; it is very thin, yet strong in texture, and admits all the light; the mesh is so fine that the smallest fly cannot get through. Grape Vines on walls ought also to have their fruit exposed as much as possible to the sun, as it ripens so very slowly in the best of seasons, and the young growth should be stopped-back where it is not wanted.

Strawberry plantations should be made from plants layered this summer, and old beds filled up where vacancies occur. Take care not to plant them deeply. The ground should be well and deeply dug or trenched, and plenty of good manure added. The ground most suitable is that which has previously grown a light crop, as it is not likely to be so much exhausted as if occupied by a deep-rooting vigorous-growing crop, such as Parsnips or a two-season Cabbage bed, which takes too much out of the ground for the Strawberry plant to do well.—THOMAS RECORD.

DOINGS OF THE LAST AND PRESENT WEEKS.

KITCHEN GARDEN.

We have on several occasions alluded to the drought and its effect on the different sorts of vegetables; it is now telling on the *Apple* and *Pear* in a way that we never saw before. On large established trees the leaves are drooping, and in many instances they are falling off with the fruit. In clayey loam

with a deep clay subsoil this would not happen, as the subsoil would retain the moisture. Of course, where the fruit has ripened prematurely it would be folly to allow it to remain on the trees to fall off and be rendered useless. Such fruit will not keep well, and is also deficient in quality. We continue to gather and store Apples and Pears as the fruit becomes ready for gathering. It is also necessary to look over at least twice a-week all fruit that has been gathered, as there are always some specimens showing signs of decay, and which would, if allowed to remain, cause the sound specimens to decay. Looked over wall trees and cut out some superfluous wood, nailing-in shoots where they are required. The slug worm or *slimy grub* has been unusually troublesome this year, especially on Cherry trees, where it seems to be more at home than it is on any other sort of tree. Dusting with dry lime has been recommended to destroy it, but a preferable way is to kill it with the fingers. It is a mere matter of time, and if the grubs are destroyed as soon as observed it will prevent the trees from being disfigured. If this pest is allowed to have its way it will effectually skeletonise the leaves.

Sowed Cauliflower, Lettuce, Early Cabbage, and Onion seeds. We do not find any sorts of Cauliflower succeed better than Early London, Walcheren, and Lenormand's. As soon as the plants have formed the first rough leaf or two they should be pricked-out in an open position and in poor soil. The same treatment is recommended for the Cabbage plants; two good sorts are Early York and Esfield Market. The only variety of Lettuce that has been sown this year is Hicks' Hardy White. It is probably only a good strain of Paris White Cos, but it is as well to know what is really good of the many varieties in cultivation. The only variety of Onion sown is the Deptford.

FRUIT AND FORCING HOUSES.

Pine Apples.—In the fruiting house there are Smooth-leaved Cayenne, Charlotte Rothschild, and Black Jamaica swelling-off. The night temperature is from 65° to 70°; a higher temperature than this, say 5° more, might be maintained if necessary. In our case the fruit is ripening faster than it is required, and in the lower temperature the flavour is quite as good, if not better. Many growers make a practice of watering with manure water. Cow or sheep manure steeped in water and much diluted is the best; but a pinch of guano is less trouble, and is also good. No manure water should be applied after the fruit has grown to three parts the size it is expected to attain. If the plants are kept overwet at the roots, or overdosed with manure water, in all probability some of the best-looking fruit will be black at the core and unrepresentable on the table.

Cucumber House.—Making arrangements for planting out a fresh lot of plants. As we have previously stated, the same plants may be cultivated so as to continue in bearing for at least twelve months; but better crops and superior fruit are produced if the plants are renewed at least every six months. It does not matter much whether the plants are put out in the autumn or spring months. A good time for planting out winter-bearing Cucumber plants is the end of September or early in October; the plants will become established before the dull dark days of Christmas. There is no more useful winter Cucumber than Telegraph, or a good selection of the Sion House type. It is folly to plant very large sorts. Except for exhibition it is not worth while to cultivate them at all; however, there seems to be a growing tendency to revert to such coarse varieties as Marquis of Lorne, and a very similar sort, sent out last year, called Duke of Edinburgh; both of these are large coarse Cucumbers, not even adapted for exhibition, as the fruit does not increase in length without becoming at the same time as thick as a man's arm. A variety named Duke of Edinburgh, and certificated by the Royal Horticultural Society, is quite a different thing, and would be unsurpassed as a winter Cucumber. For summer Cucumbers Tender and True and Blue Gown are models of what an exhibition variety ought to be, but, as with all good Cucumbers, there will be great difficulty in keeping up a true stock.

Melons have not been good this year; but we would like to impress upon all who wish to obtain good Melons that the plants must be kept quite free from red spider, and they must not suffer from the want of water at the roots. Again and again we have met with Melons grown in low lean-to pits with no ventilation in the walls, and almost invariably the plants have been suffering from damp at the collar. The cure for this has been withholding water from the roots, and keeping the surface of the ground quite dry. The check to the plants from damping at the neck, combined with the overdry atmosphere, has rendered them a suitable home for red spider; no after-skill could possibly produce fruit fit to eat from such plants. We have always found Melon plants the least liable to damp-off when trained to a trellis overhead; but in whatever way the plants are trained they ought at no time to suffer from want of water at the roots. A good supply of water about two weeks before the first fruits are likely to ripen, plenty of ventilation, with a night temperature of 65°, and a proportionate rise by day will generally under such circumstances insure good-flavoured fruit. To produce fruit in July, August, and September a span-

roofed house with its end facing south is the best. In the early summer months and late in the year the best form of structure is the half-span. The plants should always be trained to a trellis fixed a foot or 15 inches from the glass roof.

Orchard House.—We are now shaking the Peach and Nectarine trees out of their pots, and repotting all the large trees in the same sized pots in which they had been growing. To do this it is necessary to use an iron prong to disentangle the roots, reducing the ball of roots sufficiently to allow of an inch of the potting material being firmly rammed in down the sides of the pots. Good drainage is also necessary to successful culture. One large piece of potsherd should be placed over the hole in the bottom of the pot, and a few larger pieces round it, finishing off with smaller pieces; over these place some turf with the smaller particles shaken out of it, using only the turfy part. The leaves are sure to flag for a day or two, but dewing with the syringe and keeping the house a little closer than usual will prevent any injury. If the trees have been thoroughly watered a few hours before turning them out of the pots, it is better not to give any water for twenty-four hours after repotting, when a sufficient quantity should be supplied to thoroughly saturate the whole.

Nearly all the Peaches have been gathered; there yet remain Desse Tardive, Exquisite, Lord and Lady Palmerston. The first-named is certainly the very best late Peach we have. It is not quite so good in flavour as Walburton Admirable, but the fruit is larger, it colours better, and it is also a better setter. We have tried several trees of Walburton Admirable in pots, and unless care is taken to impregnate the blossoms the fruit does not set; whereas Desse Tardive never fails to bear a crop, and no artificial impregnation is required. Dymond has disappointed us; the fruit sets very well, but it is only of average flavour, and has not yet grown up to the average size; indeed, it is not so large as Early York. Let us recommend Exquisite as the best of the yellow-fleshed sorts: large, with a fine crimson shade on the sunny side; the flesh is melting and refreshing, and though in flavour it cannot be said to touch Noblesse or Bellegarde, this is as good as some. Lord Palmerston is a good kitchen sort, excellent for cooking purposes, and it makes a delicious pie. It may sometimes be sent in for dessert, but cannot be recommended for that purpose. Lady Palmerston is the last to ripen of the four, and is oftener good than Salway; it ripens ten days or more before that sort. Nectarines are over with Victoria.—J. DOUGLAS.

TRADE CATALOGUES RECEIVED.

Pine Apple Nursery Company, Maidla Vale, Edgware Road, London, W.—*Catalogue of Dutch Bulbs, &c.*

Cranston & Mayo, Hereford.—*Descriptive Catalogue of Dutch, Cape, and other Flowering Bulbs.*

William Barron & Son, 16, Market Street, Nottingham, and Elvaston Nurseries, Borrowash, Derby.—*Select List of Imported Dutch Bulbs, &c.*

Little & Ballantyne, Carlisle, and 36, Mark Lane London, E.C.—*Descriptive Catalogue of Roses, Rhododendrons, &c.—Descriptive and Priced Catalogue of Hyacinths, Tulips, &c.*

Robertson & Galloway, 157, Ingram Street, Glasgow, and The Hermitage, Helensburgh.—*Dutch Root List.*

TO CORRESPONDENTS.

* It is particularly requested that no communication be addressed privately to either of the Editors of this Journal. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only.

Books (*A. T. P.*)—"Small Farms," by the Rev. W. Lea, is published at our office, and may be had free by post for 6d. (*J. Vine*).—Mr. Anderson

edited the new edition of McIntosh's "Practical Gardener." Any bookseller can obtain it for you from Messrs. Blackwood, the publishers.

GARDENER'S WORK ON SUNDAYS.—"A Lancashire Gardener" wishes to know whether gardeners ought to be expected to gather Peas, dig Potatoes, &c., on Sundays. The rule is that all such work ought to be done on the previous Saturday; and the cook or housekeeper, knowing what dishes of vegetables will probably be required, should on that day order accordingly. In places where there is a large extent of glass erections there is always plenty of necessary work to be performed by the man in charge. At the same time it is very undesirable for the cook and gardener to come into collision about this or any other matter in which they have a mutual interest. The gardener should let the cook know in a respectful manner that he does not approve of having vegetables of all sorts gathered on Sundays the same as on any other day in the week, and ask that everything that is possible be ordered on the previous day. If respectful language fails, a man who is possessed of a due measure of self-respect will take a firm stand for what he considers right. Vases are sometimes sent out to be filled with flowers on a Sunday, which shows that in those instances employers have not a due respect for the day of rest. Having thus expressed our opinion, we add as decidedly that a man who would refuse to do any sort of work on Sundays to oblige a considerate employer had far better not apply for the office of head gardener in any establishment. What he may justly object to is, either his employer or the cook persistently requiring work to be done on Sunday which might as easily be done on the Saturday.

BANKSIAN ROSE PRUNING (K. W.).—The Banksian Rose requires very little pruning, but you may regulate the shoots, keeping them from becoming very much crowded, cutting them clean out where too thick, and securing them to the wall. In spring the unripe points of the shoots should be removed, or if they are firm even that is not necessary. The old weak branches may be cut clean out, and replaced by young vigorous shoots trained-in at their full length. The aspect being south there should be flowers next season, but the plants take some time to overcome the disposition to growth. The main thing is to secure the thorough ripening of the wood, and to this our climate is not favourable.

STOPPING SEEDLING PELARGONIUMS (J. P. R.).—We would not stop them but keep them near the glass so as to have them dwarf, and after they have flowered you may cut them down to from 4 to 6 inches of the surface, putting in the cuttings, if you think they are of a kind worth continuing. Keep them rather dry until they have made new shoots an inch long, when they may be turned out of the pots, the ball reduced, and repotted in the same size of pot, shifting into larger pots as those they are in fill with roots—say in November or December, and shift into the flowering-pots in February, stopping the shoots when they have made three or four leaves. Tie out the shoots so as to form a good, well-furnished specimen. Stopping may be practised as required up to March.

ALTERNANTHERAS WINTERING (F. J. C.).—The plants will winter safely in a house from which frost is excluded, they being well established in pots before winter, and with no more water than sufficient to keep them fresh. To encourage growth they may be placed in a frame in March. They winter best with us in a temperature of 50°, keeping them moderately moist so as to continue slowly growing during the winter.

CUCUMBERS SHRIVELLING (Tryng).—It is evident from Melons doing remarkably well that the atmosphere is too dry, or not kept regularly moist for the proper swelling of the fruit. Perhaps the syringings are heavy, and the water hangs on the ends of the fruit. See to the bottom heat, having it 75°, and the border in a proper state as to moisture, not making it very wet, and encourage the surface roots with top-dressings of fresh rich compost, removing the surface soil down to the roots with as little injury to them as possible. Be careful to avoid check by air-giving, maintaining a moist atmosphere, and brisk growing heat of 70° to 75° by day without sun, and 85° or more with sun and air. A minimum of 65° to 70° is suitable at night, though in the morning it may be 5° less.

INDICATIONS OF RIPENESS IN MELONS (Beginner).—There are no "maximum or many points" indicating "when any class of Melons are fit to cut." All Melons show their ripeness by changing colour, usually from green to yellow. The change is sufficiently marked in all to show when a Melon is fit to cut, which is when the ripening colour extends over the greater part of the surface of the fruit. The fruit also when ripening emits an aroma, and after this takes place it should be cut within twenty-four hours. Of some Melons when ripening the foot-talk parts from the stem; and when the aroma commences to be given off, and before the stem is so cracked as to part from the fruit, the latter should be cut. It is not difficult to know when a Melon is fit to cut; all that is wanted is a little experience, and its being fit to cut may be known by its exhibiting a mellowness without signs of decay.

CACTI CUTTINGS (Opuntia).—You must obtain them from friends; we know of no florist who sells them, nor of any work devoted to their culture. "Greenhouses for the Many" contains much about them. You can have it free by post if you enclose ten postage stamps with your address.

PEACH HOUSE ARRANGEMENT (H., Monkstown, Co. Dublin).—You will not need a path in front; one where you show the door at the end will answer. The pruning and tying can be done from beneath the trellis, and from the path at back. We presume you have the front wall arched or on pillars, so as to admit of the roots passing from the inside to the outside border; the trees being planted inside, and the shoots trained to the under side of the trellis, but with the form of trellis you show the shoots will have to be trained to the upper side. We should have the trellis curved as you show it, at bottom, and then flat at 16 inches from the glass. By your plan you will gain a little more light for the trees on the back wall, with the disadvantage of having the trees on the upper side of the trellis. The front wall should be on pillars 11 inches by 9 inches, with openings between of 2 feet 6 inches; and with a stone heading of 10 inches by 9 inches, reaching midway between the pillars, you would not need arches, the stone heading being sufficient to carry the woodwork. This we should have preferred, and we would even yet have the front wall disposed in the way named. We should have three trees in front, and three at the back. On the back wall one Early Beatrice, one Early Alfred, and one Royal George Peach. In front one Noblesse, one Grosse Mignonne, and one Bellegarde; or if you wish for a Nectarine in place of the last-named, have Elruge. Stauwick Elruge, forced with us, is a free-setter, and bears very fine fruit. With the present front wall you will only be able to have two trees in front, Noblesse and Grosse Mignonne Peaches.

WINTER-PRUNING PEAR, PLUM, AND APPLE TREES (St. Bridgid).—The trees not having been summer-pruned, should have the shoots cut back to within half an inch of the wood from which they originate. Any shoots required for extension should be trained in their full length, except the central

shoot, which should be cut back to 13 inches to produce the side shoots and a leader. It is fully, however, not to summer-prune, for the long shoots deprive the spurs of the light and air necessary for ripening the fruit buds. The "Modern Peach Pruner" may be had free by post for 3s. 6d. It does not treat of Apple, Pear, and Plum-pruning, which is different.

BLACK HAMBURGH VINE OUT-DOORS MILDEWED (*G. C.*).—The mildew in your case is due to the excessive drought, the roots being in soil little better, probably, than dust-dry. We should give them a thorough watering with guano liquid, 1 oz. guano to a gallon of water; one good watering as the reason is so far advanced will be sufficient. Dust the leaves, shoots, and fruit in every part with flowers of sulphur; a worsted stocking or muslin bag fixed to a pole is a good mode of application, shaking it so as to distribute the sulphur, which is a well-known remedy. The Sweetwater should be treated in the same way.

GRAPES CRACKING (*J. Ball*).—To prevent cracking, the border where the roots are should be moderately dry at the time of ripening; preserve also a dry atmosphere in the house; and as a further precaution cut a notch on the branch to which the bunch is attached, between the bunch and the main stem; this will check the flow of sap to the berries.

GRAPES SHANKED (*Bristol*).—The cracks are not unusual in the stalks severely shanked. They demonstrate that the Vine roots do not supply sufficient sap. Water abundantly with weak tepid liquid manure. Cut out the shanked berries.

VINES FOR EARLY, MUSCAT, AND LATE VINERY (*W. W. W.*).—For the early house you will need six Vines—three Black Hamburgh, one Buckland Sweetwater, one Foster's White Seedling, and one White Frontignan; for the Muscat house three Vines—two Muscat of Alexandria and one Madresfield Court. In the late house you may have eight Vines—two Muscat of Alexandria, one Madresfield Court, which may be cut by Christmas; or if not to be begun on till then, omit them and have two Mrs. Pince, two Lady Downe's, two Alicante, one Gros Guillaume, and one Trebbiano. If you want more white Grapes substitute two White Lady Downe's for one each of Mrs. Pince and Alicante, and if you have the Muscat of Alexandria and Madresfield Court omit one each of Mrs. Pince, Lady Downe's, and Alicante.

MOVING ROSES, CURRANTS, AND RASPBERRIES (*Hortens*).—You can transplant them at Michaelmas.

BEGONIA CULTURE (*W. S.*).—There is no book devoted to so simple a culture. In our No. 595 are all the directions needed.

SCABBED POTATOES (*S. R. J.*).—The origin of the scab in the Potato is undetermined. It is merely an eruption, confined almost entirely to the skin of the tubers, and, probably, is occasioned by some ingredient in the soil which causes decomposition in the tissue of the Potato's skin. Soils manured with coal ashes have been observed particularly liable to cause the scab in the tubers. We shall be obliged by any of our readers sending us the results of their experience relative to this disease. The scab does not attack all varieties though grown in the same soil and cultivated precisely alike. This year on a heavy soil in Sussex, Kentish Ashleaf, Walnut-leaf, and Lapstone were not scabbed; but Giant King and a large handsome white kidney, name unknown, were scabbed.

WEEPING WILLOWS INJURED BY FROST (*J. M.*).—It is evident you have too tender a variety for your situation; the growth being made late and not ripened, hence they are injured by frost, and die back. It is the Babylonian kind—*Salix babylonica*. We have to record similar experience of this species. The Kulmarock, *Salix caprea pendula*, does remarkably well, having long whipcord-like shoots; the American, *Salix americana pendula*, also grows freely, having larger leaves and stronger shoots. Both succeed with us in an exposed position.

DAHLIA (*W. R. W.*).—Your box and the Dahlia it contained were completely flattened by the post-office punches. Possibly it is a seedling, as you conjecture; but we have seen a variety very like it in colour.

MAIZE (*L. J. W.*).—The specimen enclosed is a case of sporting, in which some female blossoms are combined with those of the male.

CLAY-LIKE STRATUM (*R. S. S.*).—You should have stated your locality, for then geology would have told us the constituents of the stratum. It is evidently aluminous, and if reduced to powder and mixed with a light soil would render this more suitable for Roses.

PLUNGING POTS OF BULBS IN COCOA-NUT FIBRE (*Mann*).—There is no fear of the cocoa fibre heating. But why place them in boxes? Could you not stand the pots on the floor of the cellar, plunging them in the fibre, and covering them with it about 2 inches deep? The bulbs should be potted in moist soil, and the pots be set on a deep bottom, so as to keep the soil moist to insure rooting. The bulbs should be removed to light by the time the crown growth has risen an inch. It answers as well, if not better, to plunge the pots in ashes on the floor of a greenhouse, covering them overhead 2 or 3 inches with cocoa-nut refuse, especially for bulbs required for early forcing. Under a stone shelf or other place free of drip answers well. They will be well rooted in about six weeks.

GREENHOUSE HEATING (*M. C.*).—Your greenhouse is too large to be heated by a stove, but it could be heated satisfactorily by a portable boiler which requires no brickwork, and which you will see advertised in our columns weekly. In order to exclude frost, or afford a temperature of 40 to 45° in severe weather, you will need two rows of 3-inch pipes—i. e., a flow and return along the two sides and one end, or you may have all the pipes in front if you find the pipes at the end likely to interfere with doorways. The boiler may be within the house, care being taken to keep down dust by damping the ashes before removal, and having the smoke pipe perfectly smoketight, and communicating with the external atmosphere, being taken clear of woodwork.

CONSTRUCTING GREENHOUSE (*T. P. F.*).—The proportions of your proposed greenhouse are good, but you do not say what your intentions are respecting the interior. We should have the front wall arched, having openings 2 feet 6 inches wide, and the border inside as well as outside, planting the Vines inside at 15 inches from the front wall, and training them to a trellis 16 inches from the glass. For the plants you will need shelves or a stage, so as to have them near the glass and prevent drawing. Three-inch pipes instead of 4-inch will give you all the heat you need to keep out frost in winter, and will effect a saving in first cost, add to the efficiency of the boiler, and require less fuel from having less water to heat.

BUNSEN'S BURNER (*E. J.*).—Any supplier of gas-fittings could obtain one for you. We do not know where they are manufactured.

GAS-HEATED BOILER (*Regular Subscriber*).—We have never tested such boilers, so cannot say which is best. Write to some of the makers who advertise in our columns.

CATERPILLARS DESTROYING PEAS (*P.*).—Those enclosed are the larvæ of the Daddy longlegs (*Tipula*), and eat the stems near the surface of the soil. We know of no means of getting rid of them except stirring the soil about the roots and picking-out the larvæ.

GRUBS ON PEAR LEAVES (*J. Green*).—You will find engravings and a description of this troublesome insect in No. 638, pages 1-4-5. We cannot advise a better remedy than that which you have adopted—namely, dusting with shaked quicklime; repeating the dose will generally be sufficient to destroy them. See what Mr. Douglas says this week in "Loings."

NAME OF FUNGUS (*Barnard Prior*).—*Agaricus procerus*, eatable. **NAMES OF FRUITES** (*L. J. B.*).—1, *Christie's Pippin*; 2, *Summer Whorle*; 3, *Broughton*; 4, *Carle's Seedling*; 5, not known; 6, *Parry's Pearmain*. (*T. C.*) 1, *Adèle de St. Denis*; 2, *Fondante des Bois*; 3, *Beurre d'Herminette*; 4, *Vicar of Winkfield*; 5, *Lelissine d'Illver*.

NAMES OF PLANTS (*R. Jackson*).—The Fern arising from the Surrey peat sent to you is the common Brake, *Pteris aquilina*.

POULTRY, BEE, AND PIGEON CHRONICLE.

BIRKENHEAD POULTRY SHOW.

The Wirral Agricultural Show was held at Birkenhead on the 2nd and 3rd inst. The pens were Turner's, and were well arranged, and the Show exceedingly well conducted, being the best ever held by the Society. There were twenty-one classes for poultry, most of which were very well filled, and the quality was exceedingly good throughout, with the exception that the old birds were generally very shabby in feather.

In *Dorkings* the winners were very good, but the rest poor; Mr. Walker standing well here, as also in adult *Cochins*, with a grand pen of Buffs. In the following class, first came a grand pullet, though the cockerel in the second-prize pen was by far the best. *Brahmas*, both adult and young, were good. Adult *Spanish* were poor, but the winners good in the young class. In *Game* there was nothing of striking merit. In *Bantams* Mr. Entwistle obtained the first prizes both for old and young birds with *Black Reds*, in the former case with the Sheffield cup cock, which, despite the wild assertions of disappointed exhibitors at that Show, is a bird not easily passed over; the second in old were *Blacks*, and in young *Brown Reds*. Strange to say there were but two classes for *Hamburgs*, a point which the breeders duly appreciated by keeping their birds at home. *Ducks* were grand in both classes, those in young being all *Aylesburys*; and the *Geese* a large class, and perhaps one of the best ever seen at a meeting of this kind.

PIGEONS were the great feature of the Show, demonstrating plainly what can be done by one true fancier in a neighbourhood; the classes throughout were well filled with grand birds. Mr. Fulton showing in every class, was severely handled, as compared with what is generally the case. In *Pouter* cocks a *Black* was first and *Blue* second, and in hens the first and second were *Blue*. *Carriers* were very good in both classes, especially Mr. Fulton's *Black* hen. In *Barbs* a *Yellow* was first and a *Black* second. *Dragoons* were divided into two classes, the first for *Blue* and *Silver*, and the second for Any other colour. In the first-named class the Judge was fairly puzzled, and in the end placed equal firsts and seconds upon both *Silvers* and *Blues*. This was truly a grand class. In the next class the first was a *Grizzle*, the second *Yellow*. In *Anteupers* the winners were *Red Chequers*, capital headed birds, but a little heavier in body and longer in feather than would be appreciated for racing, but by far the best in the class. In *Tumblers* the first was a *Kite*, such as will not be easily forgotten, the head, beak, and eye being extremely grand; the second being an *Almond*. The first in *Owls* was a *White African*, and the second a *Silver English*, but we preferred the *White* one shown by Mr. Fulton to either of the above. In the *Variety* class a *Turbiteen* was first and an *Archangel* second, *Trumpeters* also being brought into this class.

DORKINGS.—1, J. Walker, Rochdale. 2, J. Cowburn, Maesgamed, Corwen. *Chickens*.—1, J. Walker. 2, T. Brockebank, jun., Heswall. *he*, E. W. Southwood, Eakenham; T. Brockebank, jun.

COCHINS.—1, J. Walker. 2, T. Asplin, Church, Accrington. *he*, T. Stretch, Ormskirk; W. H. Crabtree, Leyland, Manchester. *Chickens*.—1, T. Stretch. 2, J. Walker. *he*, C. Sidgwick, Kighley. *he*, W. H. Crabtree; T. Asplin.

BRAHMA POOTRA.—1, T. F. Ansell, Cowley Mount, St. Helens. 2, W. H. Crabtree. *he*, J. Watts, King's Heath, Birmingham. *Chickens*.—1, A. Rigg, Gateacre, Wootton. 2, T. F. Ansell. *he*, W. A. Wright, Southport; J. Walker; G. Maples, jun., Wavertree, Liverpool; A. Rigg. *Light*.—*Chickens*.—1, S. W. Hallam, Whitwick, Leicester. 2, E. Peel, Rock Ferry. *he*, E. Peel; T. A. Dean, Marden, Hereford.

SPANISH.—1, J. Leemings, Broughton, Preston. 2, G. K. Chilcott, Fairlawn, Cutham, Bristol. *he*, H. Wilkinson, Earby, Skipton. *Chickens*.—1, H. Wilkinson. 2, J. Leemings.

GAME.—1, G. W. Brierley, Middleton, Manchester. 2, G. C. Barnett, Birkenhead. *Chickens*.—1, T. P. Lyon, Liverpool. 2, G. C. Barnett. *he*, T. P. Lyon; G. C. Barnett.

BANTAMS.—1, W. F. Entwistle, Bradford. 2, R. H. Ashton, Mottram, Manchester. *he*, W. Johnson, Birkenhead. *he*, W. Brick, Newtown. *Chickens*.—1, W. F. Entwistle. 2, G. C. Barnett. *he*, G. C. Barnett; J. Walker; T. H. Stretch.

HAMBURGS.—1, G. & J. Duckworth, Church. *Chickens*.—1, J. Saunders, Edston, Birkenhead. 2, A. C. Leslie.

ANY OTHERS.—1, J. F. Brierley, Loxton, Newton-on-Willows (Silver Pouter). 2, C. Morris, Gt. Park, Chester (Houdans). *he*, Rev. N. J. Eddle, Newbury (La Fleche); J. J. Malden, Bagginslade (Crève-Cœur). *Chickens*.—1, W. Dring, Faversham (Houdans). 2, Rev. A. G. Brooke, Sbrewsbury (Malays). *he*, S. Elliott, Liskeard (Malays); J. Fearnley.

DUCKS.—*Rouen*.—1, J. Walker. 2, W. Evans, Prescott. *hec*, T. Sear, Aylesbury. *hc*, S. H. Stott, Preston (2); J. Bayley, Birkenhead. *Any other Breed*.—1 and 2, J. Walker.

GEES.—1 and 2, J. Walker. *hc*, Thornham Bros, Hemel Hempstead; H. W. Bannor, New Ferry; H. D. Brandreth, Brookhurst, Bromborough; T. Mills, Seacombe; J. White, Wintley, Netherton, Wakefield; Capt. L. Anyon, Chorley. *c*, S. H. Stott.

TURKEYS.—1, J. Walker. 2, J. Frookwell, Wigan. *hc*, J. Cowburn; Rev. N. J. Kidley; J. Dixon, Liverpool. *c*, W. A. Gray, Thurston.

PIGEONS.

POUTERS.—*Cock*.—1, J. Richmond, Oswaldtwistle. 2, J. Baker, London. *hc*, H. Verdon, Wavertree, Liverpool; K. Fulton, London. *Hen*.—1, J. Baker. 2, E. C. Stretch. *hc*, R. Fulton; J. Baker.

CARRIERS.—*Cock*.—1, R. Fulton. 2, P. R. Spencer, Hereford. *hc*, W. Bell, Southport; R. Fulton; J. Baker. *Hen*.—1 and 2, R. Fulton. *hc*, E. C. Stretch.

BARBS.—*Single Bird*.—1, J. Baker. 2, R. Fulton. *hc*, R. Fulton; H. Yardley, Birmingham.

DRAGONS.—*Blue or Silver.*—*Single Bird*.—1, F. Graham, Birkenhead. *Extra* 1, W. Smith, Walton, Liverpool. 2, W. Gamon; H. Yardley. *hc*, F. Graham (2); E. C. Stretch; W. Smith; W. Gamon (2); W. H. Mitchell; J. Holland, Manchester (2). *Any other Colour.*—*Single Bird*.—1 and 2, F. Graham. *hc*, J. G. Dunn, Ryton, Durham; F. Graham; W. Gamon; J. Baker.

ANTWERPS.—*Single Bird*.—1 and 2, W. Gamon.

TEMPLES.—*Single Bird*.—1, J. Baker. 2, H. Verdon. *hc*, H. Verdon; H. Yardley.

FANTAILS.—*Single Bird*.—1 and 2, J. F. Loversidge, Newark, Notts. *hc*, Q. Blum, Higher Brongton, Manchester.

OWLS.—*Single Bird*.—1, P. H. Jones, Fulham. 2, H. Verdon. *hc*, T. Moore; J. Baker (2).

NUSS.—*Single Bird*.—1, J. Richmond. 2, H. Yardley. *hc*, Rev. A. G. Brook.

TRUMPETS.—*Single Bird*.—1, P. H. Jones. 2, J. Baker. *hc*, P. H. Jones; J. Baker.

ANY OTHER VARIETY.—1, R. Fulton (Turbiten). 2, H. W. Webb, Lower Sydenham (Archangel). *hc*, J. Lederer (Trumpeter); A. A. Vander Meerckx (Black and Light Mottled Trumpeters); H. W. Webb (White Pigmy); J. Baker (Red and Yellow Jacobins).

JUDGES.—Mr. Esquilant, Brixton; Mr. Teebay, Preston.

DRIGHLINGTON POULTRY SHOW.

This took place on the 5th inst., but was a very small affair, there being only a hundred entries. Ten or a dozen years ago this Show was considered quite an event, the schedule being good as compared with others of that time; but we are sorry to say that now the Committee does not include a single fancier, and the consequence is that the farmers beat down the poultry prizes, thinking it too much to give 20s. for the best Game cock, when only that amount is given for the best bull, forgetting that a class of Game cocks will pay the whole in entries, while perhaps only one bull is entered. On this occasion, however, there was a fair show as regards quality if the numbers were not good, Mr. Beldon taking most of the prizes with very good birds. There were no entries for Aylesbury Ducks, but the Rouens were fair; and in Game Bantams Mr. Noble showed an exquisite pen of Black Reds.

Of Pigeons Mr. Thresh showed a nice pair of Black Barbs, and the Antwerps were pretty good as a class. In Jacobins, Yellow were first and Reds second. In the Variety class young Blue Dragons were first, Ice Pigeons second, Nuss and Ice being also noticed.

Rabbits were as good as any section of the Show. The winning Lop-ears were really good, both being Fawn-and-white. The first prize in the Variety class went to Himalayan, and the second to Silver-Grey.

SPANISH.—1, H. Beldon, Goitstock, Bingley. 2, J. Thresh, Bradford.

DORRINGS.—1 and 2, H. Beldon.

COCHIN-CHINA.—1 and 2, H. Beldon.

FLAMBA COOTER.—1, H. Beldon. 2, W. Schofield, Birkenshaw.

GAME.—*Black-breasted or other Red*.—1, H. Beldon. 2, J. Hodgson, Bradford. *Duckwinged*.—1, W. H. Mason, Drighlington. 2, A. Fell, Adwalton.

Any other variety.—1, J. J. Mason, Drighlington.

HAMBURGHS.—*Golden-spangled or Golden-pencilled*.—1 and 2, H. Beldon.

Silver-spangled or Silver-pencilled.—1 and 2, H. Beldon. *Black*.—1 and 2, H. Beldon.

ANY OTHER VARIETY.—1 and 2, H. Beldon.

ANY BREED.—*Cock*.—1, J. Hodgson, Foving. 2, H. Beldon.

BANTAMS.—*Game*.—1, G. Noble, Staincliffe, Batley. 2, H. Butler, Bradford.

Any other variety.—1, C. & J. Hingworth, Heights, Hightown. 2, H. Beldon.

DUCKS.—*Rouen*.—1, J. R. Pollard, Wibsey Bank Foot. 2, B. Parkinson, Dewsbury. *Any other variety*.—1, H. Beldon. 2, D. Stead, Adwalton.

PIGEONS.

CARRIERS.—1, H. Beldon.

POUTERS.—1, H. Beldon. 2, J. H. Sykes, Ruddersfield.

TEMPLES.—*Almond*.—1, H. Beldon. *Any other variety*.—1, H. Beldon. 2, T. Scott.

BARBS.—1, J. Thresh, Bradford. 2, J. H. Sykes.

ANTWERPS.—1, H. Beldon. 2, J. H. Sykes.

FANTAILS.—1 and 2, J. H. Sykes.

JACOBINS.—1 and 2, T. Hoff, Bradford.

TRUMPETERS.—1, H. Beldon. 2, J. H. Sykes.

MAGPIE OR SWALLOW.—1 and 2, H. Beldon.

WILD.—1, S. & W. Sheard, Hightown. 2, H. Beldon.

OWLS.—1, J. Thresh, Bradford. 2, W. Harcastle, Bingley. *c*, H. Beldon.

ANY OTHER VARIETY.—1, G. S. Burton, Leeds. 2, H. Beldon.

RABBITS.—*Spanish.*—*Euck or Doe*.—1 and 2, G. S. Burton, Beeston Hill. *Any other variety*.—1 and 2, G. S. Burton. *Common.*—*Euck or Doe*.—1, G. S. Burton, Leeds. *c*, J. Kendall, Adwalton.

The Judge was Mr. J. Dixon, Clayton, Bradford.

BRISTOL POULTRY SHOW.—We are glad to hear that Mr. Cambridge has received sufficient promise of support to enable him to decide upon holding another show, the date of which will be

found in our list of exhibitions. The responsibility, however, being great, subscriptions will be thankfully received by him.

THE POULTRY-KEEPER.—No. 18.

THE BRUGES, OR NORTHERN GAME FOWL.

This includes nearly all the fighting varieties. Its gait and physiognomy are like the English Game fowls. In strength, shape, and weight it resembles the Malay. It is the largest and strongest European variety, and it is ranked amongst the best. The body, very large, is strongly supported by strong and sinewy legs. The plumage, being rather close, deceives as to its size. The head of the cock is strong; the comb small and generally dubbed (because of the special destination of these cocks); it ought to be neither single nor double, falling on one side, and black while young. At adult age the comb becomes red, but it retains many black spots, which are still more noticeable on the cheeks. The wattles and ears are very large. The expression of the cock is fierce. The neck is long, and its hackle rather short and close. The foot and the toes are of a dark grey, and are of remarkable strength and size. The cock weighs generally 8½ lbs., but sometimes 9½, and even 11 lbs.

Fig. 73.—Feather of Cuckoo Bruges Fowl.

Plumage.—The preferable colour, and which amongst amateurs characterises the best variety, is entirely of spangled silver in the cock as well as in the hen, but the cock's tail is dark. The spangled cock without any other colour is very rare. They generally have the hackle more or less golden, upper side of the wings red, and under the breast brown or blackish, and the tail black.

The hen does not differ from the male, and she has the same general characteristics. Her comb is small and granulated. The ear-lobe and cheeks greyish black till she is adult, and her plumage, when spangled, is slightly wavy to the feathers of the tail.

There are cocks and hens of all colours, passing from yellowish white to pure black, &c. The preferable variety is wholly black. Its plumage is of a deep black, and produces a striking effect with the cheeks and ear-lobes black. Moreover, they produce very fine specimens. Another variety of dark brown, almost black, is that which furnishes the largest cocks and hens. There still remains another variety, the plumage of which is entirely cuckoo. The feathers have seven instead of four bars, as in all the other cuckoo varieties (fig. 73).

WHITBY POULTRY SHOW.

The forty-first annual Show was held at Whitby on the 2nd inst. in a large field in an elevated position; and the wind proving very strong, one of the marquees which had been erected for the luncheon was shattered during a storm of thunder and

rain, and the good things provided were scattered in all directions. The poultry and Pigeon section proved much better than we have before seen at Whitby, showing an appreciation of the management of Mr. Stonehouse, the Secretary, who is a true fancier. The pens, which were perfect models for an outdoor show, were of wood except the fronts, and their floors were covered with silver sand, a provision to which we would draw the attention of all committees who hold shows near the beach. The pens were arranged in single tiers on two sides of the field, and the occupants received a great amount of attention from the visitors.

Dorkings came first, adult birds being good, but much out of feather; the young were a good class, the pullets being better than the cockerels. Adult *Spanish* were good. The first-prize cock was the best we have seen this year. Young birds were also pretty good. In *Cochins* adult Whites were first, and Buffs second, a really grand pair of Buffs in the chicken class receiving the first award in the next class; the rest were only moderate. Adult *Brahmas* were fair, and the young very good. The first-prize Dark cock was a nice bird; the second, which was Light, losing only from want of age. Of *Game* we can say little, the quality and condition not coming up to our expectation. Few of the *Hamburgs* were worthy of note, except the winners; but these were good in all respects, the cup for the best pen in the Show being awarded to an almost perfect pair of Silver-spangled chickens.

Game Bantams were tolerably good. The first and second prizes went to chickens of this year, and all were Black Reds, and in the next for the varieties Blacks were first and second, and a very promising pair of pure Silver Sebrights third. For Any other pure breed first came Silver Polands, second Red Malays, and third Gold Polands; and this was a very good class. In the Selling class the first were good Buff Cochins, second Dorkings, and third Gold-pencilled. The whole were sold by auction.

The next class was for birds of the district only, but it was very poor, although a cup was offered. This was won by a pair of Silver-pencilled, the cockerel having some points, but a bad comb, while the pullet was perfect. A pen of Gold-pencils was very highly commended, the cockerel good in most points, but the pullet worthless; while a fair pen of Dark Dorkings was also noticed.

Ducks were all good classes, and some of the pens very cheap, and quickly bought, while the *Geese* and *Goslings* were very large and good in all points, the winners in young being Whites, while in old birds a grand pair of Toulouse was placed first. Adult *Turkeys* were good, but the young only moderate.

PIGEONS were not very numerous, but the winners in most classes were of good quality. In *Pouters* Blacks were first and Blue second, others also good, being highly commended; but we would advise the division of this and the Carrier classes into sexes. *Carriers* and *Fantails* were good, while *Jacobins* were also a nice class. Of *Tumblers* only one pair of any great value was shown—viz., a pair of Agates, with heads that were perfect. In *Trumpeters* Blacks were first and Mottles second, but the eyes of the latter pair did not match. Very good *Dun Barbs* were placed first, and capital young Blacks second in that class; but the Variety class was a puzzle, and every pen was noticed. First came Silver Owls, second Ice Pigeons, third White Owls, and fourth Red Magpies.

A pair of **RABBITS** of the Himalayan variety were shown as extra stock.

DORKINGS.—1, J. White, Wariaby, Northallerton. 2, W. Morfitt, Goole. *he*, R. Smith, jun., Norton, Malton; A. Jackson, Great Broughton; Lady A. B. Peirse, Bedale. *c*, J. Carr, Whitby. *Chickens*.—1, A. Jackson. 2, R. W. Richardson, Beverley. *vhc*, J. White. *hc*, Lady A. B. Peirse. *c*, J. Watts, King's Heath, Birmingham.

SPANISH.—1, H. Beldon, Goitstock, Bingley. 2, J. Thresh, Bradford. *hc*, Pallister & Hawkins, Topcliffe, Thirsk. *c*, R. Smith, jun.; J. Linskill, Sleights Station. *Chickens*.—1, H. Beldon. 2, J. Thresh. *hc*, Pallister & Hawkins; G. Clemmet, Lythe.

COCHINS.—1, H. Beldon. 2, A. Spencer, Driffield. *Chickens*.—1, D. & J. Ibbotson, Whitby. 2, H. Beldon. 3, J. W. Corner, Egton, Yarm.

BRAHMA POUTERS.—1, H. Beldon. 2, P. C. Bedington, Whitby. *hc*, T. Dobson, Kirbymoorside, *c*, Rev. R. L. Story, Lockington Vicarage, Derby. *Chickens*.—1, H. Beldon. 2, J. Watts. *vhc*, W. J. Frank, Eaglescliffe, Yarm. *hc*, T. P. Carver, Langthorpe, Boroughbridge; Capt. Percival, Whitby. *c*, Capt. Percival; J. Clemmet, Stokesley.

GAME.—*Black-breasted or other Reds*.—1, W. Adams, Ipswich. 2, R. Smith, jun. *hc*, H. M. Julian, Beverley. *c*, T. Beldan, Northallerton; W. Maynard, Northallerton. *Any other variety*.—1 and 2, J. A. & H. H. Staveley, Driffield. *hc*, B. Winwood, Worcester. *c*, G. Holmes, Driffield. *Chickens*.—1, W. Adams. 2, F. H. Wright, Halifax. 3, W. F. Pitt, Middlesbrough-on-Tees. *hc*, W. Douthwaite, Darlington. *c*, W. W. Ward, Whitby; J. Robshaw, Whixley.

HAMBURGERS.—*Golden-spangled*.—1, R. Keenleyside, Aycliffe. 2, H. Beldon. *hc*, G. Garbutt, Sinnington, Pickering. *c*, G. Garbutt; H. Beldon. *Silver-spangled*.—1 and *hc*, H. Beldon. 2, J. G. Dent, Seaton Carew. *Gold or Silver-spangled*.—*Chickens*.—*any other variety*.—1, R. Keenleyside. *hc*, J. Robshaw, *c*, R. Newby, Welburn, York.

HAMBURGERS.—*Golden-pencilled*.—1 and 2, H. Beldon. 3, G. Holmes. *hc*, J. Webster, Whitby. *Silver-pencilled*.—1 and 2, H. Beldon. *hc*, G. Holmes; G. Speely, Whitby. *Gold or Silver-pencilled*.—*Chickens*.—1, H. Beldon. 2, D. Waller & Wightson, Stokesley. *hc*, J. Russell, Whitby; T. H. Readman, Whitby. *c*, J. Russell; J. Webster.

BANTAMS.—*Game*.—1, W. Adams. 2, Lady A. B. Peirse. 3 and *hc*, W. C. Dawson, Whitby. *Any other variety*.—1, R. H. Ashton, Mottisam, 2, H. Beldon. 3, T. P. Carver, Langthorpe. *hc*, J. Mayo, Gloucester; T. Dyson, Halifax; W. F. Pett.

ANY OTHER VARIETY.—1 and 3, H. Beldon. 2, Lady D. Yeoman. *hc*, T. P. Carver; J. Patrick. *c*, T. Goodwill, Pickering.

SELLING CLASS.—1, D. & J. Ibbotson. 2, A. Jackson, Great Broughton. 3, J. Webster. *hc*, T. P. Carver; P. C. Bedington; G. Pounder, Kirbymoorside; W. H. Young, Driffield; J. Carr. *c*, I. Hainsshaw, Earsheaton; W. G. Urwin, Whitby; J. W. Corner.

DISTRICT CLASSES.—*Fowls*.—*Chickens*.—Cap, T. H. Readman. *vhc*, J. Carr. *hc*, J. Webster. *Farmer's Cross*.—*Chickens*.—1, Rev. J. Taylor. 2, J. Russell. *Barrow's Cross*.—*Ducks*.—1, Miss Dale, Whitby.

DUCKS.—*Aylesbury*.—1, T. P. Carver. 2, Mrs. Stonehouse, Darnholme. *hc*, T. Dobson, Kirbymoorside; W. Percy, Great Driffield. *Ducklings*.—1, J. Newton. 2, T. P. Carver. *c*, T. Dobson.

DUCKS.—*Rouen*.—1, J. Newton. 2 and *hc*, G. Garbutt. *hc*, P. C. Bedington; G. Pounder. *c*, Mrs. C. Tarbotton, Cawton, Gilling, York. *Ducklings*.—1, J. Newton. 2, T. P. Carver. *hc*, G. Garbutt. *c*, Miss Jordan, Driffield.

DUCKS.—*Any other variety*.—1, T. P. Carver. 2, W. Binns, Pudsey. *hc*, T. P. Carver; O. A. Young, Driffield.

GESE.—1, Mrs. J. Mitchell, Pickering. 2, J. Story, Yarm. 3, T. M. Derry, Gedy. *hc*, P. C. Bedington, Whitby; O. A. Young, Driffield; G. Pounder, Kirbymoorside, York. *Goslings*.—1, J. Story. 2, O. A. Young. *hc*, T. M. Derry; Mrs. C. Tarbotton, Cawton, Gilling, York. *c*, Mrs. J. Mitchell.

TURKEYS.—1, T. P. Carver, Langthorpe. 2, J. Story. *hc*, G. Pounder; Mrs. J. Mitchell. *Poulties*.—1, J. Story. 2 and *hc*, Mrs. W. Ward, Eskdalegate.

PIGEONS.

POUTERS.—1 and 2, J. E. Crofts, Blyth, Worksop. *hc*, J. P. Fawcett, Whitby; A. Spencer, Driffield.

TUMBLERS.—1, W. Adams, Ipswich. 2, J. E. Crofts. 3, J. Horsley.

CARRIERS.—1, J. E. Crofts. 2, J. Aconley, Pickering. **FANTAILS**.—1, J. P. Fawcett. 2, J. F. Lowersidge, Newark, Notts. *hc*, T. S. Stephenson, Newbegin, Beverley. *c*, J. Welford.

JACOBS.—1, J. E. Crofts. 2, J. Aconley. *c*, S. Denham, Pickering; W. Horsley, Welham, Malton.

TRUMPETERS.—1, R. J. Smith, Yarm. 2, J. E. Crofts. *hc*, J. H. Watkins, Hereford.

BARBS.—1, J. E. Crofts. 2, J. Thresh, Bradford. *vhc*, J. H. Watkins. *c*, J. Aconley.

ANY OTHER VARIETY.—1, W. Binns, Pudsey. 2, J. Thresh. 3, J. G. Dent, Seaton. 4 and 5, J. E. Crofts. *vhc*, S. Denham. *hc*, J. Aconley (2); J. E. Watkins. *c*, J. G. Dent; N. Russell, jun., Northallerton (silver Owls); J. W. Hyde.

EXTRA STOCK.—J. W. Watson, Sleights (Rabbits).

JUDGE.—Mr. E. Hutton, Pudsey.

BATH POULTRY SHOW.

SEPTEMBER 2ND AND 3RD.

(From a Correspondent.)

ONLY one or two slight alterations in the schedule of this Show will be necessary to make it for the future one of the great chicken exhibitions of the year. Adult classes would be better omitted, as, owing to the moulting season, it is impossible to get together classes of old birds at all worthy of such a show. The first prizes and cups were liberal, but a second prize of 10s. is hardly sufficient. Again, why should old birds be charged 5s. entry fee and chickens 4s.? A uniform rate for all the classes would be very much better. The Committee in their programme state the Judges will be gentlemen of acknowledged experience, now we hardly think Mr. Croote comes within this category, as we do not remember that his name has been much before the poultry public either as a judge or successful exhibitor of any variety. We do not wish to be hard on this gentleman, but we cannot help saying that his awards in the Game, Hamburgs, and Silkie were received with very general disfavour. Mr. Hodson judged the large breeds, French, Polish, and Variety Bantams well.

The first-prize pen of adult *Dorkings* contained a very large hen, but too light in colour. The second-prize cock was best, but the hen not nearly his equal. The cup cockerel was Dark, large in frame, and with very good feet and legs: the rest of the class far behind. Taking the whole class, the pullets were certainly the best, the first-prize a very even pair of Dark birds. The third-prize birds had beautiful combs. Mr. Beachey's was a good pen, but very sooty in foot. In Variety *Dorkings* Mr. Cresswell showed two fine young cockerels, but hardly so light in colour as Silver-Greys should be. The finest Silver-Grey pullet was in the second-prize pen, but she was not well matched. Fair white pullets were third. In *Cochins* Buffs were first, the cock with mealy flights but well ahead. Partridge were first and third in cockerels, and a very good Buff second. Pen No. 45 had been grossly trimmed in the locks, and was justly thrown out by the Judge. We were sorry to see this happen to so old an exhibitor as Mr. Tomlinson. The Cochins cup was awarded to a splendid pair of Buff pullets which had previously taken the cup at Sandy. Mr. Crabtree's was also a very good pen. Mr. Woodgate won easily in Whites. Black *Cochins* were decidedly poor. *Brahmas* were marvellous classes both as regards numbers and quality. Mr. Lingwood's Dark cockerel was the admiration of all beholders; he is immense in size, broad, deep, very good in colour and comb, and altogether a model specimen. We think we are justified in saying that no bird hitherto seen has combined such perfection in points with great size; he justly took the champion cup. The second-prize cockerel, though a good deal younger, will make a very fine bird. He is most beautifully and evenly ticked on the breast, a feature we do not at all dislike. Dark pullets were also good. We think the third prize must have been meant for the next pen. In Light *Brahmas* Mrs. Williamson won with a very fine pen; "Young Hero" was second and out of condition. The first-prize cockerel was good but very yellow. Light *Brahma* pullets were thirty-nine pens, almost one of the largest musters ever seen. Among so many good pens it must have been no easy task to pick out

PARGOTS (Grey).—1, Mrs. J. T. Holmes. 2, Mrs. L. Allen, London Road, S.E.
PARROT or PARROQUET.—1, W. Walter. 2, G. Whiting, Bath. *hc*, Mrs. E. G. Hayward, Stonehouse.
FOREIGN BIRDS—*Pair*.—1, Miss E. Matcham, Bath. 2, Mrs. E. Drummond.
JUDGES.—*Poultry* : Rev. G. F. Hodgson and Mr. J. Croote.
Pigeons : Capt. Norman Hill and Mr. Frederick Gresham.
Cage Birds : Mr. W. A. Blakston.

VALE OF TODMORDEN POULTRY SHOW.

This year the entries at the Show held on the 5th inst. were in all sections much larger than at any previous one at the same place, although little alteration had been made in the schedule; but the management is very good, the Secretary and Committee most obliging and attentive, the pens on Turner's principle and well arranged, and the time of exhibition short.

There were six classes for *Game* and one silver cup, which was awarded to a grand Pile chicken, which, however, had some tail feathers broken, but otherwise was one of the best moulded birds seen this year. Black Reds in both classes were only moderately good, but there were some nice Brown Red pullets. Next to the above-named Pile were two Duckwing pullets, which are about the best we have seen for a long time, though a little shy in the show-pen. Dark *Brahmas* were very good, as also the Light birds. Mr. Watts's highly commended pen contained a grand pullet but a very veedly cockerel. *Dorkings* were not so large as some seen of late, but more correct in limb and colour. *Spanish* were very good; three of the pens had a very close run. In Pencilled *Hamburgs* Messrs. Duckworth showed a grand pair, the pencilling of the pullet very perfect. Mr. Beldon won with a capital pair of Silver-pencilled; but the cup for *Hamburgs* was given to a most excellent pair of Silver-spangled, the only fault being that the cockerel's thighs were a little darker than desirable. The Gold-spangled as regards the two winning pens were very good, especially the first-prize pullet. Black *Hamburgs* were really good, and all fine in face, the first-prize pair very neat and *Hamburg*-like. *Cochins* were good, the first-prize Partridge almost equally developed with old birds, and most perfect in shape and colour.

Game Bantams had but two classes, and the entries were very large, single birds being shown. In cockerels Mr. Entwistle won with a perfect Duckwing; the second, a good Pile, was a little low in condition. Perhaps it will not be saying too much if we assert that the first-prize Pile pullet was about the best ever seen in both style and colour; the second, a Brown Red, was also good; and an extra third prize went to a good Pile. In the next class, Black Rose-combed were first, and Silver-laced second.

French fowls were but poor, while in the Variety class the first were Malays, and second Gold Polands, the latter a little pale in colour.

The first-prize *Aylesbury Ducks* were quickly claimed, the quality being such as has never been surpassed, while the *Ronens* were a grand class. *Chilian Pintails* were first in the Variety class, and *Brazilian* second.

In the district competition there were some good pens, while the majority were only of moderate quality; the most noteworthy being the winning *Brahmas*, the *Game* chickens, and the *Ducks*.

PIGEONS.—In *Pouters* Mr. Harvey won with two exquisite pens of Blues. The style and carriage of these birds is really grand, and with such severe work it is a wonder they keep in such form. *Carriers* were, first Black, and second Duns, the latter heavier but not so stylish as the former, but this award did not please the second-prize winner. *Almond Tumblers* were first, a well-broken pair, but second not so well matched. *Tumblers*, any other variety, were, first capital *Kites*, and second *Yellow Mottles*. *Dragoons* were a large good class, all the prizes going to Blackburn, first to a pair of Blues, second to Yellows, and third to Blues. *Turbits* were, first Reds, and second Silvers, but many pens were in deep moult. The *Fantails* were very good, but the wind was so strong that it was with great difficulty the awards were made, as also in *Jacobins*, where the winners were closely contesting Reds. In *Barbs* the first were Duns, the second Blacks. In *Antwerps*, which is a mixed class, the first were very good medium-faced Silver Duns, the second going to Red Chequers, although this prize was placed in the first instance on a pair of Duns of doubtful sex, but a knot of exhibitors, after sitting in committee upon them, decided upon their being two cocks, and these were disqualified, as also another pen shown by the same exhibitor. In *English Owls* many were a little thin and snouty, and some of the best not fit for the show pen through deep moult. The first were good Blues and quickly claimed. In *Nuns* good Blacks were first, and Yellow second. In the Variety class the first were Ice Pigeons, second Black Fairies, and third Blondinette.

RABBITS.—There were seventy-two entries in six classes, and the competition keen in most of these, and several extras were awarded. In *Lop-ears* Mr. Boyle's grand young doe was again to the front, and second was Mr. Irving's good *Tortoiseshell*. The first was 22½ by 4½ inches, and second 21½ by 4½ inches,

losing also in style and texture of ears; the third a Sooty Fawn Buck 20½ by 4½ inches. *Angoras* were very good, and the *Rabbits* well shown. *Himalayans* were a very large class, Mr. Hallas winning first with a young Rabbit of very grand points; the second also young, very good, and several noticed *Rabbits* of rare quality. *Silver-Greys* were capital, first Mr. Ball's grand doe; second a buck rather too light but very even; and third an even Rabbit, good in shape but not up in condition as compared with the others. In the Variety class the first was a Blue Dutch, and second a good *Hare Rabbit*; and in the Selling class the first was Silver Grey, and the second *Angora*.

GAME.—*Black Red.*—*Cockerel*.—1, W. Spencer, Haworth. 2, E. Aykroyd, Feelschill. *hc*, Capt. Mitchell, Stackssteads; W. Ormerod, Todmorden; R. Walker, Gomersal. *Pullet*.—1, R. Walker. 2, J. Fletcher, Stoneclough. *c*, W. Ormerod.

GAME.—*Brown Red.*—*Cockerel*.—1, J. F. Walton, Horncliffe, Rawtenstall. 2, J. Fortune, Keighley. *Pullet*.—1, H. Butler, Bradford. 2, J. Cock, Worcester. *hc* J. F. Walton.

GAME.—*Any other variety.*—*Cockerel*.—Capt. J. F. Walton. 2, J. Fletcher. 3, G. Ambler, Dewsbury. *hc*, J. Greenhough, Harrogate, Acetington; W. Ormerod; E. Aykroyd; W. Clough, Earby, Skipton. *Pullet*.—1 and 2, E. Aykroyd. *hc*, J. F. Walton; F. Winwood, Worcester.

BRAHMAS.—*Dark.*—*Chickens*.—1, J. H. Fields, Birkdale, Southport. 2, J. Watts, King's Heath, Birmingham. *hc*, R. P. Percival, Northenden; J. Cryer, Littleborough. *Light.*—*Chickens*.—1, Mrs. H. P. Foulkes, Montgomery. 2, J. Long, Bromley Common. *hc*, J. Watts.

COCHIN-CHINAS.—*Chickens*.—1 and *hc*, C. Sidgwick, Keighley. 2 and *hc*, W. H. Crabtree.

DORKINGS.—*Chickens*.—1, T. Eiden, Conoulev. 2, J. Walker, Rochdale. *hc*, J. Stott, Healey, Rochdale; S. Brierley, Bading, Rochdale (2).

SPANISH.—*Chickens*.—1, H. Beldon, Goltstock. 2, E. Winwood. *hc* and *c*, H. Wilkinson, Earby.

HAMBURGERS.—*Gold-pencilled.*—*Chickens*.—1, G. & J. Duckworth, Church. 2, H. Beldon. *hc*, J. Long. *Gold-spangled.*—*Chickens*.—1, G. & J. Duckworth. 2, H. Beldon. *hc*, T. May, Wolverhampton. *Silver-pencilled.*—*Chickens*.—1, H. Beldon. 2, J. Long. *Silver-spangled.*—*Chickens*.—Capt. H. Beldon. 2, J. Fielding, Newchurch. *hc*, J. Long. *Black.*—*Chickens*.—1, C. Sidgwick. 2, J. Long. *hc*, J. Patrick, Hackssteads.

BANTAMS.—*Game.*—*Cockerel*.—1 and *hc*, W. F. Entwistle, Westfield, Bradford. 2, E. Walton, Horncliffe, Rawtenstall. *hc*, R. P. Percival, Cockshaw, Hexham; A. Smith, Northwram, Halifax. *c*, G. Evans, Worcester; J. Nelson. *Pullet*.—1, E. Walton. 2, W. F. Entwistle. 3, J. Nelson. *hc*, W. F. Entwistle; G. Evans; F. Matland, Worcester.

BANTAMS.—*Any other variety.*—*Chickens*.—1, H. Beldon. 2, J. Walker. *hc*, R. H. Ashton, Mottram; T. Cropper, Bacup.

FRENCH.—*Chickens*.—1, H. Wilkinson. 2, G. W. Hibbert, Godley, Hyde.

ANY OTHER VARIETY.—*Chickens*.—1, J. F. Walton (Malay). 2, T. Dean, Keighley (Golden Polands).

SELLING CLASS.—1, R. Hutchinson, Littleborough. 2, G. Higgin, Hebden Bridge. *hc*, T. Wakefield, Goltstock; J. Patrick; C. Holt, Rochdale; W. Ormerod; T. Cropper; *c*, W. Ormerod.

DUCKINGS.—*Aylesbury.*—1, R. Hutkinson. 2, C. Holt. *hc*, J. Walker (2). *Rouen.*—1, T. Wakefield. 2, J. Walker. *hc*, T. Wakefield; C. Holt. *Any other variety.*—1, J. Walker. 2, H. B. Smith, Broughton. *hc*, J. Walker; S. Greenwood, Todmorden; H. B. Smith (2).

GEES.—1, J. Walker.

TURKEYS.—1, J. Walker. 2, R. T. Lord.

DISTRICT COMPETITION ONLY.

COCHIN-CHINA.—*Chickens*.—1, J. Dearden, Shawbottom, Hebden Bridge. 2, J. Sutcliffe, Temple, Todmorden. *hc*, T. Lord, Priestwell, Todmorden; W. Mallinson, Hebden Bridge.

BRAHMAS.—*Chickens*.—1, C. Holt. 2, J. Mitchell, Todmorden. 3, W. Hargreaves, Bacup. *hc*, J. Hollivell, Hebden Bridge; J. Sutcliffe; W. Nuttall, Hebden Bridge; J. Mitchell. *c*, J. Crabtree, Eastwood.

BANTAMS.—*Black.*—*Chickens*.—1, W. Dawson, Todmorden. 2, T. Cropper. *hc*, W. Hey, Rochdale. *Any other variety.*—*Chickens*.—1 and 2, B. Cockerill, Hebden Bridge. *hc*, S. Pickles, Mytholmroyd; H. Crabtree, Todmorden; T. Cropper.

HAMBURGERS.—*Chickens*.—1, J. Patrick. 2, H. Stanworth, Worsthorpe. *hc*, J. Chadwick, Littleborough; T. Williams, Hebden Bridge; R. Anthony, Eastwood.

GAME.—*Chickens*.—1 and 2, W. Ormerod. *hc*, W. Dawson; J. Crabtree, Ewood, Mytholmroyd.

DUCKINGS.—1, W. Hey. 2, W. H. Rothwell, Milnorow. 3, J. Trickett, Waterfoot. *hc*, J. Dearden; S. Whitham, Todmorden.

ANY OTHER VARIETY.—*Chickens*.—1, J. Chadwick. 2, J. Jackson, Todmorden. *hc*, R. Whitehead, Worsthorpe.

PIGEONS.

POUTERS.—1 and 2, W. Harvey, Sheffield. *hc*, W. J. Warburst, Staleybridge; J. Richmond, Oswaldtwistle; E. Horner, Harewood.

CARRIERS.—1, W. Sefton, Blackburn. 2, E. Horner. *hc*, W. Sefton; E. Horner.

TUMBLERS.—*Almond.*—1, W. Harvey, Sheffield. 2, E. Horner. *hc*, H. Yardley, Birmingham. *c*, J. Lawton, Staleybridge. *Any other variety.*—1 and *c*, T. & W. Odde, Brierfield. 2, E. Horner. *hc*, W. Lumb, Rochdale. *hc*, J. Lawton; W. Harvey; H. Yardley.

DRAGONS.—1 and 2, W. Sefton. 3, J. Stanley, Blackburn. *hc*, J. Stansfield, Cornholme; W. Sefton. *hc*, B. Cockerill; W. Harvey.

FANTAILS.—1, E. Horner. 2, J. F. Loversidge, Newark. *hc*, W. Lumb. *hc*, J. F. Loversidge; R. White, Manchester; J. Richmond; W. Sefton.

BARBS.—1, W. Harvey. 2, E. Horner. *c*, H. Yardley.

ANTWERPS.—1, C. Sutcliffe. 2, J. Parker, Burnley. 3, C. Hopwood, Rochdale. *hc*, C. Sutcliffe; P. Greenwood. *c*, R. White; P. Horner.

TURBITS.—1, E. Horner. 2, W. & A. Stott, Healey. *hc*, W. Harvey; S. Lawson, Preston (3); H. Yardley.

TRUMPETERS.—1, G. de Lisle, Loughborough. 2, E. Horner.

OWLS.—*English.*—1, C. Sutcliffe. 2, J. Richmond. *hc*, A. Warburton, Haslingden; W. Holt, Cheadle, Todmorden; S. Lawson. *c*, J. E. Kershaw, Hebden Bridge. *Foreign.*—1, E. Horner. 2, A. Warburton.

ROCKS.—*Blue.*—1, E. Horner. 2, B. Rawnsley, Goltstock, Bingley. *hc*, F. Fielder, Todmorden; W. Sutcliffe, Jan., Lower Lathes, Todmorden; J. Crabtree, Ewood (2).

NUNS.—1, E. Horner. 2, J. Richmond. *hc*, G. de Lisle; J. C. Renshaw; E. Horner.

ANY OTHER VARIETY.—1, W. Harvey. 2, W. Sefton. 3, H. Yardley. *hc*, J. Watts; R. White; W. Lumb; J. E. McVitie, Preston; E. Horner.

SELLING CLASS.—1, E. Rawnsley. 2, J. Richmond. *hc*, J. Fielder; W. Lumb; W. Sefton; E. Horner.

RABBITS.

SPANISH.—*Buck or Doe.*—1, J. Boyle, Blackburn. 2, J. Irving, Blackburn. 3, W. Miller & S. Adams, Bradford. *hc*, J. Moore, Keighley. *hc*, J. Chappell, Dewsbury; B. Conderline, Littleborough.

ANGORA.—*Buck or Doe.*—2, Miss A. Walton, Rawtenstall. *hc*, S. Ball, Bradford; T. S. Lacey, Leicester; J. W. Harling, Burnley; S. Bunsley, Healey; G. C. Hutton, Bradford.

HIMALAYAN.—*Buck or Doe.*—1, J. Hallas, Huddersfield. 2, J. Boyle. 3, T. & R.

Mills, Accrington. *phc*, J. Butterworth, Rochdale. *hc*, W. Hey; J. Butterworth; Miss A. Walton.
 SILVER-GRAY—*Buck or Doe*—1, S. Ball. 2, J. Combre, Warrington. 3, R. H. Glaw, Wakefield. *phc*, J. Boyle. *hc*, J. Boyle. Miss A. Walton.
 ANY OTHER VARIETY—*Buck or Doe*—1, J. Irving. 2, J. Hallas. *phc*, H. E. Johnson, Kett-ring. *hc*, J. Boyle; S. Butterworth.
 SELLING CLASS—*Buck or Doe*—1, J. Boyle. 2, G. C. Hutton. *phc*, S. Butterworth. *hc*, J. Chappell; J. W. Harling. *c*, S. Buckley; P. Johnson, Rochdale.

The Judges for Poultry were Messrs. Hutton and Fielding; and for Pigeons and Rabbits, Mr. Hutton.

MIDDLETON POULTRY SHOW.

THE sixteenth annual Show was held at Middleton on the 1st and 2nd inst. The weather was very wet during the first half of the opening day, and this tended to some extent to prevent the influx of visitors, but when the weather cleared-up a great improvement took place in this respect. As compared with its predecessors this Show was a very flat and poor affair, for in poultry and Pigeons we missed the great names of Beldon, Brierley, Fulton, Horner, &c.; and this being the case, with the prizes so good as they are here, we naturally felt a desire to ascertain the causes. These were in the first place the double-number system, which is an insult to both judges and exhibitors, and offers no real advantage; and next, the Show lasting for two days, the birds being exposed for one night in the Show pen with only a little canvas in front in place of a good substantial marquee, and at this time of year such scant protection is insufficient for pampered and high-bred birds; and, lastly, the system of admitting some exhibitors' birds on the morning of the show day, while others are compelled to deliver them the night before. We would advise the Committee to commence a reform, or else this useful and once grand Show will be lost to the fancy.

Game stood first on the list, the first class containing only one bird and the second only two, the awards here being most extraordinary. The first prize went to a Black Red cockerel which had not a single point to recommend it, the second to a perfect Brown Red. In the next class, for cockerel and pullet, a pair of fair Duckwings were first, and Piles second, the prizes being similarly awarded in the cockerel class. Pullets were a fair class, and the cup given to a Brown Red. *Spanish* cockerels, no entries, and in pullets only one. *Dorkings* were good in most classes. The first-prize *Brahma* cockerel and pullet were very good. In pullets, Mr. Watts showed a good pen of Darks. In *Cochins*, cockerel and pullet, Mr. Sidgwick won easily. Mr. Taylor being second, as also in the cockerel class, but in pullets the Rev. C. Spencer took first position. The above remarks refer to the Buff classes. In the next class the first and second were Partridge, and third White, Mr. Taylor winning first with a grand pair of Whites in the pullet class. *Hamburghs* were very poor classes throughout, and yet there were some good pens; but the section was very badly judged, although cockerel and pullet, Golden-pencilled, were an exception, the first and second being grand pens as also in the cockerel class. Of pullets there were only two pens. In Silver-pencilled, cockerel and pullet, the third-prize pen was by far the best; the second-prize cockerel had a lop tail, and the first-prize birds were out of the race in quality. The cockerels, as also the pullets, were properly placed. In the cockerel and pullet Silver-spangled class the winners ought by all means to have changed places, the second being a grand pair of birds. Some really good Black *Hamburghs* were shown in two classes, but the pullets were not up to what we have seen here. In pullets, Mr. Sidgwick showed a handsome pair which should have been first; one of the pullets in the first-prize pen having most decided brown wing ends. *French* fowls were unusually good in both classes, the *Houdans* being especially fine. In the Variety class the first were capital Gold *Polands*, the second were also of that kind, and the third were *Malays*. In *Game Bantams*, cock and hen of any age, the first were Duckwings, second Brown Reds, and third Piles—three of the best pens it has been our lot to see in a prize list. In single cocks the first was a Black Red very good in style but out of feather, second a very good Pile, and third a capital Black Red. In the Variety class the first were Silver Sebrights, second Blacks, and third Gold Sebrights.

Pigeons were a very poor display as a whole, but in some classes we found good pens of birds, notably the Beards shown by Mr. Woodhouse, and some pens of Dragons.

In Rabbits the competition was not strong, 7s. 6d. and 2s. 6d. prizes not being sufficient inducement to make up a good show. In Lops, Mr. Boyle was again to the front with his grand young doe, which, by the way, improves rapidly, the second a Fawn-and-white. In Angoras, the first was a grand doe, the second small. The *Himalayans* proving good, an extra prize was awarded. Silver-Greys were good, the best, a small young Rabbit, lost on account of size only. In the Variety class a Silver-cream doe was first, and Grey-and-white Dutch second.

GAME.—Black-breasted and other Birds.—Cockerel or Pullet.—1, J. F. Walton; H. W. Hoffer, Rawtenstall. Cockerel.—1, Capt. Mitchell, Newchurch. 2, J. F. Walton.

GAME.—Any other variety.—Chickens.—1, J. Fletcher, Stoneclough, Man-

chester. 2, J. F. Walton. 3, E. Aykroyd, Eccleshill. *hc*, D. Harley, Edin-burgh. *c*, M. Jowett, Clayton, Bradford. Cockerel.—1, H. E. Martin, South-thorpe, Fakenham. 2, J. F. Walton. *hc*, T. F. Lyon, Liverpool; E. Aykroyd, *hc*, Rev. E. Bartram, Birkhamstead; T. Bridgman, *c*, T. E. Keil, Wetherby. 3, J. F. Walton. 3, J. Fletcher. 4, W. Higgin, Ulverston; M. Jowett. *hc*, S. Matthew, Stowmarket; D. Harley. *c*, M. Jowett; J. Goodwin, Liverpool; E. Aykroyd.

SPANISH.—Pullets.—1, H. Wilkinson, Earby, Skipton.

DORKINGS.—Chickens.—1, S. Brierley, Edding, Rochdale. 2, J. White, Warlaby, Northallerton. 3, T. Bridgman, Cononley, Leeds. Cockerel.—1, S. Brierley, Pultes.—1, W. W. Rutledge, Storth Eod, Kendal. 2, S. Brierley, *hc*, Rev. E. Bartram, Birkhamstead; T. Bridgman, *c*, T. E. Keil, Wetherby.

BRAMA POOTRA.—Chickens.—1, E. Ryder, Hyde. 2, R. P. Percival, Northenden, Manchester. *hc*, Mrs. E. Wilkinson, Greenheys, Manchester. Cockerel.

—1, W. A. Taylor, Manchester. 2, E. Pritchard, Tettenhall, Wolverhampton.

c, O. E. Cresswell, Early Wood, Bagshot. Pullets.—1, J. Watts, King's Heath, Birmingham. 2, R. P. Percival. *hc*, J. F. Smith, Cherry Mount, Sheffield.

COCHIN-CHINA.—Buff and Cinnamon.—Chickens.—1, C. Sidgwick, Keighley.

2, W. A. Taylor. 3, Rev. C. Spencer, Naunton, Pershore. Cockerel.—1, C. Sidgwick.

2, W. A. Taylor. 3, Rev. C. Spencer. 2, W. A. Taylor. *hc*, J. W. A. Taylor. 2, C. Sidgwick.

COCHIN-CHINA.—Any other variety.—Chickens.—1, C. Sidgwick. 2 and 3, W. A. Taylor. Cockerel.—1, W. A. Taylor. 2, C. Sidgwick. Pullets.—1, W. A. Taylor. 2, C. Sidgwick.

HAMBURGH.—Gold-pencilled.—Chickens.—1, G. & J. Duckworth, Church. 2, W. Speakman, Nantwich. 3, W. Clayton, Keighley. Cockerel.—1, G. & J. Duckworth. 2, W. Driver, Keighley. Pullets.—1, Driver. 2, R. Simpson.

HAMBURGH.—Silver-pencilled.—Chickens.—1, J. Lee, Middleton. 2, J. Long, Bromley Common. 3, J. Smith, Keighley. Cockerel.—1, J. Lee. 2, J. Long. Pullets.—1, J. Long. 2, J. Lee. *hc*, H. Smith; T. Hanson, Keighley.

HAMBURGH.—Gold-spangled.—Chickens.—1, T. May, Wolverhampton. 2, G. and J. Duckworth, Church. Cockerel.—1, T. E. Jones, Wolverhampton. 2, J. H. Rooth, Holmfirth. Pullets.—1, J. Buckley, Tannock, Ashton-under-Lyne.

HAMBURGH.—Silver-spangled.—Chickens.—1, J. Fielding. 2, J. Long. Cockerel.—1, J. Fielding. Pullets.—1, J. Fielding. 2, S. Lanceshire, Tongue Chatterton.

HAMBURGH.—Black.—Chickens.—1, C. Sidgwick. 2, H. Hoyle, Lumb. *hc*, J. Long. Cockerel.—1, C. Sidgwick. 2, H. Hoyle. Pullets.—1, Stott & Booth, Hunley Brook, Bury. 2, C. Sidgwick. *hc*, H. Hoyle.

FRENCH FOWLS.—Chickens.—1, Rev. C. C. Ewbank, Binglewade. 2, G. Berry, Little Henton. 3, R. H. Wood, Uttoxeter. *hc*, Rev. A. J. L. Dobbin, Raddington Vicarage; T. Yates, Unsworth, Bury; W. Dring, Faversham; G. W. H. H. Godley, *hc*, J. J. Madden, Binglewade. Cockerel.—1, R. E. Bury. 2, Rev. C. C. Ewbank, Binglewade. *hc*, G. W. H. H. Godley. Pullets.—1, Rev. C. C. Ewbank. 2, T. Yates, Unsworth, Bury. *hc*, W. Dring.

ANY OTHER VARIETY.—Chickens.—1, T. Dean, Keighley. 2, J. Fearnley, Linton, Newton-le-Willows. 3, J. F. Walton, Horncliffe, Rawtinstall. *hc*, H. Feast, Swansae; W. A. Taylor, Manchester. Cockerel.—2, J. F. Walton. *hc*, J. Fearnley.

GAME BANTAMS.—1, W. F. Entwistle. 2, E. Walton; W. F. Entwistle. *phc*, J. E. Entwistle, Barmham; *hc*, J. E. Entwistle, Southwell. 3, J. Frith, Chatsworth, Bakewell. Cockerel or Cockerel.—1, W. Baskerville. 2, R. Proudie, Kirkcaldy. 3, W. F. Entwistle. *hc*, G. Hall, Kendal; J. Frith (2); W. F. Entwistle; G. Anderton, Accrington.

BANTAMS.—Any other variety.—1, J. W. Lloyd, Kingston. 2, R. H. Ashton, Mottam. 3 and *phc*, M. Leno, Markyate Street, Dunstable. *hc*, W. H. Robin-son, Keighley.

SELLING CLASSES.—1, J. Walker, Rochdale. 2, W. Hey, Rochdale. 3, A. Bamford, Middleton. Cockerel or Cockerel.—1, J. Walker. 2, J. R. Fletcher, Stoneclough. Pullets.—1, C. Bloodworth, Cheltenham. 2, H. Wilkinson, Earby. *hc*, T. Wakefield, Golborne; Mrs. E. Wilkinson, Greenheys, Manches-ter; P. W. Abram, Wigan.

DUCKINGS.—Aylesbury.—1, C. Holt, Rochdale. 2 and 3, J. Walker. *phc*, R. Hutchinson, Littleborough. *houn*—1 and 5, T. Wakefield. 2, J. Walker. *hc*, T. Wakefield; C. Holt. Any other variety.—1 and 3, H. B. Smith, Broughton. 2, M. Leno. *hc*, J. Walker; H. B. Smith.

GOULDINS.—1 and 2, J. Walker. *hc*, J. White, Whiteley, Netherlton.

TURKEYS.—1, J. Walker.

PIGEONS

TEMBLES.—Balds or Beards.—1, W. Woodhouse, Lynn. 2, T. & W. Oddie, Brierfield, Burnley. Any other variety.—1, R. Minnitt, Rochdale. 2, A. & W. H. Silvester, Sheffield.

CARRIER.—1, W. Richardson, Manchester. 2, S. Dronsfield, Werneth Oldham.

PISTERS.—Cock.—1, D. Garside, Broughton. 2, W. J. Warhurst, Staly bridge. *hen*—1, W. Richardson, Manchester. 2, R. White, Manchester.

BARKS.—1, S. Dronsfield. 2, J. Royle, Manchester.

TURBETS.—1, R. White. 2, J. B. Bowdon, Blackburn.

FANTAILS.—1, J. F. Loversidge, Newark. *c*, J. F. Loversidge; R. White; J. B. Bowdon.

OWLS.—1, A. Hunter, Middleton.

SKYS.—1, J. B. Bowdon. 2, J. C. Renshaw.

DRAGONS.—1, S. Dronsfield. 2, H. K. Molyneux, Manchester. *c*, S. Dronsfield; W. Smith, Walton.

BELGIANS.—Long-faced.—1, C. Hopwood, Rochdale. 2, F. Ramsbottom, Middle-ton. Short-faced.—1, J. C. Renshaw. 2, J. P. Rothwell.

ANY OTHER VARIETY.—1, J. B. Bowdon. 2, A. & W. H. Silvester.

SELLING CLASS.—1, R. White. 2, J. Watts, King's Heath, Birmingham. *c*, W. Richardson.

RABBITS

SPANISH.—1, J. Royle, Blackburn. 2 and *hc*, E. Higman, Middleton.

ANGORA.—1, Miss A. Walter, Rawtenstall. 2, J. Boyle.

HIMALAYAN.—1 and Extra 2, W. Hodgkinson, Heywood. 2, C. G. Mason, Rochdale. *hc*, C. G. Mason; Miss A. Walton.

SILVER-GRAY.—1, T. H. Shore, Rochdale. 2, C. G. Mason. *hc*, J. Boyle.

ANY OTHER VARIETY.—1 and 2, J. Boyle.

SELLING CLASS.—1, J. Butterworth, Rochdale. 2, S. Buckley, Healey. *hc*, C. J. Mason.

The Judges were, for *Cochins* and *Brahmas*, Capt. Heaton for other poultry, Mr. Simon Fielding; for *Pigeons*, the above two gentlemen; and for *Rabbits*, Mr. E. E. M. Roysds.

BEE-KEEPER'S CALENDAR FOR SEPTEMBER.

A good foundation is the principal thing in bee-keeping. Fundamental principles well understood are of more importance and value to intelligent readers than volumes of details of management. Last month the selection and preparation of stock hives were considered. Strong stocks cause no anxiety to their owners; they are able to bear the severities of winters; they swarm earlier than weaker stocks, and do far more work. For profit six strong stocks of bees are equal to twelve weak ones. Some eight or ten years ago condemned bees in this locality could be had for driving. If the cottagers obtained the honey, they cared not for the bees. Some years later 2s. 6d. was the price asked for a swarm, and the buyer had to drive them.

Now for miles round Manchester but few swarms of condemned bees can be had at any price. Here, as elsewhere in England, bee management had made no progress for a hundred years. Large hives dropped into Lancashire and North Cheshire. Their owner was condemned for his ignorance of bees and bee-keeping "in this cold climate." Now large hives are in vogue; the lives of bees are precious; bee-keeping is becoming an art and a science. Working men are obtaining from 20 lbs. to 40 lbs. per hive three weeks after swarming. The mists of ignorance are passing off, and apirians are beginning to see and know what can be done.

Those who keep their bees in bar-frame hives should take especial care of the brood combs in the honey hives. The stock hives would be greatly improved and strengthened by the brood of the honey hives. Every apirian who uses bar frames knows how to remove a comb filled with honey or an empty one, and put a brood one in its place. The brood hatched now lives all the winter; the more brood a stock hive has now, the stronger in bees it will be next spring. If a hive has six sheets or combs of brood now, it will be in good condition next spring, so far as population goes. Six combs of brood now indicate five seams of bees at the beginning of March next. I wish the young apirian to make a note of this simple remark, for he will find it of great importance in guiding him in future years at the season of selection.

At the end of August and beginning of September honey-gathering generally ends, and drones are killed off. If the bees of one or more hives do not seem to molest the drones, there is some reason to fear that they have lost their queens. An examination should be made, first by looking for brood in the hives, and secondly, if none can be found, by driving the bees to see if they have queens. Queenless swarms will remain in a hive of combs if they were there when bereft of their queens, but will not settle or remain in an empty hive if driven into it. An experienced man can very often tell from the conduct of the bees whether they are queenless or not. Such knowledge comes by observation, and not from books. Of course queenless hives at this season should either be set aside for honey, or for the receptions of queens and bees from honey hives.

In fair weather bees instinctively seek honey. If it cannot be had from the fields, they try to get it by robbing other hives. In September perhaps more attempts at pillage are made than in any other month. The doors of all hives should be contracted to help the bees to defend their stores.

September is the best month for autumn-feeding. There is considerable risk run in feeding late, for feeding continuously in October or November very often causes the bees to breed. If frost set in before the brood be hatched, it is often destroyed in part, and becomes foul and ruinous to hives. Winter-feeding indicates neglect or ignorance. Hives that have not stored enough should be fed as soon as possible or convenient. About 15 lbs. of honey or stored syrup keeps a strong hive of bees from September till March. Better have 3 lbs. or 4 lbs. more than is required, than an ounce too little. About the half of 15 lbs. will serve the bees of small old fashioned hives during the autumn and winter months. Let food be given according to population. Three swarms eat as much in one hive as they do in three separate ones.

We now come to the honey hives, and by weighing them we can ascertain how much honey they contain before the bees are driven out of them. We have a rule or standard of calculation. After deducting the weight of hives and bees we reckon 5 lbs. of honey for every 7 lbs. weight. A hive may weigh 100 lbs. The hive, board, and bees may weigh 20 lbs., leaving 80 lbs. of combs. According to our standard there would be about 60 lbs. of honey and 20 lbs. of refuse. The refuse from old combs and lean hives is greater than the standard indicates, and in the case of heavy hives of the current year's swarms (with young combs), the yield of honey will be greater than the standard. In the case, too, of hives without brood the refuse will be less and the yield of honey greater. The standard given is accurate enough for practical apirians.—A. PETTIGREW.

(To be continued.)

NADIRING.

I AM glad that your correspondent "B. & W." admits the distinction between the nadir proper of Taylor and Pettigrew, and the "nether" of the former, which he calls the "quasi-nadir." I venture to suggest that it will save much confusion to bee-keepers in their interchanges of thought and experience if they will adopt Taylor's expression "nether," which is, after all, the more correct opposite to "super," for an additional chamber given below instead of above. The term nadir will then resume its original signification of a hive placed under another hive, "in order that it may be treated as a stock hive another year."

I may mention that I have only found the nadir proper answer with strong and early swarms of the current year. I

have adopted it several times with stock hives to prevent their swarming, but always without success.

As for bee houses, they may be necessary for a few favourite wooden hives; but for the rank and file give me Mr. Pettigrew's three posts, which can easily be made low enough for nadir or "nether" to rest upon with safety.—E. H. R.

CRYSTAL PALACE EXHIBITION OF BEES, HIVES, HONEY, &c.

THE following are the awards at this Show, which opened on the 8th inst., and will be continued to-day. We shall give a report of the exhibits next week.

HIVES.

Hive for observation purposes.—Withheld.
Skep or box hive for depriving purposes, for cottagers' use, that can be supplied for 3s., exclusive of floor-board.—Prize, C. N. Abbott.
Moveable comb hive for depriving purposes.—Prize, F. Cheshire.
Hive for use on the storifying principle.—Prize, J. Lee.
Hive for use on the collateral principle.—Withheld.
Most economical (best and cheapest) complete hive on the moveable comb principle, for cottagers' use.—Prize, C. N. Abbott.

BEES.

Most beautiful breed of Lignian bees—i.e., a queen accompanied by her progeny, the beauty of the queen to be of secondary importance.—Prize, C. W. Smith.

HONEY.

Largest and best harvest from one stock of bees, under any system or combination of systems, the same to be declared on exhibition.—Equal, A. Ferguson, Hon. and Rev. H. Bligh, C. N. Abbott.

Exhibition of super honey from one apiary.—1, Rev. C. Raynor. 2 and 3,

Withheld.
Sraw super of honey, net contents above 20 lbs.—1, W. H. Clark. 2, J. Lee.
Sraw super of honey, net contents not under 14 lbs., nor above 20 lbs.—Prize, Mrs. Pagden.

Sraw super of honey, net contents not under 10 lbs., nor above 14 lbs.—Prize, T. Bagshaw.

Wood super of honey (for wood in combination with glass or straw), net contents above 20 lbs.—1, W. H. Clark. 2, J. Anderson. 3, A. Rusbridge.

Wood super of honey (for wood in combination with glass or straw), net contents not under 14 lbs., nor above 20 lbs.—Equal merit, W. Sward; J. Anderson, R. Graham, R. Anderson, D. Anderson, A. McCrone.

Wood super of honey (or wood in combination with glass or straw), net contents not under 10 lbs., nor above 14 lbs.—1, J. Anderson. 2, R. Anderson. 3, Mrs. Pagden.

Glass super of honey, net contents above 20 lbs.—1, G. Fox. 2, T. W. Cowan. 3, S. Thorne.

Glass super of honey, net contents not under 14 lbs., nor above 20 lbs.—1, T. Plunridge. 2, T. Bagshaw. 3, W. Martin.

Glass super of honey, net contents not under 10 lbs., nor above 14 lbs.—1, S. Thorne. 2, D. King.

Glass super of honey, net contents not under 6 lbs., nor above 10 lbs.—1, T. Plunridge. 2, J. Lightton. 3, T. Bagshaw.

Display of honey in comb for table use.—1, J. Anderson. 2, D. Anderson. 3, Withheld.

Exhibition of run honey in glasses of from 5 lbs. to 10 lbs. each, net contents, the produce of one apiary.—1, C. N. Abbott. 2, J. Anderson. 3, W. Laughland.

Exhibition of run beather honey in glasses of from 5 lbs. to 10 lbs. each, net contents.—1, D. Anderson. 2, J. Anderson.

Exhibition of honey, obtained by the use of the honey-extractor, from one colony.—1, C. N. Abbott.

COTTAGERS' CLASSES.

Largest and best exhibition of super honey in comb, gathered by one stock, or united swarms of bees, the property of exhibitor.—1, H. Withall. 2, S. J. Baldwin. Remainder withheld.

Exhibition of honey in comb, produced in one apiary, without the destruction of the bees.—1, A. Ferguson. 2, M. Freeman.

Exhibition of run honey in glass jars, containing from 5 lbs. to 1 lbs. each.—1, W. Martin. 2, W. Secker. 3, J. Stephenson. 4, Withheld.

MISCELLANEOUS.

Best and largest collection of hives, bee furniture, bee gear, and apicalist's necessities, no two articles to be alike.—1, C. N. Abbott. 2, J. Lee.

Drone trap.—1, F. Cheshire.

Bee feeder, the invention or adaptation of the exhibitor.—Prize, J. S. Turner.

Appliance for introducing alien queen bees to stocks.—Prize, J. Anderson.

Bee dress.—Prize, C. W. Smith.

Method of quieting bees during manipulation, with appliances shown.—Prize, F. Cheshire.

Cheapest and best supers for general use in an apiary.—Prize, J. Lee.

Honey extractor.—Prize, Starling & Co.

Machine for embossing wax sheets for guide combs, with at least six sheets manufactured by it.—Prize, G. Neighbour & Sons.

Exhibition of pure bees' wax, the produce of 1874, in cakes of not less than 1 lb. in weight.—1, W. Martin. 2, W. Loughland. 3, J. Waiter.

Any new invention calculated in the opinion of the Judges, to advance the culture of bees.—Extra, F. Cheshire (4).

DOGS.—No. 5.

TERRIERS IN GENERAL.

ALTHOUGH at the Home for Lost Dogs in London there are always, I believe, a greater number of retrievers than of any other variety (why this is the case I can never make out), yet I think that retrievers are not by any means so numerous in England as many other kinds of dogs. If you take your stand at the market-place of any town in England, particularly near the largest butcher's shop, you will find that place and that spot form the meeting ground for the town dogs. At any corner of any street two or three dogs will generally be found surveying each other with, usually, great curiosity, occasionally with great anger, and sometimes with the direct opposite to anger; but still, at the market-place is the grand gathering. Let but a carriage from the country arrive with a dog or two in attend-

ance, very soon numbers of dogs will be around the strangers—the thin, the thick, the young, the old, the light and active, the heavy and wheezy (the last always ill-tempered), the bold, and the timid. Why, the place at once swarms with dogs, especially since the reduction of the tax. Now I will venture to say further, that by far the great majority of these dogs are terriers, either rough or smooth, either well-bred or ill-bred, or of mixed breed, but the terrier blood is predominant. Occasionally an ill-marked Dalmatian is seen; also, if you keep a good look-out, dog-loving reader, you will sometimes see a dog you may think extinct—viz., a turosip. Spaniels there will be, retrievers, pointers, sheepdogs, and even a greyhound or two, but the greater number will be terriers, or terriers in part, as bull terriers. There are many reasons for this. The terrier is a dog of a convenient size—not over-large, so as to require a great deal of food or much space; not so small as to want to be carried or protected in any way. No: he can take care of himself, fight his own battles, find his way about by himself; he will eat anything, and do well on almost anything. A plucky vigorous little dog, his race is a numerous one.

Terriers abound, and will abound—unlike Persian or Angora cats, of which there are many pure specimens kept, and now and then one sees a half breed, and then the race is merged into the common and lost. The long-haired cat does not alter the English cats; he does not leave his mark upon the feline race in this country; he would soon be stamped out but for the care of amateurs. Not so the terrier. "I will live and I will thrive," seems to be the motto of that energetic little dog.

But there is yet another reason for the great abundance of terrier dogs in England. Rats abound, yea, superabound, and the terrier is a dog of utility in this respect—he is a rat-killer. Rats, I said, superabound. In the London warehouse, to the country outhouse, on shipboard, in rural granaries—everywhere is that pestilent, food-destroying, abhorrent little animal the rat. A London warehouse fell down towards the Thames a few years since. What was the result? The river for some yards was at once black with rats. A farmer pulls down his wheat-rick to dress the corn. As the rick is removed layer by layer the vermin retreat lower and lower; then at last out they run, and the farmer who is wise has his own and his neighbours' terriers at hand to catch and kill the pestilent vermin. Some men with a turn for making calculations has estimated the annual cost to this country of rats—what a tax they lay upon us—and the sum is an enormous one. There need be no wonder, then, that terriers are kept extensively, had they no other recommendation than this that they are sworn foes to rats. Then the pluck the little dogs show in facing the vermin! How a fierce bite only makes them keener after their prey; also their thorough enjoyment of the fun—it is their sport, their pastime, their supreme pleasure. All is done, too, from love of the sport, not for love of their bellies, for they do not eat rats. No master of hounds enjoys fox-hunting more than a terrier enjoys rat-hunting. How appreciative of the fun is that little nose of his, sniffing at the rat-holes in a wall! I never see him there without thinking of Buffon's shrewd and true remark, "A dog's nose is his third eye."

A terrier, rough or smooth, wire-haired or fox, black-and-tan or white, Scotch or English, is the general dog of utility because he is a rat-killer, and rats abound everywhere. The terrier is also a good guard and a good follower. This latter is much to a man who likes a canine companion. A dog with too much bull is a stupid dog in following his master, and at the first sharp turn raises his heavy head in the air, and very probably loses his master. Not so the better-nosed terrier; he keeps his head to the ground, and invariably finds the way his master has gone. Never have I known a terrier—and I have kept many—lose himself. He will find his way from a large town (say Bath) back to his country home readily, though it be miles away. Well is he named terrier, for with his nose to earth he finds his way about the earth's surface. He has no fear at entering the earth after fox, or weasel, or rat, or any other vermin. Very large dogs require very large premises, or they are unpleasant to the nose and injurious to health. Very little dogs are troublesome because of their weakness, timidity, and smallness, and require much attention. They must have a loving mistress to see after them; but the terrier needs no park kennel to be stowed away in from people's noses, as any number of large dogs must be; he also needs no petting, though he likes it well enough. Like middle-sized men, terriers are the most useful. Not the big guardsmen or the dainty dapper Light Dragoons are the strength of the English army, but the common line regiments composed of middle-sized men. So of terriers generally.

In future papers I hope to speak of the different varieties. I hope to call up from an unerring memory in fancy matters the terriers of a past age, and to depict the terriers of the present age. The terrier is the Englishman's prime favourite. Witness the fox terriers who at all shows are so numerous as to be themselves a show. He stands midway in size between the large and the small—the dangerous from their strength, and the trouble-causing from their weakness.—WILTSHIRE RECTOR.

OUR LETTER BOX.

HAMBURGH PULLETS' LEGS WEAK (J. A.).—You do not give sufficient information. You should tell us how the birds are lodged and fed. Much depends on that. Weakness is often the result of bad feeding in youth. Sometimes it is caused by unnatural and stimulating food, sometimes by damp and bad flooring to the houses in which they roost. If the birds are in strong condition we advise you to purge them freely with castor oil, say a table-spoonful every other day for a week, and then give bread and ale freely. We can say nothing about the Dorkings for want of information. We shall be happy to give you all in our power if you will enable us to do so.

DARK BRAHMAS WHITE-FEATHERED (J. P.).—If your Dark Brahmas is a larger and better-shaped bird than his opponents, a judge is not justified in withholding a prize from him because he has white feathers on his breast. The original and the best Brahmas we ever had, had white spots on the breast. Any plumage may be washed with soap and water applied with a dandel, but fowls running in the country should not want it. We shall be very glad to see your account.

POULTRY-HOUSE PERCHES (T. C.).—Your perches should be made of a fir tree or other tree, 14 or 18 inches in circumference, sawn in half, and the round part put uppermost with the bark on. They should be within 24 inches of the ground, and should rest on side pieces or supports, but should not be fastened down, as they are easier to clean when they are moveable.

SPANISH COCKEREL'S WHITE FEATHERS (Resurgam).—It is no detriment to the Spanish cockerel to have a white feather in the flight. They are all hatched with it, but they moult black. Pull them out. We have not yet seen a schedule of the Crystal Palace Show.

COTTINGHAM SHOW.—The following is a corrected list of the prizes awarded to cage birds:—*Yellow or Norwich Canary* (twelve entries).—1, T. Neil, Beverley. 2, W. Forth, Fockington. *Belgian or Half-bred Canary* (ten entries).—1, W. Forth. 2, L. Melnecke, Hull. *Any other Variety of Song Bird* (five entries).—1, W. Needler, Hull. 2, L. Melnecke. *Marked Canary* (ten entries).—1, J. Dowds, Beverley. 2, F. Preston, Hesse. *Canary of any Variety* (twelve entries).—1, Taylor & Clarkson.

LINNETS (H. B.).—The Grey and the Redpoll Linnets are distinct species. Brent's "British Song Birds" details their management and that of Canaries. You can have it from our office by post if you enclose twenty postage stamps with your address.

DISPOSING OF SILK (S. E. E.).—Unless reeled so as to suit the requirements of the manufacturer—that is, so as to form threads by reeling off several cocoons together, you will be unable to sell it otherwise than as floss. We cannot say where you can find a market for it.

METEOROLOGICAL OBSERVATIONS, CAMDEN SQUARE, LONDON.

REMARKS.

- 2nd.—Fine all day; very fine and calm at night.
3rd.—Slight shower in the morning; fine afternoon; wet evening and night; occasional thunder.
4th.—Two or three showers, but fine afternoon and evening.
5th.—Pleasant day throughout, morning and evening very fine; wind rather strong and cool.
6th.—Fine early, but rain before 9 A.M.; a cold rainy day, scarce any sun at any time during the day.
7th.—Wet early, dull at 8 P.M., fine in the middle of the day; but wet evening and night.
8th.—Dull showery day, but warmer than during the last few days.

A regular autumnal week, very cloudy and damp.—G. J. SYMONS.

COVENT GARDEN MARKET.—SEPTEMBER 9.

MARKETS rather dull. Supply ample, both English and foreign; outdoor Peaches and Nectarines being very plentiful. All descriptions of Plums are very abundant this season.

From observations taken near London during forty-three years, the average day temperature of the week is 67.3°; and its night temperature 45.3°. The greatest heat was 81°, on the 20th, 1843; and the lowest cold 32°, on the 29th, 1810. The greatest fall of rain was 1.21 inch.

THE CARPET AND TAPESTRY BEDS AT HAMPTON COURT.—No. 1.

F the great public gardens and parks in the neighbourhood of the metropolis, Hampton Court is this year second to none for beauty and good keeping. The grounds are now in fine trim, and the elegant flower beds are extremely gay, exhibiting tasteful variations that cannot fail to please every eye. There are few views of such exceptional beauty as those which can be gained here from many points, especially from the windows of the Palace; and of the many places in the vicinity

of London, Hampton Court is certainly one of the most attractive, and as such has long and justly possessed a great celebrity. Here we have the happy combination of artificial with natural scenery; the position of the grounds affording varied and beautiful prospects, whilst avenues of stately trees stretch far into the distance, and closer at hand softened outlines are shown on a carpet of verdure.

There are many points of attraction in this garden, but one of its principal features this year is the carpet and tapestry beds, of which plans will be given in this and subsequent numbers. All the flower beds are planted with subjects exhibiting striking and varied colours, and are charmingly effective, showing the great skill and

patient industry that have been exercised by Mr. Brown, the new superintendent. Among the combinations of plants not to be found in the plans which I purpose giving are:—

Amaranthus melancholicus ruber, *Koniga variegata*, and *Lobelia speciosa*.

Bright rose *Pelargonium*, *Perilla nankinensis*, crimson *Pelargonium*, and Golden Thyme.

Young *Aucubas* and *Iresine Lindeni*.

No. 793.—VOL XXVII., NEW SERIES.

Scarlet *Tropæolum Lobbianum* mixed with *Iresine acuminata*, edging of *Gnaphalium lanatum*.

Veronica Andersoni variegata, mixed and edged with *Perilla nankinensis*.

Brazilian Beet and *Cineraria maritima compacta*.

Coleus Mrs. Begg, blackish red, with yellow edging; and *Pelargonium Robert Fish*, light yellow leaves and scarlet flowers.

Variegated Mint and *Coleus Batemanni*, blackish purple.

No. 1855.—VOL. LII., OLD SERIES.

Dark salmon Pelargonium Lucius, Perilla nankinensis, and Dactylis glomerata variegata.

Light yellow Roses mixed with scarlet Pelargoniums, yellow and blue Viola cornuta, edged with Viola tricolor Goliath.

Brazilian Beet and Alyssum saxatile variegatum.

Silver-edged Pelargonium Bijou, Amaranthus melancholicus ruber, Golden Tricolor Pelargonium Sophia Dumaesque, Iresine Lindeni, and light bronzed-leaved Pelargonium Criterion.

Dark salmon Pelargonium Hector, Amaranthus melanco-

Woodstock, but to notice one who has made it famous in a horticultural point of view by his connection with it, and into whose company accidental circumstances brought me at a time when other horticultural friends had specially met for an important purpose. I must say that a more hospitable greeting and a mutual interchange of ideas could not possibly have been accorded to anyone, and some three hours or more of a warm summer day could not have been more agreeably and profitably spent than was done by the gentlemen there as-

licus ruber, Pelargonium Bijou, Iresine Lindeni, Pelargonium Robert Fish, and Viola Cornuta Perfection.—N. COLE, *Kensington Gardens*.

MR. FENN AND HIS POTATOES.

THERE are few who have not heard of the interesting old town of Woodstock, the abode of the fair but unfortunate Rosamond, while Sir Walter Scott has thrown an interesting halo over it as being the scene of one of his inimitable novels. The town, a Royal borough, had evidently been a place of importance long before the present busy hives of industry had an existence; it occupies a favourable site, and its neighbourhood must at all times have been noted for its fertility, which still continues. In its present aspect Woodstock presents a strong contrast to the old towns of the east of England, being mostly if not entirely built of stone, which here occurs in great abundance. I am not sure that the present mode of colouring the walls of such buildings a pale yellow is a recent or ancient practice, nor am I certain that it in all cases improves their appearance, but it tends to give that uniformity which is by many thought desirable. Woodstock contrasts well with many other old towns in the width of its streets; not that they compare with Oxford Street or Piccadilly, but they are wider and less crooked than those of towns that have not undergone the changes which Town Councils now and then enforce when opportunity offers. It has also the merit of being a clean town, if cleanliness in the sense here spoken of be a merit, which, by-the-by, a particular friend of mine disputes very much, alleging that dirt and money always go together, and that a town recommended for its cleanliness exhibits less of prosperity and progress than a bustling dirty one. Of course some exception must be made to this rule, and I believe Woodstock to be one of those respectable towns in which business is carried on with steadiness, the manufacture of gloves being one of its most important branches.

My purpose, however, is not to descant on the trade of

sembled, and as far as I was concerned I must regard it as one of my red-letter days. But before we go further I must inform your readers that the subject on which the meeting was convened was Potatoes; not to settle any angry dispute about extraordinarily heavy Grapes, or the merits of a newly-introduced plant, or the *début* of some variety of Golden Geranium with astounding qualifications, but simply to devote a specified time to the examination of a great number of varieties of Potatoes, and in some degree to test their merits. The latter part of the programme was, I believe, further gone into after I was obliged to leave, which I did with great reluctance; but as the reader has not yet been informed who was the host, I must state it was our very worthy contributor Mr. Robert Fenn, whose labours in the cause of the Potato are so widely known, and their results so disinterestedly made public. The reader has only to turn back to the earlier numbers of this Journal to become acquainted with the pains he has taken to propagate new and distinct varieties, and the long years of patient industry which elapsed before he was rewarded with the improved varieties which he has obtained, and these I hope will be followed by others of equal or perhaps greater merit.

To the ordinary cultivator who has his score of acres it may appear a somewhat frivolous occupation for a steady observing person to be looking over rows of Potatoes when in bloom, and selecting a few flowers from which he will remove the anthers and introduce the pollen from another variety to effect fertilisation, marking the flower in some way known only to himself. Occasional visits are afterwards made to these flowers, and especial care is taken, when a fruit is formed and it approaches maturity, that the same mystical notes shall accompany the seed to its resting place, and which, like the G. G. of fine-bred cattle pedigree, denote something to which the progeny of that seed may be traced. This Mr. Fenn did years and years ago, with a large amount of disappointment in some cases where much good was expected, and a proportionate amount of success mingled with it. It is not merely by fertilising the flowers that a good useful variety is insured, and even what is good is not fairly proved to be so for some years

after, but patience has to be further tried, and the insignificant produce of the fruit so obtained often enough disports itself into a great number of varieties, of which the largest and most promising the first season are not always the best afterwards, but a fresh trial has to be made another year, and that trial has very often to be repeated again and again ere anything that can be relied upon can be had. Thus great perseverance must be exercised, and only those who have followed out this course of action are aware of the many disappointments, and how few the number of really good things there are compared with those that are merely commonplace. Mr. Fenn, however, has been successful in raising some Potatoes of sterling merit, and which are regarded as such by the planting-out public, and I hope the number will be much supplemented by the inspection to which his crops were subjected on August 28th, the day I allude to as that of my meeting the party.

After an excellent luncheon, and discussing various home-made wines for which Mr. Fenn is famous, we adjourned to the garden, and there found a large breadth of ground had been planted with seventy or eighty kinds of Potatoes, in rows about 3 feet apart, with sufficient space between each plant to allow of the due development of the kind. I believe that a larger quantity was grown in a field elsewhere, but there was sufficient here to test the merits of each kind; and one taking the fork, the business of turning-up specimens of the crop commenced, one variety after another being thrown to the top, and their merits or demerits commented upon by those present. Certain kinds came in for a fair meal of praise, and after their history and pedigree had been discussed, marks of commendation in the reporters' notes were placed against them, and other kinds proceeded with. Now and then some little vagaries in the growth of certain kinds attracted attention, involving a dispute whether the specimen in question belonged to the round or kidney section, Mr. Fenn's opinion being often regarded as final in such matters. Nevertheless, there were some anomalies in this respect not easily accounted for, as when grafting had been practised years ago, and, as your readers know, Mr. Fenn was amongst the first, if not the very first, to adopt that mode of altering the character and constitution of a Potato. Other remarks equally instructive and interesting were made, not the least being the difficulty there is in obtaining seed of certain good kinds—only one or two fertile flower-heads in a row perhaps, while a less-deserving kind furnishes the means of propagation more abundantly. These observations, made by our worthy entertainer, with many others of a like kind, were sufficient to make many of us blush who had been content to plant only such varieties of Potatoes as were recommended by general opinion. Here was an instance of a great number of new varieties raised for the public good, and that not by trusting to chance for success, but patience, care, and sound judgment were displayed in the selection of suitable parents; and as the collection was interspersed with specimens of well-known kinds, there was every opportunity for making comparisons, which in some instances were in favour of the established varieties, in others in that of the new ones.

I believe Mr. Fenn's object was to elicit opinions as to the merits of a certain number of the best of his varieties, with a view to their being placed under more extensive cultivation, or, perhaps, in the hands of the public, and every opportunity was afforded of inspecting the crops; moreover, I believe a number of kinds were to be tested by being cooked. At lunch, more than one kind of Potato was presented to us in the condition in which a Potato's merits are best understood, and the general opinion was in favour of a kind whose name I unfortunately omitted to note down. A sparkling wine in which the Royal Muscadine, Espiran, and another outdoor Grape formed the body, was very much admired, as was also another wine in which only two of the kinds named were used. The Vines from the produce of which these wines were made grew to the tops of the highest walls of the house, and partly over the roof and up the chimney-shaft, presenting an amount of greenery which would have been still more remarkable had not the surroundings everywhere abounded in it, for it was only to look over the wall of the garden and the beautiful park of Blenheim lay before us. In the garden itself an old Apple tree was well covered with healthy fruit of that very popular variety the Blenheim Orange. This tree was said to be a graft from the original, but there seemed to be a disposition amongst some of those present to question whether it was the same as the Blenheim Orange of the present day, but it was a healthy fine-looking fruit; and a hint from some self-constituted moni-

ter reminded us that Potatoes and not Apples were the subjects under consideration. Down went the fork and a fresh variety of Potatoes was turned up, which was said to possess all the good bearing qualities of Breesee's Prolific with a much better character at table; next a kidney with the capricious tendency of having some of its produce round; then we came to one somewhat in the way of Sutton's Flourball. It unfortunately happened my duties called me away long before the whole of the varieties had been gone through, and, with a reluctant good-bye, I was obliged to turn my back on Woodstock.—J. ROBSON.

CULTIVATION OF EPIPHYLLUM TRUNCATUM.

THIS was in great favour in my early days, and, except the Camellia, I know no plant which is so beautiful from the middle of December to the middle of January; the variety bicolor is the finer of the two. It blooms at a season when flowers are scarce, and is valuable for cut flowers, but a plant of it 4 feet high and 2 to 3 feet through is worth seeing.

This Epiphyllum used to be well grown at Garscube House near Glasgow, and at Woodhall; and there is a place about Paisley where I have heard it is grown well and in quantities. I used to have two plants of the bicolor variety when gardener to the Earl of Wemyss at Gosford, and one of them was between 2 and 3 feet through, and to see it in full bloom was a great treat.

Pereskia aculeata is sometimes used as a stock for it, also Cactus quadrangularis, but I found Cereus speciosissimus suit it best. A good specimen can be formed in a few years by growing one stem of C. speciosissimus in a healthy state, and once it is in a state for grafting put a row of E. truncatum on each side of it, and the grafts will grow at once. A little moss may be put round for a few days until the grafts unite with the stock. It is quite easily grown, but it requires a little more heat than a common greenhouse. I grew it in a plant stove, but when grafted on C. speciosissimus it might possibly stand in the warmest corner of a greenhouse.

Ordinary soil will suit it, and add some stones or charcoal amongst the soil to keep it porous, or the plant may damp-off some morning. A few pieces of charcoal should be laid round the stock. I found a coating of manure spread over the surface do it much good. The roots grew well in it, and the plant had a fine healthy colour.

I seldom or never see this plant worth looking at, and I hope more attention will be paid to it. It only requires to be seen in perfection to make everyone long to have such a beautiful flower.—J. ADDISON.

THINGS OUT OF SEASON.

IT requires no extraordinary amount of skill to produce good vegetables, fruits, and flowers in their natural season. This is generally known to those for whom they are grown, and the things are valued accordingly. For instance, a Rose in June has to be a good one to command the slightest attention, but a Rose in April or August may be a very inferior flower in a florist's point of view, and yet everybody but the most bigoted florist will admire it. Who will give us a list of August-flowering Roses? Any of them can be made to flower in April. Never mind about perfect outline and fulness of flower; let us have pleasing colour and sweet scent first, the other points afterwards if we can get them. The florists have had it too much their own way: in their eagerness for beauty of form they neglect the principal thing non-exhibitors grow a Rose for—its scent. A Rose ought to go by some other name if it is scentless, and "AMATEUR, Aigburth," has done a good thing by putting a mark against those named in his list which give no pleasure to the olfactory nerves. I wish some one would look after the garden Roses—those possessing the qualities of flowering throughout the summer months, good, vigorous, but even growth, distinct and pleasing colours, and, above all, sweet scent. I rather suspect our exhibitors have their Roses in too close proximity to their manure heaps to enable them to judge correctly about the last point I have mentioned. As for perpetual Roses, I only know one worth calling perpetual, and that I am afraid to name. Besides, it is my duty at present to write about vegetables, and I will begin with

Tomatoes. These are perpetual, or at least may be easily made so. No one with a small heated house need be without them any day in the year. Their culture is extremely simple—much more so, for instance, than winter Cucumbers, and

where these are grown Tomatoes can be grown perfectly well with them so long as they are not shaded. The flavour, I am inclined to think, is equally as good in winter as it is in summer. Orangefield Dwarf is still the best variety for forcing and also for general culture. Hathaway's Excelsior is a very handsome variety of good flavour, but it is not so early nor yet so prolific as Orangefield. I know of no particular merit in the large coarse-growing kinds. Seeds sown, or cuttings struck in summer and grown-on in large pots outside as long as the weather permits, will bear abundantly when placed in heat. Give them heat, light, and moisture, and they will bear as a matter of course. Another batch should be sown in heat early in December, to come into bearing in April; and the third, which will supply the plants for fruiting outside in summer, should be sown in the middle of January.

The Globe Artichoke is another delicacy which is easily produced out of its natural season; not, perhaps, in the depth of winter, but certainly in great abundance till the frost cuts them off. All that is necessary to produce enough and to spare throughout the summer and autumn is to put in a few plants every year about the middle of May; these, if liberally treated, will come into bearing by the time the older plantation is over, and will continue to bear till the weather stops them. Young plants are easily obtainable from the old stools at any time; and although for a week or two after planting they may appear almost dead, yet they will bear as much rough treatment at that time as a Cabbage plant; but when once they begin to grow, if large fleshy heads are wanted they must receive no check. The faster they grow the better they will be. Liquid manure helps them wonderfully.

Lastly, I will mention Lettuces. I suppose nobody need be told how to grow these in winter with the aid of glass; but everybody cannot afford glass, and there are ways by which they can be grown tolerably good without. The small Cabbage Lettuces, of which Tom Thumb is a good type, are the best for this purpose. Seed sown at the end of July, and the plants dibbed-in 7 inches apart in a sheltered position where they can be covered with a shutter in severe weather, will produce nice crisp little hearts through an ordinary winter. Another batch, sown about the 20th August, and planted outside unprotected as soon as they can be handled, will succeed them in April, or even March in a mild spring; after which Bath Cos sown at the same time will follow. The details given can of course be only suggestive, each one must find out the exact time for his own locality. My Lettuces for spring use are always sown between 24th and 27th August; the succession to these is sown in a Potato frame at the end of February. Cabbage Lettuces generally turn-in earlier than Cos, therefore it is a good plan to sow both at the same time.—W. TAYLOR.

LILIUM AURATUM.

IN reply to "H. G. S." in THE JOURNAL OF HORTICULTURE of September 3rd, as to the number of *Lilium auratum* flowers grown on one stem, I beg to inform him that in the conservatory of Alexander Brogden, Esq., M.P., of Lightburne House, Ulverston, the head gardener, Mr. John Melrose, showed me some plants the bulbs of which were purchased from Mr. W. Bull, of Chelsea. On one, grown in a 12-inch pot, there are five stems, one of which is very full of bloom, having no less than forty-six well-expanded flowers upon it. The other four stems average sixteen flowers each, or a total of 110 flowers. In another 12-inch pot there are eight stems, and the total of flowers on these is 128. From tip to tip the blooms measure from 10 to 11 inches.

In the same conservatory I noticed a splendid specimen of the *Vallota purpurea*. The plant was raised from seed by Mr. Melrose. It was shown at the recent Ulverston Horticultural Show, and the Judges awarded it a special ticket of merit. It was to them a new variety, and I should feel obliged if you would kindly say if anything similar to it has come under your notice. You will observe that it differs from the old variety, inasmuch as the new one is white-throated, and the petals are rounded, in place of pointed, at the outer extremity.—BETA.

NOTES FROM AYRESHIRE.—Several *Araucarias* were planted here in 1846-7, then about 1 foot high; the tallest is now 33 feet and perfect in symmetry, feathered to the ground; the others not quite so tall, but all healthy. A *Cryptomeria japonica*, planted out just two years ago, then 4½ feet in height, is now 11½ feet in height; it apparently grows summer and

winter. The honey harvest is excellent. We are about a mile from the sea, and sheltered, in the parish of West Kilbride, Ayrshire.—W. D. A.

GLAZING WITHOUT PUTTY.

IN reply to your correspondent, "C. S.," I annex a section (fig. 76) of the sashbar, which differs slightly, though not materially, from the previous one. From c to d is 1 inch, from a to b is 2 inches, giving a depth of 1 inch to the channel. I see no reason why dust should accumulate in it, but if it should, the first shower would wash it away. The channel would be deep enough to prevent any overflow, but its capacity for carrying off rain could be increased, as shown by the dotted

Fig. 76.

lines E, F, B. The glass is kept in position by thin strips of lead or zinc nailed on the side of the sashbar at d, and bent under and over the glass, say two strips to each pane. The first cost of this kind of sashbar will no doubt be a trifle greater than the one now in use, but that will be more than compensated by the saving in time (which in these days of dear labour means money), in fixing or replacing the glass.—S. B.

"S. B.'s" plan (page 190), appears open to the following objections:—If lead clamps are to afford sufficient resistance to the action of wind, if they would at all, as it will lift sheet lead and large slates on a roof, the lead must be of considerable thickness, and then every clamp would act as a lodgment for dirt, and wherever this occurred the water would draw under the edges of the glass and cause drip. If the clamps proved inadequate, the glass being loose on one side and tight on the other, the leverage being great, there would be a tendency to breakage. There being no bedding, as with putty, and as every overlap occasions a vacuum at the sides, independently of inequalities in the glass, there would be nothing to prevent the wet from driving under if the least obstruction. The roof ventilation, too, would be considerably increased. I look upon any channel that could be safely cut out of the sashbar as practically useless or worse, as it would require constant and careful attention to keep it clear. Had putty been more durable there does not appear to be anything yet discovered that so perfectly answers its purpose. However, the subject is well worth ventilation, and we may yet reach the ultima thule.—V.

STRAWBERRIES.

IN reply to "D. F. J. K.," I never weighed Cockscomb, but at a Strawberry feast here some years ago a person took up eight Cockscombs from the dish, and said, "I think these must weigh more than a pound." The largest Cockscomb measured here was 12 inches, measured round the rim. I have grown many 9 and 10 inches, so measured. My man, "Steevie," who is gone to Canada, and is heartily sick of it, measured the Strawberries with the inches marked on the tape, so that there could be no mistake. Ingram's Prince of Wales is an early Strawberry, but there are several others—Cuthill's, for instance—and one or two foreigners. I have never heard of a Strawberry called Lady Carrington. If Vicomtesse Héricart de Thury has its flowers removed with a view to autumnal bearing, the runners must be kept cut off, and the plants well drenched with liquid manure. It is the same as Marquise de la Tour Maubourg, and Duchesse de Trévise. I used to grow it under the last name but one. I hardly think Mr. Taylor of Hardwicke

Grange can have the true sort. His description of Wonderful is exactly what it is not here. It is a very firm Strawberry, as is Oscar, and both are good travellers. By a good culinary Strawberry, I mean it is *firm* when cooked. Oscar, Wonderful, and Cockscumb, are excellent for sinking whole in jellies. Nimrod is not Eleanor, though the latter was sent out to represent the former; just as Hooper's Seedling was sent out to represent Sir Harry. The true Nimrod is more like the Queen or Carolina superba. I sent it to Mr. Rivers, who at once said it was not Eleanor. Mr. May, the famous Queen grower, gave it to me. Eleanor is a noble Strawberry, but very sour. It is the best type of a cone.

It is plain to me that an article is often made to represent one or more articles. For instance, as supplied to me, I can see no difference between Maurice Bernardin, Ferdinand de Lesseps, and Exposition de Brié, though when properly supplied they may be distinct. Mr. George Paul pronounces Maurice Bernardin and F. de Lesseps to be the same. The Black Prince can be early and also late. For late work Galande red Alpine is good. Mine are in bearing now (September 11th). Owing to different circumstances the testimony as regards Roses and Strawberries must needs be somewhat different.

In Mr. Rivers's list of various dessert Strawberries I see "Wonderful (Jeyes), large and good; very prolific."—W. F. RADCLIFFE.

I AM sorry to see that President seems to be passed over by everyone. My own experience of it is most favourable. I have grown it between rows of pyramid Pears and Apples 4 feet apart, without manure, and this year gathered an immense crop of good-sized fruit. Many of the berries were dried up with the heat and drought, otherwise the plants would have been almost exhausted. Mind, I do not consider it first-rate as to flavour, for it is far too acid to be so, but it is a good, useful sort, and can be grown without pampering.

I shall be much obliged if any of your readers will give me the benefit of their experience as to the growing of Dr. Hogg. It occupies the place of honour in my garden, but makes no return for its advantages. Perhaps like Rivers's Eliza, which requires chalk, or British Queen which is partial to clay, he requires some particular soil. The excellence of the fruit makes it worth while to go to some trouble to grow it. I have lately planted a bed of Bradley's Amateur runners, and as the situation is dry hope to succeed with it. Will any of your correspondents who have tried it kindly give their opinion as to the desirability of this sort?

The "impecunious many" read with wonder of bunches of Grapes weighing 19 lbs. and 20 lbs., and feel with the fox that such things are beneath their notice; but the Strawberry is a fruit within the reach of all, and I think a series of letters treating of the best sorts, and the kinds of soil in which they severally thrive, would be interesting and instructive to all.—M.

NOVELTIES IN THE ROYAL GARDENS, KEW.

KNIPHOPIA (*Tritoma*) **MACOWANI** is a new species flowering in the Cape house. It is, perhaps, quite hardy, and will be an acquisition from its dwarf habit, reaching a height of about 16 inches. The leaves and scape are strong, and require no support. It is adapted for pot cultivation; nice plants may be grown in 32-sized pots. The raceme is 4 inches long, and the individual flowers are the same length as those of *K. Uvaria*, but are lighter in colour. (*K. Uvaria* is the *K. aloides* of Mr. Baker's monograph in the "Journal" of the Linnean Society.)

Coccyopselum repens growing in the Stove is a very attractive plant for hanging baskets, chiefly on account of its dark blue berries; they hang for a length of time, and are useful for winter decoration. The stems are trailing in habit, and purple; the entire plant is covered with hairs of the same colour. Though small, the flowers are pretty, being a light and delicate blue. It is very easily cultivated. Light soil is best. Cuttings and seeds grow freely.

Campanula isophyllum var. **alba** is flowering on the Rock work, and is a pretty companion for the species. It was raised from seeds in the Royal Gardens two or three years ago, and has not yet been very widely distributed. It is well adapted for rockwork cultivation, and when doing well flowers profusely. **Linaria triornithophora** is one of the finest of the genus; there is here a variety with flesh-coloured flowers. It is a perennial, but will flower the same year from seeds. **Asteriscus maritimus** is not so well known or as much valued as it should be. It prefers a sunny border, and should be raised

from seed every year; then it makes rapid growth, attains a yard across, with a height of about 1 foot, and during summer is covered with large yellow flowers. **Margyricarpus setosus** is an interesting small-growing undershrub, well adapted for rockwork. It has small pinnate leaves, with linear subulate leaflets, and bears pretty white berries in tolerable profusion. It belongs to the Rosaceae, and is nearly allied to *Acana*. A native of Chili and Peru, growing on arid hills.

Colchicum speciosum, flowering in a border of the Herbaceous ground, is one of the finest of the genus, and is, indeed, "the largest known species." It is also very robust in constitution, and has, perhaps, larger cornea than any other. The opening buds are almost like pink Magdolias. It is a native of the Caucasus.

Among the **Malvaceae**, **Sphaeralcea miniata** forms a neat shrub 2 feet high, and bears flowers of an unusual colour. "The Painted Mallow" of "*Hortus Kewensis*" was introduced into England in 1798 by the Marchioness of Bute, and was extensively grown at one time both as a greenhouse ornament and shrubby plant, being regarded, according to Sweet (writing in 1831), as of great importance to the decoration of shrubberies in the months of October and November, at which time it is profusely clothed with fine vermilion-coloured blossoms. —(Dr. Hooker, "*Bot. Mag.*") It was lost to cultivation for some years, and we are further informed in the "*Botanical Magazine*" that it was re-introduced by Professor Jameson, of Quito. A native of La Plata. It may be grown from either seeds or cuttings.

SPRING-FLOWERING BORDER.

IN answer to "A SUBSCRIBER," Lothian Stocks 3 inches high and recently pricked-out, are too late for spring-flowering—that is, in time for removal for summer bedding plants. Indeed, these Stocks are not adapted for purely spring work; but are, from their lasting character, fine summer-blooming garden flowers. Even strong May or June-sown plants will be a mass of bloom through the June following, and possibly July. "SUBSCRIBER's" plants will not be removeable, after blooming, until the latter month. If he wishes to have a bed of them, let him plant them as soon as his bed is cleared.

In May sow **Victoria** and dwarf **Chrysanthemum Asters** in rich soil in the open garden. When large enough prick-out 5 or 6 inches apart, on 3 inches of manure topped with soil. These, if attended to by watering, will be in fine condition for removal just when the Stocks are on the wane, and will begin to open their blooms at once. A circular bed of Asters, centred with **Victoria**, and edged with dwarfs, either in mixture in concentric circles or radial lines of separate colours, is massive and fine. I planted hundreds of Asters in July, and many in August. They were on the blooming point; not a leaf was lost. They are now splendid, and will be so until frost come. It will thus be seen that for spring the Stocks in question are too late; but here is a substitute. Centre with dwarf stout plants of dark single **Wallflower**, edge with **Iberis**, and margin with **Aubrietia**, as proposed, and there will be a fine spring bed which can be cleared in time for **Geraniums**.

If good plants of **Myosotis**, either *arvensis*, *sylvatica*, *alpestris*, or *disitiflora*, are at hand, or easily procurable (it is too late to sow seed), they make a fine bed, and it may be made finer by planting white **Tulips** (*La Candeur*) a foot apart before putting in the **Forget-me-nots**. That is a very chaste combination. A round bed filled with **Golden Tom Thumb** single **Wallflower** and broadly edged with blue **Nemophila**, or a groundwork of **Nemophila** dotted with the **Wallflower**, is a rich and telling combination. Sow the **Nemophila** at once in drills; thin out the plants, letting each stand singly; and watch and catch the slugs. Not a day must be lost in sowing the **Nemophila**. The first week in September is the best time, but with a mild autumn and open winter they will succeed sown as late as the twentieth day.

Silene pendula, pink, makes a particularly glowing spring bed. It can be edged with the white variety, or with **Golden Feather**. Healthy root-slips of the latter can be found at the base of plants which have done duty in the summer. Plants of **Silenes** should be from seed sown early in August. **Limnantes Douglasii** (seed sown at once), with **Vermilion Brilliant Tulips** dotted-in, form an excellent arrangement. So do **Veronica glauca** and white **Hyacinths**.

In using bulbs and annuals, the plan is to first put in the bulbs thinly, and then, when annuals are large enough and the

weather mild, to plant them all over the bed thickly. Single blue Hepaticas and Snowdrops, Snowdrops and Scillas, red Daisies and Golden Feather, Cliveden Blue Pansies and white Daisies, are all charmingly arranged according to taste. Primroses and Polyanthus are purely spring flowers, and make enjoyable beds; but the laced varieties should not be far distant from the eye. Cheap varieties of *Anemone coronaria*, if planted closely, make beds of surpassing richness.

If bulbs are planted, put them in the moment the beds are cleared, about 3 inches deep, covering with road grit, or if the ground is very wet, with dried sand. The single varieties are the best for massing. Set the best-ripened seed, gather, and sow at once, and in the autumn following thousands of blooming plants are provided. That is the best way to raise in quantity. Crocuses are indispensable for spring gardening, but if used alone must be put in thickly—in fact, bulbs of all kinds are very gay and pleasing, but the effect is spoiled unless they are planted closely; used in conjunction with the other subjects named, a less quantity suffices. Everything named is off the ground in time for summer bedding, and is easily raised or procurable without serious outlay. It is hoped "SUBSCRIBER," and possibly others, may be able to pick out something to aid in making gay their home-surroundings, and out of the few hints and suggestions may select the arrangement which their own taste and circumstances may dictate as the best.—J. WRIGHT.

EARLY AND LATE STRAWBERRIES, AND FOR PRESERVING.

I wish "D. F. J. K." would try *La Constante* for preserving, as, to my knowledge, there is no kind so valuable for that purpose. The fruit is of good size, regular form, rich colour, solid, and as regards flavour unsurpassed, provided it is thoroughly ripe; it will then hang on the plants unaltered for several days, be it whatever weather may occur. The latter quality *Unser Fritz* likewise possesses in the highest degree.

I hope "D. F. J. K." may get *Early Prolific* true to name, as there seems in certain quarters to exist a desire to depreciate that noble variety. *Cockscorn* ought to be large in whatever soil it is cultivated, the first fruit generally of enormous size and of true cockscorn shape, colour bright salmon, with numerous prominent seeds, and pure white flesh.

I quite agree with "D. F. J. K." as regards *Vicomtesse Héricart de Thury*; this is certainly a valuable early kind, the only drawback is that a large proportion of the berries is rather small. "H." is right in calling *Prince of Wales* a late Strawberry; he ought to have added *Cuthill's Prince of Wales*, as there is an early sort of the same name which was raised at Frogmore. The *Late Prince of Wales* is exceedingly acid. Lady Carrington is unknown to me, nor have I ever heard that *Wonderful* was sold under that name, although the latter has had the honour of being sold under five or six different names in England, France, and Germany. Its true name was *Myatt's Prolific*, which was given to it when Mr. Myatt sent it out, but it seems not having then been brought prominently to public notice.

In conclusion, I beg to say to Mr. John Taylor, of Hardwicke Grange, that Mr. Radcliffe certainly ought to receive thanks for recommending *Wonderful*, and if Mr. Taylor is not satisfied with it I must doubt whether he has it genuine. I have grown *Wonderful* more than twenty years in various soils and climates, and never found it to possess a fault besides retaining frequently a greenish tip. It is quite distinct from all other Strawberries, and cannot be better described than done by "D. F. J. K." when he speaks of Lady Carrington.

Wonderful succeeds best in strong soils, as in dry land its enormous crop does not come to perfection when hot dry weather sets in. The greenish tips may be avoided if we would go to the trouble of supporting the fruit by small forked sticks. It was *Wonderful* (Myatt's *Prolific*) Mr. De Jongh raised his grand and famous Strawberry *Souvenir de Kieff* from.—FERDINAND GLOEDE, *Eppendorf, Hamburg*.

DUNDEE HORTICULTURAL SHOW.

The horticulturists of this busy capital of the jute trade effected a first class show on the 3rd, 4th, and 5th inst., and it was attended by seventeen thousand visitors. In the High School grounds in the centre of the town were three large marquees. The chief one, devoted to flowers, was 230 feet in

length by 47 wide; another, occupied with fruit, was 100 feet long by 47 feet wide; and the third, set apart for vegetables, was of equal dimensions. The leading features were the stove and greenhouse plants, and a magnificent collection of plants for table decoration. The local nurserymen, Messrs. Laird & Sinclair and Messrs. John Stewart & Son, took a large number of prizes in all departments. Messrs. J. & R. Thyne, Glasgow, exhibited a large group of rare and valuable plants; Messrs. Robertson & Galloway, Glasgow, appeared to advantage with *Roses* and *Gladioli*; Messrs. Cocker & Sons, Aberdeen, with seedling Pansies; and Mr. John McPherson, Aberdeen, with Dahlias.

Fruits were rich and abundant, the merchant princes excelling in Grapes and Pine Apples. Bailie Menzies, one of the Magistrates, took five prizes in Grapes. Vegetables were remarkable in size and quality. Col. Macdonald, St. Martin's Abbey, Perth, and John Long, Esq., Kinbrae, Newport, Managing Proprietor and Editor of the *Dundee Advertiser*, carried off the first and second prizes for the best basket of vegetables (ten varieties). Balledgarno, a little hamlet in the parish of Gowrie, noted for success at former shows, won no less than twenty-six prizes.

Fern cases, miniature gardens, floral devices, window gardens, table decorations, table, hand, and coat bouquets, were an extensive, interesting, and popular exhibition. Mr. James Ferguson, a working man well known for defeating professionals in flowering *Lilium auratum*, was again first in his class. Alpines, never absent from a Dundee show, were shown in profusion, rare, compact, and healthy. Edward Moir, Esq., a noted amateur in Ferns, took the first prize for the best thiry.

The Society contemplate holding an International Exhibition in 1876.

WESTWARD HO!

It may, perhaps, suggest itself to some of the readers of the *Journal* that "D. Deal," is a very peripatetic being, and that he is continually "on the go." He turns up in all sorts of places—east, west, north, and south; and yet after all it sounds more than it is. The fact is, I learned from a very dear father a lesson in early life—never to let the grass grow under my feet; and being like him endowed with some degree of energy, I am frequently on the move when others are quietly reposing from their labours, and lay out for myself occupations for three or four days which some would take three times as many for, and I never spare myself when I can gain information that can be profitable to myself or others. I remember once, many years ago, in my unmarried days, I was staying with an excellent clergyman, and in the morning (a very wet one) I said to him, "I must be off to —." He remonstrated in vain, and off I started. It was some eight or ten miles, and when I came back in the evening, looking rather moist and damp, there were many sly winks and exclamations, "flouts and gibes;" and when I said the object of my journey had been to see a Rose garden, there was a general exclamation of incredulity. "Oh, yes! a charming Rose I have no doubt you saw this wet day!" for nothing could persuade my friends that anything could have made me take the journey but the charm of some fair face at the end of it; but the plea was a true one nevertheless. No Hero waited for her Leander. It was our liege lady the queen of flowers I went to see in one of her country homes. And so, now, sometimes the duties of my calling lead me away from home, and between whiles I manage to occupy my time by seeing what I can.

And thus it happened, that having to be at Cheltenham in my clerical capacity for Sunday, August 9th, and having undertaken to act as Judge at the Taunton Pease Show on the 13th, I laid myself out to visit Mr. Prince at Oxford, Mr. Cramb at Llangarthol, to stay a day in Bath, and to visit Mr. Kelway at Langport, and concerning each of these visits I have "summat to say." I should have been glad to have also noticed a visit I paid previously to Mr. Richard Smith at Worcester, but this I must postpone, merely for the present saying ditto to what "C. P. P." has said. My first visit was to

PRINCE'S NURSERY AT LONGWORTH.

I had been long desirous of seeing *in situ* the seedling Brier *Roses* which Mr. Prince has so made his own, and from which he has exhibited such splendid blooms. As in everything, there are those who look on this with favour, and others with disfavour. The latter put forward that it is nothing new, and that it is not a superior mode of culture. Now I do not think it is any disparagement to the plan to say it has been practised by the French for years. In all such matters the main issue is, "Does it answer?" and it was in order to see for myself I made this *détour*. My visit was a hurried one, owing to the

awkwardness of the trains and the fact that I had to be in Cheltenham the same evening. When I arrived at Oxford Mr. Prince told me his nursery was ten miles away, but that if I drove there he could then take me on five miles further, so as to meet the Cheltenham train at Wantage Road. The day happily was fine, and so we started off. On this drive, of course, we had much opportunity for talking, and naturally the seedling Briar was our chief subject. When we arrived at the nursery our time was so short that I had not a fair opportunity of doing justice to it; but I saw enough to convince me that the seedling Briar is a decided success. I saw long rows of it: rows of grafted standards on the same stock, rows of Roses on Manetti and on the hedge Briar, and I can safely aver that those on the seedling Briar were far ahead of all the others. Especially was this the case with Teas; these were simply magnificent.

It has been, I know, said that Mr. Prince's must be a fine Rose soil to produce such blooms as he has exhibited, but this is a mistake; it is by no means such—no way to be compared to the rich unctuous loam of the Hertfordshire Rose grounds—but is of a rich and friable character, much the same sort of soil as I have had to deal with in my own garden, so that I do not think that any of the success which has attended Mr. Prince's efforts is to be attributed to the soil. The situation is good, clear and open; in fact, the nursery was three years ago a part of a Wheat field; but I cannot sufficiently express my admiration of the vigour and beauty of the plants. It would be tedious to enumerate the sorts which struck me as fine, for all were so, and we know what Mr. Prince can do as an exhibitor: it will be as well, then, to say why I think the seedling Briar more advantageous than the Manetti.

1. It seems to me to give a much more enduring character to the Rose. Mr. Prince states that it is earlier than the Manetti, but, at any rate, we know that for late blooms the Manetti cannot approach it, and there is a substance in the petals which comes from the source. I have seen, no matter where, a box of blooms which had been cut the day before the show from this stock, exhibited against others from the Manetti more recently cut, and at three o'clock in the afternoon, when all the others were "fading away," those on the seedling Briar were still fresh.

2. It seems to suit some Roses of delicate habit better than the Manetti. I know people say, "Don't keep Roses of delicate habit;" but there are some, such as François Lacharme and Clémence Raoux, that one would be glad to have, but the Manetti seems too strong for them and overpowers them. The seedling Briar imparts a vigour to them without destroying the Rose, and all kinds seem to thrive. Who can easily forget the wondrous beauty of the blooms of Clémence Raoux exhibited by Mr. Prince at the Autumn Show of the Metropolitan Floral Society two years ago at the Crystal Palace?

3. It is not so liable to suckers as the Manetti, and if suckers do appear they are more easily recognised. I saw positively no suckers in Mr. Prince's nursery, and in the plants that I had from him I have never seen the trace of one, while perpetually they are appearing on the Manetti stock. Doubtless an experienced grower will soon detect the sucker, but everyone is not an experienced grower, and I have gone into the gardens of those who really loved Roses, and have seen the Manetti rampantly overpowering everything, while the owner was wondering why the Rose did not bloom.

4. It seems, equally with the Manetti, to be suited for all soils, but care must be taken in planting not to plant deeply. With the Manetti this is desirable, but the seedling Briar seems to require a different treatment.

I may add that while, perhaps, I cannot go quite with Mr. Prince in all he says and thinks about this stock, I feel he is on the right track, and I think there may be truth in what he says:—"I feel I am only a beginner, and that year by year I learn something new respecting the treatment of this stock and its wonderful adaptability to all soils." He is conducting many experiments with it, and I hope we may yet hear more from him on the subject.—D., Deal.

MR. SHAW'S GARDENS, ST. LOUIS, A.U.S.—At the residence of Mr. Shaw, wherein all are welcome, is kept the record of all visitors, many of them famous. Just beyond is the now justly popular Tower Grove Park of seventy acres, a gift from Mr. Shaw to the city, already beautifully planted and kept. On returning from his house we pass the splendid octagonal mausoleum, designed for his final resting place, built of heavy

stone, with eight arches, hung over with trees which cast a deep shade. We trust it will be long ere it open to receive him. Close by is another tombstone, raised as a tribute of respect to a gardener esteemed for his devotion to horticulture, bearing this inscription—

TO THE MEMORY OF
THOMAS NUTTALL,
Born in England, 1786; died September 1st, 1869.
Honour to him, the zealous and successful naturalist, the father of Western American botany, the worthy companion of Bart. n. Michaux, Hooker, Torrey and Gray.
—(American Horticulturist.)

AMERICAN POTATOES.

It may interest some of your readers to know what we have done here with the new American Potatoes introduced last year. 1 lb. of Vermont Beauty produced 120 lbs., some of the tubers weighing 2½ lbs. each. 1 lb. of Early Gem produced 62 lbs. 1 lb. Ampton's Surprise produced 52 lbs.; but in this case half the sets were destroyed by slugs.

The ground in which these Potatoes were grown was not specially prepared, only the ordinary quantity of manure being used.—FRED. WALTON, St. Cutbert's, Albrighton, near Wolverhampton.

FLORAL DECORATIONS IN NEW YORK.

The profuseness with which flowers are used in New York at bridal or funeral occasions is fairly a subject of extraordinary comment. We have personally known flowers to the amount of six thousand dollars' worth brought to a church to decorate it on the occasion of the funeral of one of the most prominent citizens of this city. *Harper's Bazaar* refers to this subject, and speaks of their use on social occasions.

The floral decorations are a charming feature of evening entertainments this winter, and are without expensive, two thousand dollars being sometimes the florist's bill for the elaborate decorations of a single reception. Different devices are arranged for each room, and for almost every part of each room. Corners are decorated with potted plants, and with cut plants heaped in pyramids; Smilax looped with Rose buds festoons the cornices; draperies of Roses and Smilax are arranged between windows, mantels are divided in three beds of flowers, with Violets in the centre, Daphnes and Roses on each end, and a groundwork of Lycopodium and Ferns. In the wide doors between drawing-rooms is a canopy of flowers shaped like a parasol, and supporting nine balls made of different kinds of flowers, Violets, Roses, &c. The walls of main parlours are transformed into beds of flowers, where wire frames support great fields of Heliotrope, Roses, Camellias, Tuberoses, and Carnations, edged with Ferns, Smilax, and the scarlet leaves of the Poinsettia. On other walls are flower cornucopias 3 feet in diameter, filled with the loveliest cut flowers. To make the hall look different from the rooms, Ivy is draped above the doors and staircases, and the landings have baskets of Ferns and hanging Vines. Great banks of flowers are heaped in the dressing-rooms, and picture frames are studded with Daphnes, Violets, and Roses, and draped with Smilax, while choice cut flowers fill antique jars and vases. Instead of the marriage-bell of flowers formerly seen at wedding receptions, the bride and groom now stand under an arbour or bower of Roses arranged before a long mirror. High epergnes of cut flowers are used on refreshment-tables where the guests stand; at dinners, where the company are seated, there are lower epergnes that do not obstruct the view. Troughs of glass in figures, letters, and monograms, and straw baskets representing sheaves of Oats or Wheat, also hold the flowers. At small dinners each gentleman guest finds a boutonniere at his plate, and each lady a larger nosegay, called by the florist a belt bouquet, or else a napkin bouquet. The latter cost from one dollar to two dollars each, and the former fifty cents. The long-stemmed flowers that are now loosely put together for hand bouquets are first pierced through the calyx by a fine wire, which is then twisted around its stem to support it, the florists say. Remonstrate against this torture of so sweet a flower, and you are assured that experiment proves that the pierced Rose will not fade sooner than its lovely companion that is left free beside it. The bouquet is chosen with reference to the flowers that trim the dress.—(American Horticulturist.)

RHODODENDRON BLOOMING A SECOND TIME.—Is it not most unusual for a Rhododendron to be perpetual? yet to my great

surprise a shrub of the white Madame Miolan Carvalho is now in bloom in my churchyard (Dorset coast). This Rhododendron bloomed most freely in May, and as the blooms withered I carefully picked them off, leaving the green shoots which had come up alongside to go on and prosper. This they have done to such an extent that some are in bloom in September. As I never heard or read of this happening before, I thought I would communicate it to "our Journal," and ask whether it is not a most unusual event?—JOHN B. M. CAMM.

ASHMEAD'S KERNEL APPLE.

FRUIT, as in the annexed figure, below medium size, round and flattened, but sometimes considerably elongated. Skin, light greenish yellow, covered with yellowish brown russet, and a tinge of brown next the sun. Eye, small and partially open, placed in a moderately deep basin. Stalk, short, inserted in a round and deep cavity. Flesh, yellowish, firm, crisp, juicy, sugary, rich, and highly aromatic.

A dessert Apple of the very first quality, possessing all the richness of the Nonpareil, but with a more sugary juice. It comes into use in November, but is in greatest perfection from Christmas till May.

Fig. 77.—Ashmead's Kernel.

The tree is very hardy, an excellent bearer, and will succeed in situations unfavourable to the Nonpareil, to which its leaves and shoots bear such a similarity as to justify Mr. Lindley in believing it to be a seedling from that variety.

This delightful Apple was raised at Gloucester, about the beginning of last century, by Dr. Ashmead, an eminent physician of that city. The original tree existed within the last few years in what had originally been Dr. Ashmead's garden, but was destroyed in consequence of the ground being required for building. It stood on the spot now occupied by Clarence Street.

It is difficult to ascertain the exact period when it was raised; but the late Mr. Hignell, an eminent orchardist at Tewkesbury, in Gloucestershire, informed me that the first time he ever saw the fruit of Ashmead's Kernel was from a tree in the nursery of Mr. Wheeler, of Gloucester, in the year 1796, and that the tree in question had been worked from the original, and was at that time upwards of thirty years old. From this it may be inferred that the original tree had attained some celebrity by the middle of last century. The Ashmead's Kernel has long been a favourite Apple in all the gardens of West Gloucestershire, but it does not seem to have been known in other parts of the country. Like the Ribston Pippin it seems to have remained long in obscurity before its value was generally appreciated; it is not even mentioned in the catalogue of the extensive collection which was cultivated by Miller and Sweet, of Bristol, in 1790. I find it was cultivated in the Brompton Park Nursery in 1780, at which time it was received from Mr. Wheeler, nurseryman, of Gloucester, who was author of "The Botanist's and Gardener's Dictionary," published in 1763, and great-grandfather of the present proprietor of the nursery.

HYACINTHS IN GLASSES.

PROBABLY there is nothing original in my way of growing Hyacinths, yet as I do not know of anyone using it, except on my recommendation, it may be worth sending to you. It is this: The ordinary glasses which are used for growing Hyacinths

in water are filled with rotten dung and leaf mould, and about an inch of soil on the top, in which is planted the bulb. There is no drainage. The advantages I think are, equal vigour with those in pots, but better than in pots, for less evaporation from surface soil, and thus more healthful for dwelling-house, and requiring less attention in watering; the wire supports are available if required, neater in appearance. I have tried the plan for five or six years with good results. Last season the best spikes of flower were got this way as it happened, though those in pots were about equal.—H. T.

NOTES AND GLEANINGS.

It is reported that his Grace the Duke of Northumberland has offered to RECONSTRUCT and PLANT the space in Trafalgar Square, now occupied by the fountains and asphalt pavement. If this is so, we hope it may be planted with lines of Planes, and not converted into a garden, which, however well it might look when first planted, will soon lose its garden beauty. Lines of Planes in such a position would not only beautify and vary the appearance of the place, but would furnish agreeable shade during the hot days of summer—when we have any.

THE Central Horticultural Society of Paris has lost one of its most active and intelligent members in M. MARTIN-CANOT, who was prematurely carried off after a few days' illness. His loss, says a French correspondent, will be keenly felt by numbers of gardeners and other horticulturalists, to whom he was an adviser and friend. He was long gardener to the Princess Stourdzia, Faubourg St. Honoré, but afterwards turned his attention to landscape gardening, and in this capacity carried out a number of important works.

WE have received Dr. Schomburgk's Report of the progress and condition of the ADELAIDE BOTANIC GARDEN during 1873. It is highly satisfactory, but we must confine ourselves to two extracts interesting to our readers:—"It is a historical fact, whenever man settles into a new country he exercises a potent influence over the indigenous vegetation, especially if the intruders are of agricultural and pastoral pursuits. The plough, the axe, the herds, are enemies to vegetation; and as cultivation advances one representative after the other succumbs to the foreign influence. But the plough, the axe, the herds, are not the sole destroyers of the native herbage. With cultivation are introduced noxious weeds of other countries, which, if they have taken to the soil, spread with alarming rapidity, and become possessors of the ground, growing often more luxuriantly in their new abode. As an example I will only mention seven of such noxious intruders in South Australia—viz., the so-called Dandelion (*Cryptostemma calendulacea*, R. Br.), the Cockspur (*Centaurea melitensis*, Lin.), the French Catchfly (*Silene gallica*, Lin.), the Stinkaster (*Anthemis Cotula*, Lin.), the Bathurst Burr (*Xanthium spinosum*, Lin.), and Scotch Thistles (*Cardus Marianus*, Lin., and *Oenopordon acanthium*, Lin.), natives of the Cape and Europe, which already cover large tracks of pasture land, and will extend with rapidity further and further, to the destruction of the native herbage. The Government have legislated for compulsory destruction, and already spent thousands of pounds to check the Scotch Thistles and Bathurst Burr, but as yet only in the populated districts with success. We miss already several kinds of herbage, especially annuals or summer grasses, and the representatives are becoming less every year; but it is also the case with perennial herbage. I will only mention the useful Kangaroo Grass, which in the earlier days of the colony we found everywhere, and which formed a great part of the pasture grass. It has now disappeared even from localities which it formerly almost monopolised, and many others will follow.

THE labelling of the plants has been hitherto a constant source of trouble and expense to this establishment—the paint in the course of one or two years generally wearing off by the weather, and thus requiring a frequent renewal of these labels; but I am now in hopes of having found out a remedy by which the colour will stand. Several labels, which were painted and written in 1871, have withstood the influence of the climate. The labels are of sheet iron, and before painting them I employ first a mordant of the following composition:—One part of chloride of copper, one of nitrate of copper, and one of sal ammoniac are to be dissolved in sixty-four parts of water, to which solution is to be added one part of commercial hydrochloric acid. The iron or zinc labels are to be brushed over with this liquid, which gives them a darkish colour. In the course of twelve to twenty-four hours they become dry, and to

their now dirty grey surface a coat or two of any oil colour will firmly adhere. Our labels are painted black, and when dry the names of the plants are written with white oil colour, and immediately sanded with fine white sand. The sand will dry with the white colour, and become compact. As before mentioned, the first labels prepared with this composition were written in 1871, and show not the slightest effects of the weather."

— A NEW drug from Brazil has appeared in France under the name of JABORANDI. It consists of the leaves and small branches of a shrub growing in the interior of some of the northern provinces of Brazil, and from specimens which have come into the hands of Professor Baillon, it seems that the plant is the *Philocarpus pinnatus*, *Linna.*, belonging to the Rutaceæ. It is stated that this drug has been used with great success in France, and that it is looked upon "as an incomparable diaphoretic and sialogogue." Dr. Gobler expresses the belief that "it will be the first indisputable example of a diaphoretic truly worthy of the name—that is to say, a medicine having the power of provoking directly by an electric action the secretion of perspiration." — (*Medico-Pharmaceutical Abstract and Review.*)

JOTTINGS ON STRAWBERRIES AND STRAWBERRY CULTURE.

In reply to many inquirers who honour me by asking my advice as to the length of time they should keep their beds, and other points of culture, I can confidently assert that the plan of digging-up the plants every year, whatever persons in high places may say, is perfectly unnecessary, and only resorted to by those who do not properly prepare their ground in the first instance, and, moreover, know very little about Strawberry-growing, or the habits and requirements of the plant.

British Queen is acknowledged by many good growers to be as difficult as most kinds to grow successfully; but here, in a light soil with a gravelly subsoil, I find this sort do better the longer in season it is allowed to remain. I am aware that this rule will vary to some extent with soil and situation, as well as with the proper preparation of the soil, but in the main the proposition holds good. My beds of five and six years' standing have done so well and borne such quantities of fine fruit, that I have had them dressed to fruit the sixth and seventh years, and I shall not be surprised if they do not increase in productiveness till they are nine or ten years old, the ground having been trenched at the outset from 2 to 3 feet deep, and plenty of good farmyard manure, chopped turf, and old mortar rubbish having been well incorporated in the process. The ground was then allowed to stand some time "to pitch," as the old-fashioned blue-aprons say, and before planting was firmly trodden. A spade was never afterwards allowed to be used.

The beds are occasionally cleared as early as possible of any runners which have been overlooked, and the straw, tanner's bark, or whatever is used to protect the fruit, is also cleared away directly the plants have done fruiting, so as to expose the soil to the full influence of sun, air, and moisture, whether of rain or dews. The first year or two the beds only require to be slightly but carefully forked over. After the second year, when it may be supposed that the original supply of nutriment is getting exhausted, a little short rotten manure is carefully pointed-in with a fork, and this is done as early in the autumn as possible, a few of the outside leaves only being first removed to make all neat and to get a clearer field for the operation. In this way I manage to grow as fine Strawberries as most gardeners who talk very large in print about the sorts they have grown at their place, and who dictate the only sorts which should be grown, and those which in their opinion are worthless, however disparaging to the efforts of the raiser, and should therefore be condemned; forgetting that where the very best varieties fail in any particular locality, they succeed just as well in others, but frequently fail either from neglect, wilful or otherwise, or from some want not supplied in the cultivation.

As to the distances plant from plant, or whether in beds or lines, all is a matter of taste. The plants, whatever system is adopted, should not be closer together than from 21 inches to 2 feet, and many of my plants after the third year are at least a yard apart, and the plants when in fruit are nearly a yard in diameter, and require two of Paxton's crinolines—that is, four half-circles per plant to support the fruit. Next year I

am thinking of having crinolines made to fit the plants, a foot in diameter for the inner circle, and 2 feet 6 inches for the outer; they will then accommodate plants measuring a yard in diameter.

Runners should not, as a rule, be allowed to root on the fruiting beds. They not only smother the fruiting plants, but seriously impoverish the soil. The best plan is to grow a few plants, according to requirements, in lines for the special purpose, and to remove the blossoms as they appear. Runners will then be plentiful and early. Any barren plant should be at once removed. It would probably bloom the following year, but it is as well not to propagate from non-blooming plants.

I shall be glad to show these old-standing beds next season to anyone who doubts the results. If the season is a fair one for Strawberries in general, I do not doubt it in the least. I shall also be happy at the same time to show my various seedlings, several of them also of four and five years' standing, and notably Early Prolific, Duke of Edinburgh, Enchantress, Sir John Falstaff, Excelsior, Scarlet Pine, Bonny Lass (late seedling), Fair Lady, &c., and to prove beyond doubt that the first two, though I cannot grow them so well as some of my neighbours, are amongst the best early Strawberries grown, and only to be beaten, all points considered, by Early Crimson Pine, now in course of delivery; whilst of the others, together with Alpha, Amy Robsart, &c., as new early sorts, I will leave any visitor who may honour me to form his own judgment.

I am quite confident, both from my own knowledge and from the testimony of others, that Early Prolific is one of, if not the best of the early forcing kinds we at present possess, and the comparison with it of such sorts as Black Prince and Keens' Seedling is simply ridiculous. President is also a most excellent forcer, and makes a good succession; whilst as to Duke of Edinburgh, which I had not proved as a forcer, I was quite astonished to receive early in April last, from a near neighbour, a basket of the handsomest fruit I ever saw, which had been grown in pots under glass to be sure, but with little or no artificial heat. The colour and flavour were excellent, while as to the beauty of the fruit, partaking of the joint character of La Constante and British Queen, no very early Strawberry can excel it. I have no experience of it in stronger heat, therefore will not pretend to say how it behaves, but if it will throw off such large, handsome, fine-flavoured fruit as I saw in April last, with little or no fire heat, I say, despite the opinion of one at least of our would-be advisers, it is not a sort to be hurriedly discarded; and with regard to the general character of Early Prolific, I would rather accept the opinion of such men as De Jonghe of Belgium, and Gloede of Ifanburgh, the former of whom says it is a masterpiece of skill, and the latter has so often sung its praises, even within the last three weeks in "our Journal," that I need scarcely quote his eulogia; whilst at the late "election of Strawberries," under the auspices of the Rev. C. P. Peach, Early Prolific gained the first place as an early Strawberry.

I have not jotted down these remarks merely to extol my own productions, but simply to state as the result of my own experience what I know to be the truth, and also to elicit fair criticism, which appears to be the more necessary when we find persons credited with a general knowledge of gardening who speak of the qualities of the various kinds of fruit only from their own point of view, whether indirectly interested or not it is difficult to say, and who certainly do not make Strawberry-growing amongst other things a speciality. When I hear of Strawberries being cultivated so badly that the beds are destroyed annually, I begin to doubt the ability of such critics to form an accurate judgment of the value of any new kind, especially when such bygone sorts as Black Prince and Keens' Seedling are accounted the two best early sorts we have in cultivation.

Whilst on the subject of Strawberries, I may remark that I have been for some years trying to raise a good large-fruited variegated sort. I thought I had succeeded some few years ago in a seedling I then named Pandora, but which I could not allow my gardener to introduce, because on further trial and observation I found that it failed to set its fruit properly, and this appears to me to be the chief difficulty with variegated sorts. I hope now, however, thanks to Enchantress, that I have overcome that difficulty. I have a seedling from that excellent high-flavoured variety which bore fruit this last season equal in quantity and quality with its parent, whilst the foliage is handsomely variegated in pale green and yellow, with here and there a dash of crimson. I have preserved a nice little stock of runners, which are growing and variegating

their foliage most satisfactorily. It now remains to be seen next year whether the offspring will behave as well as the parent, and if so, the triumph will be a great one in adding a charm to another faculty never dormant in the lover of his garden, and of the many good and beautiful things with which we are surrounded.—W. R., *Morningside, Kidderminster.*

TEA.

Most botanists agree that there is but one species of the Tea tree in China, Japan, and India—*Thea sinensis*, and that the Green Tea, which has been called *Thea viridis*, and the Black Tea, *Thea Bohea*, and Assam Tea, *Thea assamensis*, are only varieties; and that the different kinds of Tea sold for domestic use are all the produce of the same shrub, but differ in flavour or quality according to the age of the leaves when gathered, and their mode of manufacture.

Though the produce of the same variety of the Tea plant, the Black and Green Teas prepared for exportation are mainly the growth of different districts of China, the Black Tea district being situated in the provinces of Fokien and Kiangsi, and the Green in Chekiang and Nganwhi; but the two kinds may be produced in either district, the difference being caused solely by the diverse methods of preparation. For the manufacture of Black Tea the freshly-gathered leaves, freed from extraneous moisture by a short exposure in the open air, are thrown in small quantities at a time into round flat iron pans, and exposed to gentle fire heat for about five minutes, which renders them soft and pliant, and causes them to give off a large quantity of moisture. After this they are emptied out into bamboo-sieves, and whilst still hot repeatedly squeezed and rolled in the hands to give them their twist or curl. They are next shaken-out on large screens and placed in the open air in the shade for two or three days; and finally exposed in iron pans to a slow and steady fire heat until completely dried, care being taken to keep them in constant motion to prevent burning. The chief difference in the manufacture of genuine Green Tea consists in the leaves being so long exposed to the air after rolling that fermentation does not take place, and in not been subjected to such a high temperature in the final drying; but the greater part, if not the whole, of the Green Tea consumed in Europe and America is coloured artificially by the Chinese to suit foreign trade. The Chinese distinguish a great number of varieties of Tea, some of which sell for as much as 50s. per lb.; but these fine kinds will not bear a sea voyage, and are used only by the wealthier classes in China and Russia, to which country they are carried overland.

The first mention in England of Tea as an article of consumption and commerce, is in a letter written to the East India Company by one of their Indian officials, Mr. Wickham, dated the 27th of June, 1615. He spoke of it by the Hindostanee name, *char*, and a small quantity (4713 lbs.) being

imported, it became a fashionable beverage; but its consumption was very limited, for it was never less than 100s. per lb., and sometimes was twice that price. The grandfather of the writer remembered when a boy partaking of it for the first time. He watched what the other guests did, and then did likewise. The cups were very small, no sugar or milk was added, and after the drinking was finished, the leaves taken from the teapot were put upon small biscuits and handed to the guests, who ate them!

In 1660, Pepys has recorded in his "Diary," September 28th, "I did send for a cup of tee (a China drink), of which I had never drank before;" and seven years after he tells—

"Home, and there find my wife making of tea, a drink which Mr. Pelling, the pot-tery, tells her is good for her cold and defluxions."

In the season 1871-72 there were imported into this country 147,000,000 lbs. from China and Japan, and 17,000,000 lbs. from India. The varieties are very numerous. Of *Chinese Green Tea* (Gunpowder sorts), Shanghai, Ping-suey or Pin's-head, Moyune, Imperial Moyune, and Canton. (Hyson sorts), Shanghai, Young Shanghai, Young Canton, and Twankay or Imperial Hyson. *Japanese Green Tea*, Gunpowder and Young Hyson. *Japanese Green Tea*, Gunpowder.

Chinese Black Tea (Congo sorts), Canton, Foo-chow-foo, Hung-muey, Oopack, Kaisou, and Oonam; (Pekoe sorts), Plain Orange, Foo-chow, Scented Orange, Canton Scented Orange, Flowery Pekoe, Oolong, and Souchong. *Assam Black Tea*, Congo, Orange Pekoe, and Souchong. *Japanese Black Tea*, Congo and Imperial.

Fig. 78.—*THEA BOHEA*.

SCABBED POTATOES.

In reference to the inquiries about the scabbing of Potatoes, I have seen it very often, but mostly in a warm sunny season and on light sandy soil, and it occurs to me that it arises from the soil being so hot that it blisters the skin of the Potato when it is in a tender state. At the same time I am told if lime is applied to the soil the Potatoes are sure to be scabbed.

Scabbed Potatoes are generally very dry and good, and they are always drier in a dry warm season than in one the reverse. There is a little blight to be seen in this county, which is famous for Potatoes. The Dunbar Red sort is much prized by the Londoners. The Victoria variety in my garden is quite free of blight, and bearing early clusters of apples, which is rare now, and has been since the first blight in 1845. It is of importance to raise new varieties from seed, and to abandon the old sorts, as they are more liable to blight than those recently raised from seed, of which Victoria is an example with me.—JOHN ADDISON, *Ormiston, Tranent, N.B.*

NOTES ON VILLA AND SUBURBAN GARDENING.

I WILL this week return to the greenhouse and conservatory, and name a few other plants that ought to be grown for their decoration. The list will not be a long one, but I intend to

select a few of these plants most easily grown, believing that these are the things to be appreciated by the amateur rather more than plants of a very tender nature. Beginning first with Ferns, there are the well-known *Adiantum cuneatum*, *formosum*, and *venustum*; the former an excellent Fern to afford fronds for cutting, but requires to be kept in the warmest part of the house, and in a moderately moist position. The other two sorts are somewhat hardier, and will do with greenhouse treatment. Some others that will thrive under the same conditions are *Asplenium bulbiferum*, *flaccidum*, and *lucidum*. The former is an erect-growing sort with vigorous habit, and has a handsome appearance; the next is more graceful in appearance than either, having a drooping habit, which is suitable for suspending in baskets. Then we have *Cyrtium falcatum*, a Fern with fronds of a totally distinct character, and is one to be recommended for its ornamental appearance; and being a Fern that is almost, if not quite, hardy in the south of England, it may be looked upon as one of easy culture. I might also name *Davallia bullata*, a Fern of a creeping nature, dwarf habit, but with handsome fronds; this ought to grow with the *Adiantum*. *Doodia caudata* is another pretty Fern, also *Lomaria gibba*, a miniature Tree Fern, but common enough now in cool greenhouses, and is quite distinct from any of the others named. *Nephrodium molle corymbiferum*, an erect-growing sort with darkish fronds. *Nephrolepis exaltata*, too, must not be omitted for baskets; it is rather loose in habit, but its long, narrow, graceful fronds make up for all that. Then we come to the *Pterises*, of which there are several, such as *serrulata*, *longifolia*, *serrulata cristata*, and *tremula*, all of which, and many more, are greenhouse Ferns of the easiest culture. They also make capital window plants, but they must not be allowed to stay too long; and for placing on the dinner-table or in vases in entrance lobbies they are especially handy. There is also another class of plants which possess the last qualification, but are of dwarf habit, and as they can be made to grow in the smallest vessel, how handy they are for placing here and there on the drawing-room tables, mantelpieces, and other places, where they look nice but do not obstruct. These are *Selaginellas denticulata*, *flexuosa*, *involvens*, *stolonifera*, and *Wildenovi* as about the hardest and easiest grown. They delight in moisture overhead when growing, they then throw out their little fork-like rootlets, which support the fronds in an upright position. If larger specimens are wanted, grow them in pans 5 inches over and peg down the fronds. After a time they throw out fresh ones, which will grow erect; place between these some small lumps of turf, and peg them to it, and as they grow continue adding to it until a large plant is built up. While this is going on give them moisture overhead frequently, which is their principal support, for they make very little root in the pan in which they are potted.

All the above plants enjoy a soil made up of two-thirds peat with plenty of sand added, and one-third loam broken up or sifted fine, and small pieces of charcoal added to the whole, which keeps the soil open. The drainage ought to be perfect, using some charcoal in it, and cover it over with dried moss or any other light dry material to keep the soil from mixing with the drainage. Pot the most of them rather firm, excepting the *Selaginellas*, which must be potted rather light. Let me mention another plant easy to grow—*Isolepis gracilis*, a kind of Grass, with its foliage of a nice green, and falling closely and gracefully over the pot so as in some cases to entirely hide it. This likes a loamy soil with a little peat added, and to be potted firm. This plant will bear any amount of moving about so long as it is well supplied with moisture, and transferred to the warmest part of the house when turning or inclined to grow out of its ordinary green colour. *Tradescantia zebrina* is another very ornamental plant which will grow well in these little town conservatories. It produces a profusion of small handsomely-marked leaves, and has a creeping habit. It is suitable, and looks elegant when suspended in pots or baskets. It grows fast, and when the shoots become long or naked take the points of them off and put them thickly into a small pot filled with fine sandy peaty soil, and they will root quickly. This is the way to keep a pot or basket of fresh-looking plants with the leaves of their true ornamental colour.

Among fine-foliage plants as well as flowers there is the pretty compact-growing *Begonia Weltoniensis*, a greenhouse autumn-blooming sort of the easiest culture. It is an odd-looking root, which forms a crown as the plant increases in size, so that after it has ceased flowering the shoots may be cut off, and young ones soon form, which may be propagated in the ordinary way; or the plant will succeed if, after the shoots break into growth, the soil be shaken from the roots and repotted in rich loam and peat, growing it on in an intermediate temperature until it comes into bloom, when it may be placed in a more airy part of the house. Then there is the old *Gesnera zebrina*, which does so well upon the shelves of the conservatory when it has light and air, the latter in a moderate degree. It may not flower so freely in such a place as in a stove or warm house, but its foliage generally comes to a good colour, and is so ornamental as to make it

worth growing. It flowers in winter, and dies down in spring. The plants are produced from little scaly tubers produced in the soil. After the plant dies the soil should be kept dry till wanted for potting, when the tubers may be turned out and potted about from five to seven in a pot, using a soil of loam and peat in equal proportions, with sand and charcoal added. It is not proper to allow moisture to settle on the leaves after they approach their full size, otherwise it spoils that velvety appearance which makes this plant so attractive. The common Musk, which everyone is acquainted with, is also a very excellent autumn-blooming plant. It is always advisable to fill a dozen pots with the roots in the spring of the year, let them grow and flower, which they will do abundantly and without requiring any special treatment, and the plant will grow in almost any house or window in any town. After the first flowering is over stand the pots aside for a month or more, then cut the tops off close to the pot, water the whole well, and keep it moist; very soon the shoots will appear in abundance, and form a most lovely and attractive plant for almost any purpose. As a window plant it stands almost unrivalled for its ease of culture and abundant bloom.

Those who have got a flower garden may take measures to secure some of the best of the *Geraniums* for use in the conservatory by digging round them, and keeping others near them from interfering with their growth. After a week or two these may be potted carefully and taken to the house, where they ought soon to recover themselves, and in time produce a little bloom. The same may be said of *Lobelias* and some few other things.

Those who grow the *Solanum Capsicastrum*, and everyone should, for it is a capital plant for town gardens and winter decoration of a greenhouse, should be planted-out in May in the open ground, and after the plants start into growth the little white flowers make their appearance in abundance, especially on old plants; these in time produce a green berry, which grows to the size of a small Cherry. After the middle of September, or not later than the first week in October, the plants must be taken up with great care, with as much soil attached to the roots as possible, put them into pots not over-large, water them abundantly, and keep them from the sun until are well established, which does not take more than a fortnight, then transfer them to the greenhouse, and before a week is past the berries will begin to change to red; this they will all do in time, and if the berries are numerous, which they generally are under ordinary conditions, the plants will become the most handsome and useful plants in the house.—THOMAS RECORD.

DOINGS OF THE LAST AND PRESENT WEEKS.

HARDY FRUIT GARDEN.

WE are now making preparation to go on with digging and trenching. In our light soil (which under any circumstances from the quantity of sand and gravel that it contains, it is not very important to have this done early. On heavy soils the reverse is the case; the ground ought to be turned-up to the ameliorating influences of the atmosphere as early as possible. Intending planters of fruit trees should now have the ground prepared for them. It is quite necessary to have it trenched, and if the soil is poor some rotted stable manure may be worked-in during the operation. It may not be out of place to allude to the operation of *trenching*. This must not be done anyhow and at any time. When the ground is too wet for other operations, it is not uncommon to go on with the trenching, and men may be seen at work with the soil a perfect puddle under their feet. Now, this puddle may be thrown into the bottom of the trench out of sight and out of remembrance, but it is certain that the crop for next season will not be improved by it. Another instance may be quoted, and that is ground that has been trodden upon for weeks and months until it is as hard as a footpath, is trenched-up and the hard surface is carelessly thrown in the bottom of the trench without being broken-up as it ought. Before commencing to trench hard ground it is best to break-up the surface with a fork, and let it lie for a week or two, the loosened surface is then thrown into the bottom of the trench, and in that state is well adapted for the roots of all vegetables and trees to work into.

Besides trenching and preparing the ground, when trees have to be purchased it is desirable to look after them in good time, either by giving the order to the nurseryman early, or going to the nursery and selecting them personally. Two-year-old trees are the best, and they should be clean and regularly furnished with branches. For small or medium-sized gardens, pyramid or bush Apples on the Paradise stock, Pears on the Quince, except a few that do not succeed on that stock, and a few Cherries on the *Cerasus Mahaleb*. Cherries budded on this stock bear early and abundantly; the only objection to their culture is, that the fruit is carried off by marauding birds before it is quite coloured. It is easy to throw some netting over the trees before they grow to a large size, but when the trees become

from 10 to 15 feet high, and as much in diameter, this cannot be managed so easily.

Then as to planting. A hole must be dug-out wide enough to allow the roots to be spread out, and some rotted turfy loam should be shaken-in amongst the roots, and trodden-in firmly with the feet. It is not uncommon to plant young trees in rich soil, loam mixed with manure, &c., but this is wrong; all such rich composts ought to be avoided, as tending to produce gross growths, which ultimately produce gumming in Plum and Cherry trees, and canker in the Apple and Pear. The trees will grow freely enough with the turfy loam, and will form a perfect network of fibrous roots into it. Then as to wall trees. If it is important to be early on the alert to select the best trees for the open borders, it is even more important that those intended for walls should be clean, healthy, and well balanced. Trees three years old are the best to purchase for this purpose, and usually they have five or seven young growths which have been properly trained the previous summer. Do not plant too close to the wall, and the ground ought to be allowed to subside before nailing in the tree.

Running the hoe through Strawberry beds and cutting-off the runners once in ten days or a fortnight. We have explained in previous numbers that it is our custom to destroy the Strawberry beds as soon as the fruit has been gathered, and the runners obtained for the following season. Of course, the system of annual renewal could not be followed out if the runners were not planted-out early, and the plants kept quite free from weeds and superfluous runners.

Vines.—During the last week the weather has been very unfavourable to the keeping of Grapes, and a few berries have shown signs of damp. Where there are no plants in the houses to cause damp there is not much difficulty in keeping Grapes at this time of the year, but if the weather prove unfavourable it will be necessary to keep-up the heat from the hot-water pipes, and to open the ventilators freely by day, keeping the house closer at night, and not allowing the pipes to become quite so warm. The earliest houses here are not started before December. Those who begin to force in November should now prune their Vines, and make the usual preparations. Mildew has been very prevalent this year, and it would be as well to impress upon the minds of all who have been annoyed by this insidious parasite during the past season, that now is the time to use preventive measures, and prevention is not only better but easier than destroying it, after the parasitic threads have taken hold of the leaves and berries. As soon as the Vines are pruned, wash all the wood (after having removed the loose bark), with warm soft water in which soft soap has been dissolved to the extent of 3 ozs. to the gallon. The water should be applied with a sponge. Before the rods are quite dry, paint them with the same water thickened with flowers of sulphur. This is sufficient as far as the part of the Vine above ground is concerned. Now to the roots: What is the state of the inside border? Probably it has not been watered since the Grapes began to colour, and is dust-dry. It is quite a mistake to allow the roots to get into this state, as it is so difficult to get the soil sufficiently moist again. After repeated waterings the surface may be moist for a few inches in depth, and as no examination is made further than this, the cultivator fancies that it is all right with his Vines. They may start well and grow away freely at first; but if the border is dry underneath, this healthy growth will not continue, lateral growths will not be produced, or, at least, not freely, consequently the Vines are predisposed to the attacks of red spider and mildew. The condition necessary to conduce healthy root action is first, thorough drainage. It is not always necessary to lay drain-pipes to carry the water to an outfall, but at least a foot or 18 inches of brick-bats or rough stones should be laid underneath the border to allow the water to drain away from its under surface. Second, the border should not be allowed to become thoroughly desiccated, as is too often the case; but even when the Vines are at rest it ought to be moderately moist. Third, when the Vines are started give a thorough good watering, enough to soak quite through to the drainage, so that the entire mass of roots are saturated. We treated a house as recommended above, where the crop of Grapes had been destroyed for twenty years by mildew, and the Vines after being allowed one season to produce fruit-bearing wood, carried a splendid crop of fruit the next season and were free from mildew.

FLOWER GARDEN.

The continued wet and hurricanes of wind have sadly marred the beauty of the flower beds. There is still a good prospect of bloom, however, if the weather would continue fine, as it has been for the last day or two. Picking withered trusses of flowers off, and cutting away growths that have grown out of bounds, and keeping the beds free from weeds. The autumn-flowering Roses are exceedingly brilliant, and if there is one that could be singled-out for its glowing flowers it would be Général Jacquemiot. Charles Lefebvre is also magnificent. The best and also the largest quantity of autumn flowers are produced from those worked on the Manetti stock. Put in cuttings of Tea

Roses; these strike freely if taken off with a heel in lengths of from 3 to 6 inches. They may be inserted from six to twelve cuttings in 5 and 6-inch pots. The soil should be equal parts of loam, leaf mould, and sand. The pots are placed in a cold frame, and watered sparingly. They will throw out roots more freely in August, but very few cuttings will fail to produce plants if put in now.

Getting cuttings of all such bedding plants as Verbenas, Heliotropes, Ageratum, Cuphea, platycentra, &c. What a very fine free-blooming plant is this last, and how seldom it is seen now! It is a perfect mass of flower, and not the least of its recommendations is that it does not require any attention, either training or picking off withered flowers; and one of its greatest recommendations is that the plants can be wintered in any house from which the frost is merely excluded. All such cuttings are put into either boxes or pots, and put into a cold frame; bottom heat has a tendency to cause damp, which is injurious. Cutting the lawn frequently and sweeping up fallen leaves, so that the signs of coming winter may be kept out of sight as long as possible.—J. DOUGLAS.

TO CORRESPONDENTS.

* * It is particularly requested that no communication be addressed *privately* to either of the Editors of this Journal. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably.

BOOKS (T. P. C.).—"The Cottage Gardeners' Dictionary," you can have it by post from our office if you enclose 7s. 2d. with your address. (David).—We know of no book devoted to forcing all kinds of vegetables. Keane's "In-door Gardening" contains weekly directions for forcing them. You can have it free by post if you enclose twenty postage stamps with your address.

GARDENERS' DIRECTORY (B. M. A.).—It is published at our office.

VARIEGATED IVIES (Knutsford).—Any of the nurserymen near London who advertise in our columns could supply you.

HOES (W. T.).—If you enclose six postage stamps with your address, and order Town's "Plantation and Management of Hops," we will send it post free.

IMPROVING GARDEN SOIL (W. H. B.).—For a soil of your description there is no doubt an application of clay or marl would be the most enduringly beneficial. If you have this at hand it may be laid on the land in spadefuls and at the rate of a hundred cartloads per acre. After the first frost sufficiently severe to freeze the lumps through, it will upon a thaw fall, and when the ground is in working order the material may be dug-in. It ought, therefore, to be applied in early winter. Failing the clay or marl, you may add strong loam a dressing up to 6 inches thick, and mix it well in digging with the soil. A good dressing of cow dung would also be good, as it is more moisture-retaining and cooler than stable manure. For the Roses improve the staple of the soil by adding soil of a more retentive nature, and manure well. On so light a soil they would probably do well on their own roots, and certainly ought to be on the Manetti, as the Briar does not succeed on light soils. Manure liberally, and water freely during growth.

EVERGREENS IN POTS FOR HOUSE DECORATION (H. R. L.).—You are on the right track. Tender subjects are employed when hardy ones would answer equally well, and with less injury to the plant. *Aralia Sieboldii*, fine, fig-like, glossy green leaves, a few plants for select positions; *Aucubas limbatas*, longifolia, japonica (maculata), hinalcica, the second and last green-leaved, the other variegated; *Berberis Darwini*, *B. (Mahonia) aquifolia*; *Buxus arborescens* var. *argenteus*, *Handworthianus*, *aureus*, *pyramidalis*, *B. balearicus*, *B. suffruticosus elegans*; *Cerasus latifolia*, *C. luscitana*, *C. myrtilloides*, *Cotoneaster microphylla*, *C. Simmondsii* (though only semi-evergreen, is fine in berry); *Daphne laureola*, *D. cneorum*, and var. *variegata*; *Desfontainia spinosa*, *Eleagnus japonicus* variegatus and *Eurya latifolia*, though not very hardy are fine variegated subjects; *Eunonymus gracilis roseus* variegatus, *E. japonicus argenteus* variegatus, *E. gracilis aureus marginatus*, *E. radicans* variegatus; *Hollies* in variety, *Laurustinus*, *Ligustrum japonicum*, *Osmanthus ilicifolius argenteus* variegatus, *Skinamia japonica*, *Vinca elegantissima*. Of Coniferous plants:—*Abies Albertiana*, *A. excelsa* var. *Clanbrasiliana*, *elegans*, *inversa*, *pumila*; *Chamaecyparis thurifera*, *Cryptomeria elegans*, *Cupressus Lawsonii* and var. *gracilis* and *stricta*, *Retinosporas ericoides*, *pisifera*, *plumosa*, *obtusata nana aurea*; *Taxus adpressa stricta*, *T. pyramidalis aurea*, *T. elegantissima*; *Thuja japonica borealis*, and vars. *glauca* and *variegata*, *T. dolabrata*; *Thujas Lobbi*, *plicata*, *aurea*, and *elegantissima*. The tree *Ivy* are very fine, both the green and variegated forms.

TAN FOR SEA-KALE FORCING (St. Edmund).—You may take-up the roots any time after Christmas and place them in the spent tan level with the crowns, placing them with the crowns about 8 inches apart, and so that they may be covered with an inverted pot or box to exclude light, adding other covering so as to thoroughly exclude the light, and so secure the thorough blanching of the growths. Or you may place the roots in a box and cover it over so as to exclude light. The tan should be moist, and when the growth is begun you may water with tepid water, one or two waterings being sufficient. To save placing a box or inverted pot over the crowns, you may bury the crowns 8 to 9 inches deep with the tan, the tan being moist or watering at planting no more will be required until the Sea-kale is fit to cut, which it is when the shoots are showing through the surface of the tan.

LILY OF THE VALLEY NOT FLOWERING (Idem).—The Lilies ought to have flowered within three years after planting. Either they are planted very thickly and so are deprived of light and air, and are very dry in summer, or they are in a poor soil and dry in summer. If the first, thin them out, leaving clumps 9 inches across, and the same distance between all around, and fill-in between the clumps with good rich soil, planting those removed in clumps of about 4 inches across, 9 inches apart every way, the soil being enriched with leaf soil or well-rotted manure. They do best in a border shaded from midday sun, and will flower all the better for good supplies of water in dry weather during growth. If they are not crowded top-dress with good rich

compost, as old manure and leaf soil, and water freely in dry weather. A north or east border is better than a southern one.

CUTTING-BACK RHODODENDRONS (*Hermit*).—They may be cut-in to any extent and form desired, and will start again freely, but will be a few years, if cut-in much, before they become good specimens. The best time to cut them back is in April, though you will by cutting so early lose next season's crop of flowers. It is well if in cutting-back you can leave some young growths, as they start more freely from young growth than wood of considerable age. If weak as well as old, it is likely they may not start again freely if cut-back to the old strong wood. We have cut-back some from appearance over fifty years old, which have started freely and are forming good specimens.

SOWING WINTER GREENS IN AUTUMN (*A. T. W.*)—Savoy, Brussels Sprouts, sown in August at the same time as the spring or early summer Cabbage, come in much earlier than those sown in spring, they being pricked-off in autumn and planted-out in March or early April. They will be in use in August onwards, and attain to larger proportions than spring-sown. The sowing then in drills a yard apart and thinning-out appears to us a waste of ground, and one that can ill be spared in most gardens. Spring sowing is mostly adopted, as very few care to have Savoy or Brussels Sprouts when Cabbages, Cauliflowers, and other subjects are plentiful, and from the ground employed for Winter Greens can be had a crop before the winter stuff need be planted—in time for their attaining a size large enough for table by October onwards.

TAKING-UP BEDDING GERANIUMS (*Idem*).—The end of the present or beginning of next month is sufficiently early to remove bedding Geraniums. They may, as a rule, be left until the first frosts in October. The choicer kinds should be removed before frosts occur which cut off Dahlias, the early part of next month being sufficiently early for most and generally all; but the seasons vary somewhat, though, as a rule, it is not until the middle of next month that damaging frosts occur.

WINTERING SEEDLING PANSIES (*H. P.*)—If very choice kinds they may be potted up in good turfy loam with a fourth each of leaf soil and well-rotted manure intermixed, employing 3 or 4 inch pots, according to their size, and placing in a cold frame in a dry sheltered situation, plunged to the rim of the pots in coal ashes. Here they may remain over the winter until spring, having air whenever the weather is mild, shifting into larger pots in February, or so soon after as the weather is favourable, if they are to be flowered in pots; if not, harden-off and plant-out early in April. The lights ought to be drawn down in mild and fair weather, be over the plants when mild but wet, the lights being tilted so as to let the plants have air; in frost only should they be down over the plants, and in severe weather the lights should have a covering of mats in addition to the lights. If of ordinary kinds they may be planted at once in the beds or borders where they are to flower, or if small pricked-out in a sheltered border 3 to 6 inches apart, according to their size, planting them out where they are to flower in March or early April, lifting each with a ball, and watering if the weather be dry.

BULBS IN BED OF DROMPTON STOCKS (*Frank W.*)—It will not answer to plant bulbs between the plants of Stocks, but you may transplant the Stocks so as to have a centre of them with the bulbs arranged as to height around them so as to form the front lines of the bed.

HELICHRYSUM FLOWERS DRYING (*Idem*).—Cut them on a dry day with all the stalk you can before they show the centre, and lay them thinly on paper or on trays, and place out in the full sun daily for a few days, or if wet keep in a dry airy room, keeping from wet, and when the stalks have withered tie in bunches, and suspend in a dry room free from dust. The bunches should not be large, or the flowers may mould, which they will also do if in a place with a moist close atmosphere before they are thoroughly dried.

STORING POTATOES (*T. Bull*).—The best mode of keeping Potatoes is in a dry outhouse in layers, alternating with layers of dry sand, and the heap covered 3 inches deep with sand. In boxes with layers of sand would do.

YELLOW TEA ROSE (*R. H. W.*)—The yellow Tea you refer to, we believe, the old Sulphurea Odorata, the first true Tea introduced from China, called sometimes Crystalline; the bud egg-shaped, long in form, good-shaped petal, very sweet, of the distinctly Tea-scented type. We believe this was introduced into England by Mr. Parkes in 1824, though there were other varieties called Teas known before then—even as early as 1793, but none, we believe, are still in existence except this Sulphurea Odorata; and it is a question whether they were of the true type, so that we may consider the Sulphurea Odorata crossed with others to be the parent of the true Teas. One of the oldest, Devonians, is not true to this type, but has evidently Noisette blood, just as Gloire de Dijon has Bourbon blood. We shall be glad of further notes on Teas.

ROSES FROM CUTTINGS (*K.*)—This is a good time to put in cuttings of Roses. Any of the firm shoots will do, they having three joints, inserting them in a light sandy soil on a north border, cutting transversely below the lowest joint, removing the leaf from it, and inserting to the next in the soil, pressing the soil firm around them. By the April following they will be fit to take up and pot, or may be planted where they are to remain. The cuttings may be 6 to 8 inches long, inserting them half their length in the soil, but moderately strong shoots with three joints are best. Roses on their own roots are not nearly so free in growth as those on the Manetti stock. They will have the advantage for a hedge on their own roots of not troubling you with suckers, those they give being of the right sort.

ILL-FRUITING MOORPARK APRICOT (*Idem*).—You do not say if the tree is vigorous. We presume it is not. Remove the surface soil down to the roots, clear it away and replace with fresh loam, not strong, mixed with a sixth of old mortar rubbish and a fourth of well-rotted cow manure, and put on firmly, not covering the roots deeper than 6 inches, and mulch with short luty dung; water well next year in dry weather. The Peach is a very good one. We have known larger, but a Royal George 9 inches round and weighing 6½ ozs. is good.

ORANGE SEEDLINGS GRAFTING (*Idem*).—The stocks may be grafted in spring when they are beginning to grow, the stocks being had slightly in advance of the scions, they being kept close until the union is effected. We do not know where you may secure scions; probably Mr. Rivers would supply you. It would be better if you had plants of the kinds named—St. Michael's Tangerine, St. Michael's, Maltese Blood Oval, Pernambuco, Botelha, and Selecta.

WINTERING BEDDING GERANIUMS (*Inquirer*).—Your plants being in boxes will be safely wintered in the greenhouse, assigning them a position near the glass, and watering once or twice a week as the state of the weather may require. We could not say how often they will require water, so much depends on the position of the plants and the state of the weather. If on a shelf or stage over the flue, water may be required every other day, or the plants will

part with moisture more freely than were they in a cooler and less dry position; but if away from the flue, water will not be required often than once in dull weather and twice a week in bright weather. The soil should be so moist as to keep the plants from flagging, otherwise it should be dry. The plants should be potted-off in March, placing in a frame, and encouraging growth with a moist and rather close atmosphere, and free waterings at the roots when they are well rooted.

MAGNOLIA GRANDIFLORA OVERGROWING ITS POSITION (*M. E. M.*)—If the tree is perfectly safe from the wind we would let it remain as it is until March, when large portions of it may be cut away, leaving still some to occupy the whole space, or nearly so, which tie up, and the after-summer growth will efface all tokens of the knife. We prefer March to cut all kinds of evergreens, for the reason that the unsightliness caused by cutting is the sooner remedied by the spring growth which is fast approaching. We do not think any harm would ensue by the operation being done in autumn, but the plants would only remain all the longer in an unsightly condition, although in the case of a Magnolia with plenty of foliage all over it this need not be the case; but we have known Magnolias so thinned in autumn, which of course exposes the remaining leaves to more exposure than would have had if others had been there to protect them, that we have seen the trees almost denuded during the winter, that we prefer the March cutting-in.

DESTROYING THISTLES AND COLTSFOOT (*Camjee*).—We only know of one way of keeping the Thistles down, and that is by close and persevering spading in them as they come up, not allowing them to get a foot high or more. In a large extent of grass land we have in hand it has been our practice for many years to allow our shepherd, who is a decent industrious man, 3d per acre for keeping them down all the year, and he certainly has decreased them very much by the spud alone, or, what I find he likes better and is equally the same, a sort of narrow hoe—one not more than 2 inches wide, used in the same way as the spud, but he says quicker. We certainly object to moving Thistles where sheep is kept: a nasty hard stump is left, very hurtful to sheep's feet. Some pastures are very much addicted to Thistles, and the only remedy we know of is the constantly attacking them as they come up; even with that it will take some years perhaps to extirpate them, but they will be reduced. Coltsfoot we have not had so much experience in, as it is seldom they are found in the same place. With us Coltsfoot grows mostly in moister places, and often underneath trees. We confess not to have had much experience with it in grass lands, but believe it may be considerably checked by frequent mowing. Attacking the roots, we fear, will be a difficult job, as we know of nothing that roots deeper. Usually, however, it is a weed more troublesome in tillage than pasture lands, and in the latter there seems a difference of opinion about its effects on cattle. Certainly in some conditions they eat it with avidity, but whether to the hurt or not the small quantity that has come under our notice has not been sufficient to enable us to judge of. We would, however, endeavour all we could to extirpate it, and if sheep eat it without harm it would not be a bad plan to pen them upon it during its growing season. A friend of ours who had a field addicted to growing Ox-eye Daisies (*Chrysanthemum leucanthemum*), which no amount of weeding could extirpate, fed it off one season very closely with sheep, and was very little troubled afterwards. Perhaps the same will follow in your case.

MEALY BUG IN VINERY (*Subscriber*).—You probably keep your vineery too dry and close. Admit more air, and keep the air moist. Have every branch and stem brushed over sedulously with a hard brush, and then with a painter's brush as thoroughly painted over with this mixture:—Soft soap, 2 lbs.; flowers of sulphur, 2 lbs.; tobacco, 1 lb.; and a wineglassful of spirit of turpentine. Mix the sulphur, turpentine, and soap into a paste with warm water; boil the tobacco for an hour in a covered saucepan in some more water, strain it, mix it with the soapy mixture, and then add enough water to make five gallons.

NAMES OF FRUITS (*F. W. P. Dublin*).—Pears—1, Red Doyenné; 2, Marie Louise; 3, Williams' Bon Chrétien. Grapes—Apparently either Black Hamburgh or Black Prince. If the former the leaves will die-off yellow, and if the latter purple. Apples—1, Hollandbury; 4, Nonpareil; 5, Hawthornden; 7, Emperor Alexander; 9, Boston Russet; 10, Ravelston Pippin; 11, Russet Nonpareil; 12, Braddick's Nonpareil. (*J. Green*).—It is one of the ornamental Crabs.

NAMES OF PLANTS (*H. W. W.*).—1, *Centrostemma multiflorum*, *Dnc.*—(*Bot. Mag.*, t. 5173.) 2, *Eranthemum Andersoni*, *Mast.*—(*Bot. Mag.*, t. 5771.) 3, *Saxifraga sarmentosa* var.; 6, *Pteris aquilina*; 7 and 13, *Polypodium vulgare*; 14, *Lactuca Filix-mas*. We do not undertake to name more than six specimens at a time. (*Atlee*).—5, *Corydalis lutea*. Remainder too withered. (*H. P.*)—We do not name more than six specimens at a time even when they are in a fit state, which most of yours are not. 3, *Humea elegans*; 10, *Nierembergia filicalis*; 16, *Ageratum mexicanum*; 1, *Polygala oppositifolia*, or an ally; 15, *Eucalloma* sp.; 9, *Rhynchospermum jasmynoides*. (*J. W.*)—*Populus tremula*, *Aspen*, and *Alchemilla vulgaris*, we believe, but cannot be sure without seeing the inflorescence. (*R. Corbell*).—*Datura stramonium*, *Thorn-apple*. (*Birdie*).—2, *Amaranthus caudatus*, *Love-lies-bleeding*; 7, *Arbustia purpurea*. *Veronica speciosa* is not numbered, and is the only other specimen with its flowers. The others are mere leaves. (*E. S.*)—The yellow flower *Corydalis lutea*, Yellow Fumitory; the blue, *Linaria cymbalaria*, Ivy-leaved Snaydragon.

POULTRY, BEE, AND PIGEON CHRONICLE.

ENDEAVOUR TO AVOID DISEASE.

It is said a gentleman once waited on the celebrated Sir Astley Cooper. When asked his malady, he said he had none. His motive for coming was of a preventive nature, but it could be attained only by consulting a competent medical authority, and he had therefore sought the most eminent. He wished to know when, in this climate, a man might safely leave off flannels, and when take to them again? Sir Astley smiled, and said, "You ask me when you may safely leave off flannel, and when take to it again. You may leave it off on the eve of Midsummer-day, and take to it again on Midsummer morning."

The climate of our country is as trying for fowls as for human beings; and as after the long drought we may look for broken weather, we venture to advise our poultry correspondents, just

as at certain times agricultural papers advise as to ploughing, manuring, &c. When the nights get longer, and when the white frosts succeed each other, it is always time to get the chickens under cover to roost. Warnings are not wanting in the way of incipient colds, of ominous sneaks and short coughs at night when they roost out of doors. Our chickens are reared some distance from the roosting house they occupy in the winter. Many of them still pass the night in the rips in which they lived while chickens. We shift these every night some three or four yards nearer to the house they are to inhabit. Those that roost on rails and in trees we catch after dark and put them to roost in the house. This is not necessary where they are in good farmyard and safe sheltered places, but in the long dark nights it is not well to allow them to occupy exposed and dangerous places. It is often putting temptation in the way of those who are not scrupulous. Arrived at the equinox, and having to do with many that are not adults, it is most essential to feed at the last daylight and the first dawn. The food may be also rather more generous. The sun is hot, but the mornings and evenings are cold, and they feel the change more than they do the cold weather when they are seasoned to it.

THE BIRMINGHAM SUMMER SHOW.

BIRMINGHAM people have a spirit about them, an enterprise, a go-a-head determination, which is, perhaps, unequalled by the people of any town or city in the kingdom. My readers will at once think of several distinct fields in which this spirit has been manifested. Let me point here to one—viz., poultry. At Birmingham the first poultry show was held, and at Birmingham for many many years the best poultry show was held. But we connect that Show with winter. Oh, the friends one has met for years at Bingley Hall at Christmastide or thereabouts! Now most people would be satisfied with a winter success, but Birmingham pluck says we must have a summer show as well. The second summer Show is to be held on the 24th and three following days of this month. The amended schedule of that Show is before me. Truly it is a liberal one. Black Cochins are to have a class in addition to other Cochins. White Cochins are to have a class, and a gold medal for the best Frillback. Looking down the list of prizes one is struck with the liberality of the Committee—£5 and £3 cups, £2 prizes for fowls, £3 cups for Pigeons, and 41 prizes. To show how comprehensive is this schedule I will quote the part headed "Tumblers." There are prizes for Almonds, Balda or Beards, other Short-faces, Long-faced Flying Rose-wing, Red-breast, Mottled, Muff-legged; Long faced Flying Saddle or Badge, or any other variety Muff-legged; Long-faced Flying, Clear-legged any colour. With such a prize list and such spirit the Committee, if they do not achieve success, at any rate they will deserve it; and I sincerely trust they will so have the support of fanciers and exhibitors that they will achieve success. No schedule ever issued by a summer-show committee can at all compare with this from Birmingham. The views of the breeders of almost every known variety of both poultry and Pigeons have been met. Thirty-four cups and special prizes for Pigeons, and the same number for poultry, besides liberal money prizes, must surely cause a show to succeed.—WILTSHIRE RECTOR.

BATH POULTRY, PIGEON, AND CAGED BIRD SHOW.

For some time past huge and many-coloured placards had announced "The First Grand Bath Poultry, Pigeon, and Caged Bird Show," in conjunction with the regular autumn Flower Show in the Sydney Gardens. I paid very little attention to the placard; and knowing Bath would not even have the West of England Show held near it, and that in spite of her population the "fair city" had never done anything in the way of poultry to distinguish herself, I made up my mind to a dead failure—one small tent nearly empty, committee-men angry with each other, "and all throwing blame upon some harmless neighbouring fancier or two, who would make them get up that absurd thing, a poultry show." I pictured the tent empty of visitors, and the depressed attendants having sold exactly one dozen catalogues, bearing in mind how empty always is Bristol Show. Still, though I knew it would be a failure, I felt I must go; so I would go in, peep a minute or two at the birds, and take off expected depression at the Flower Show, which is always good. Mark, I had heard nothing about the entries, I knew none of the managers.

Well, I went to Bath on Wednesday (2nd inst.), the first day of the Show, and found just the opposite to my gloomy expectations. I found a wonderfully good show, numbering about a thousand entries; instead of one tent nearly empty, two crowded with birds, a half-open side tent or stand for other classes of poultry, and a number of picturesque, bazaar-like, half-open alcoves or bowers full of cage birds. But more than all, and beyond all, the Show was thronged with visitors—so much so that it was

difficult to see the birds. Only at Birmingham have I ever seen a show so crowded. Certainly Bath Show was a great success, and the difference between the attendance at Bristol was most striking. I will speak first of the poultry, then of the Pigeons; and lastly make a few suggestions as to avoiding some faults, pardonable in a first show, but easily to be noticed by one who sees a great number of shows, and as easily to be avoided by the Committee in future.

POULTRY.—The adult *Dorkings* were much out of condition and only moderate in quality. The coloured cock and hen class but three pens. The cockerels were not so good as the pullets, which may be pronounced a very good class. In the other Dorking classes the pullets were again the best. First and second to Silver Greys, third to Whites.

Our old friends the *Cochins* made a wonderfully good stand, and proved that what people in common so often say is not true—viz., that they are almost extinct, for upwards of fifty pens appeared. First-prize Buffs were fair only. The White Cochins were the best of all. Cochin pullets were better than cockerels.

However, the *Brahmas* carried all before them as a class; while the first-prize Dark cockerel, No. 36, belonging to Mr. Lingwood, was the most wonderful chicken that I or perhaps any other fancier ever saw. If such the cockerel, what will the cock be? I heard one of the oldest fanciers present only "wishing that his ship had come in," and that he could buy him. Old Brahmas were not so good as the young. The Light Brahmas were even more numerous than the Dark, but the old birds in bad feather. The pullets, as in Dorkings and Cochins, were the best; indeed, the young ladies at Bath were superior to their elders of both sexes.

The *Game* were but few, and hardly up to the mark save in respect of the winning pens, and Mr. Matthews's pullet the best of all.

The *Hamburghs*, on the contrary, were both numerous and good, showing that south and west-country exhibitions no longer lack these beautiful classes to gladden the eyes of visitors. There were even classes for Black Hamburghs, both old and young birds.

The *Spanish*, although Bath is near Bristol, mustered but fifteen pens. Mr. Edward Jones of Bristol, as usual, was a chief winner. It was the belief of some that in regard to the pullets the first and second prizes ought to have been reversed.

To show how eccentrics take the fancy of Englishmen I will notice that *Silkie*, fowls not only without beauty, but which are positively ugly—ugly through sooty skin to black bone, actually numbered twenty pens. Of course this is a mere passing fancy. Mere curiosities should never become numerous.

The *Houdans* were by no means bad—yea, very good; and the *Polish*, what there were, were good, particularly the *Silvers*; Golds not their equals. Among the Any variety class were some very good *Malay* chickens (pullets).

The *Game Bantams* were not so good as we have frequently seen them; but there was a good pair of Silver Sebrights of the revived silver, not the pale cream colour, and there was also a good pen of White Bantams.

The *Selling* class, seldom much to look at, was numerous and various in merit. *Spanish* hens with painted combs must be mentioned, though I would much rather not have seen them, and dislike having to publish their exhibition.

PIGEONS were very numerous—over two hundred pens, and among them some beautiful birds. The first-prize *Carrier* was a good long-feathered bird with a good head both in eye and wattle. Second a *Dun*, but moulting; indeed, the *Carriers* and many other varieties were in bad feather. The hens were superior to the cocks, and one took the cup. The *Pouters*, really a good many; the first-prize cock not a good colour, but honestly shown; second much in moult. Hens, the first Black, second Blue, and a long bird. The *Barbs* were admirable, and the best two pens were—an unusual thing—declared to be of equal merit. In *Tumblers* all the prizes went, and deservedly, to *Almonds*. *Dragoons* are certainly improving, and I greatly hope this fine old variety will have entries as large as that new and much inferior bird the *Show Antwerp*. The *Dragon* is a gentleman of long lineage—the *Show Antwerp* mere "shoddy." The useful *Antwerp* stands on the excellent basis of utility, and is a deserving bird. In the *Antwerp* class the prizes went to the shorter-faced variety. The *Owls* were very excellent, and the first and cup *Africans* perfect gems. *Nuns*.—Red-headed birds first. *Turbits* numerous, so also *Fantails*, and the hen of the first-prize pen graceful in the extreme, the quality imparted to her by her Scotch blood. I must notice the excellent first-prize *Jacobins*, whose closely-fitting hood marked them as superior. *Trumpeters* only two pens! The Any variety class showed some specimens of quaint varieties not often seen.

I must just go back to the poultry to notice the Local classes, not numerous, but containing some excellent birds. The first-prize *Light Brahma* chickens were very good indeed, and belonged to Messrs. Smith of Bath. A good pair of *White Cochin* chickens took second, belonging to R. v. T. L. Sprye of Newton St. Loe, near Bath, while a widely-known and veteran fancier

ST. NEOTS POULTRY SHOW.

If it had not been for the rain, which fell in torrents for several hours during the early part of the day, this Show would no doubt have been a thorough success, for the competition in almost all the classes was very good, and in some really severe. The Show, which was that of the Huntingdonshire Agricultural Society, was held in two good tents, and we believe the birds were attended to with great care. The entries were far in excess of those of last year. Turner's pens were used, and showed the birds well. Mr. Tegetmeier was the Judge, and we think his awards were generally correct.

Dorkings had four classes, and the cup for this breed was won by a capital pair, now pretty well known. All the Dorking classes were good, and the competition, excepting in the Silver-Grey, was brisk. The first-prize pair of Buff *Cochins* was fortunate in winning also the Cochin cup and the special prize offered by the Duke of Manchester for the best pen of fowls in the Show. They were a very beautiful pair of chickens, good in all points; the pullet of very excellent colour, one of the best we have seen for some time past. Adult Partridge won both the prizes in the Variety Cochin class. In Dark *Brahmas* Mr. Crabtree's fine old birds were first, and a fine pair of chickens second. In Lights Mr. Lingwood was first with a capital pair of chickens. We liked Mrs. Peet's pen very much, and do not know whether they were not better than the second-prize birds. The pullet was particularly good in shape and colour. Mr. Lingwood's Dark cockerel won the Brahma cup. He is a truly magnificent bird. In *Game* the cup was won by a splendid young Duckwing, which bids fair to be one of the best seen of late. *Spanish* and *Hamburghs* were fair classes. In *Bantams* the first-prize Black Reds, winners also of the Bantam cup, Piles, and Silver-laced were very beautiful birds. In the Variety class capital Crèves and Golden Polands won first and second, whilst good Houdans and Leghorns were highly commended, and Golden Polands commended. In the Barndoor class there was nothing specially good.

The Aylesbury and Rouen *Duck* classes were truly wonderful. Several of the birds had to be weighed, and the competition in these classes, and also in the Variety Ducks, and in the *Turkeys* and *Geese*, was of the highest character. Ducks, Geese, and Turkeys had each a cup and a special prize given by the Duke of Manchester, so that that might account for the number of entries in these classes.

In *Pigeons* the competition was not so great. The *Carriers* succeeded in winning the Pigeon cup. They were good Blacks. *Pouters* were—first Blues, second Whites, and both good, though perhaps they might have changed places. The prize *Tumblers* were Almonds, and the *Fantails* both Whites of merit. In the Variety class first were Owls, and the second were Runts.

DORKINGS.—*Coloured*.—1 and Cup, J. Walker, Rochdale. 2, T. C. Burnell, Micheldever. *he*, R. Wood, Clapton, Thrapston. *c*, W. J. Russell, Norwood Junction; S. W. Hallam, Whitwick. *Silver-Grey*.—1, O. E. Cresswell, Farley Wood, Bagshot. *Any variety*.—*Cock*.—1, R. Wood. *he*, F. Parlett, Gallywood, Great Baddow. *c*, E. Winwood, Worcester. *Hens*.—1, R. Wood. *he*, T. C. Burnell; O. E. Cresswell.

COCHIN-CHINA.—*Cinnamon or Buff*.—1 and Cup, W. H. Crabtree, Levenshulme, Manchester. 2, W. H. Crabtree. *c*, H. Yardley, Birmingham. *Any variety*.—1, T. M. Derry, Gadeby. 2, W. H. Crabtree. *he*, R. S. S. Woodgate, Penbury, Tonbridge Wells.

BRAHMAS.—*Dark*.—1 and *he*, W. H. Crabtree. 2, H. Lingwood, Creeping, Needham Market. *c*, H. Wyman, Peterborough; E. Fritchard, Tettenhall, Wolverhampton; J. Watts, King's Heath, Birmingham. *Light*.—1, H. Lingwood. 2, P. Haines, Palgrave, Diss. *he*, Mrs. Peet, Charnbrook; S. W. Hallam, Whitwick. *Any colour*.—*Cock*.—1 and Cup, H. Lingwood. *he*, W. R. Garner, Dyke, Bourne. *c*, Mrs. Fryer, Gamton, Fuddoche, Newmarket.
GAME.—*Black-breasted or other Reds*.—1, E. Winwood. 2, G. H. Fitzherbert, Sevenoaks. *Any other variety*.—1, G. H. Fitzherbert. 2, Deacon, Oundle. *c*, E. Winwood. *Any variety*.—*Cock*.—1 and Cup, H. E. Martin, Southorpe, Fakenham. 2, E. Winwood. *he*, G. Beattley, Rickmansworth.

SPANISH.—1, W. Nottage, Northampton. 2, E. Winwood.
HAMBURGH.—*Gold and silver spangled*.—1, S. W. Hallam. 2, J. Gnan, Coalville, Leicester. *Gold and silver pencilled*.—1, J. Ward, Endon Hall, Ashby-de-la-Zouch. 2, H. Hume, Huntingdon. *he*, A. F. Faulkner, Thrapston.

GAME BANTAMS.—*Black-breasted or other Reds*.—1 and Cup, J. Walker, Frickney, Boston. 2, R. Wiggfield, Worcester. *he*, R. Wood; J. Mayo, Gloucester. *Any other variety*.—1, G. Evans, Worcester. 2, J. Pearce, Ely. *he*, J. Long, London. *he*, J. Mayo.

BANTAMS.—*Any other variety*.—1, M. Leno, Markyate Street, Dunstable. 2, R. H. Ashton, Mottram, Manchester. *he*, Duke of Manchester, Kimbolton Castle.

ANY OTHER VARIETY.—1, W. Cutlack, jun., Littleport, Ely (Crested Geans). 2, J. W. Boothby, Louth (Golden Pheasant). *he*, Holme, Huntingdon (Houdans). W. Dring, Faversham (Houdans); J. K. Fowler, Aylesbury. *c*, J. Goodliff, Huntingdon (Pohsb).

BARNDOR OR CROSSBREED.—1, W. Collett, sen., Abbots Ripton. 2, J. Watts. **SELLING CLASS**.—1, Mrs. Peet, Sharnbrook. 2, W. Dring, Faversham (Houdans). *c*, A. F. Faulkner, Thrapston (White Cochins).
DUCKS.—*Aylesbury*.—1 and Cup, J. K. Fowler, Aylesbury. 2, J. Walker, Rochdale. *he*, T. Sear, Aylesbury; T. Kingsby, Barcroft, Tring; T. Gannell, Milton; J. K. Fowler. *he*, J. Walker; — Deacon, Oundle. *Rouen*.—1, J. Walker. 2, R. Wood. *he*, J. Walker; F. Parlett; R. Wood; T. F. Upsher, Sutton, Ely; W. H. Crabtree; Hon Mrs. Vernon, Kettering; J. K. Fowler. *Any other variety*.—1, J. W. Kellaway. 2, M. Leno. *he*, M. Leno; J. Walker; J. Goodliff; G. H. Mellor; — Wady. *c*, R. Wood.
TURKEYS.—*Cup Special*, 1 and Mrs. A. Mayhew. 2, E. Kendrick, jun. *he*, M. Kew; T. Gannell; Rev. N. J. Ridley. *he*, D. Herbert.
GEESSE.—*Cup and Spec*, J. K. Fowler. 2, J. Walker. *he*, Capt. Anyon. H. Wymao; Duke of Manchester; Thurnham Bros.

PIGEONS.

CARRIERS.—1, Cup, and *he*, — Mison, St. Ives. 2, W. Nottage, Northampton. **POTTERS**.—1, P. R. Spencer, Hereford. 2, A. Storrar, Peterborough. *he*, E. C. Stretch, Ormskirk.

TUMBLERS.—1, A. A. Vander Meersch, Tooting, London. 2, H. Yardley. **FANTAILS**.—1, — Loversidge, Newark. 2, H. Yardley. **ANTWERPS**.—1, H. Yardley. 2, Mrs. H. Cox, Smethwick, Birmingham; A. R. Barnell, Cambridge.

ANY OTHER DISTINCT BREED.—1, L. Allen, London (African Owls). 2, J. S. Price, Finchley (Blue Runt). *he*, A. A. Vander Meersch. *c*, H. Yardley; E. Hills, Chatters (Kunt); J. S. Price (Florentines); J. W. P. James, Hereford.

JUDGE.—Mr. Tegetmeier, London.

THE POULTRY-KEEPER.—No. 19. COCHIN-CHINA OR SHANGHAI.

BUFF COCK.—GENERAL CHARACTERISTICS.

Body (see fig. 79) massive and compact, short, cubic, short-legged; weight and size considerable; head of ordinary dimen-

Fig. 79.—Cochin-China Cock.

sions; comb single, straight, and toothed; neck rather slender; shoulders projecting; wings short and raised; back flat and horizontal; breastbone projecting; thighs and legs very strong; feet short and strong; flesh of the breast not in proportion to the fowl's size; plumage buff, abundant, especially on the thighs and abdomen; feathers of the tail very short; the shank of leg short and feathered; flesh of a well-fed chicken of six or eight months very good, poor when full-grown, more abundant, but not so good on the thighs and legs as on the wings or breast; fattens fairly well, but not selected for cooking; bones heavy.

Weight.—From 8½ to 11 lbs.

Stature.—From the upper part of the head to under the feet 23½ to 27½ inches.

Body.—Circumference taken in the middle under the wings close to the thigh joints, 17½ inches.

Length of Body.—From the beginning of the neck to the rump 11 inches.

Breadth of Shoulder, 8½ inches.

The body of the Cochins-China is as if composed of cubic parts. The shoulders are extremely projecting and angular, forming with the back and wings, which are raised to the level of the back, a large, flat, horizontal surface. The breast is high and large. The feathers of the sides much flattened, and joining in two large layers, showing fully the prominence of the breast. The wings are short and nearly hidden by the long feathers, which, however, do not come down much further. The upper part of the cock is covered with short and flowing feathers, which do not conceal the form of the limbs they cover. This upper part presents a great contrast to the thighs, which are enveloped with long light down, spread out and forming with the end of the rump an excessive mass of feathers, but which constitute the most striking characteristics of this variety. The shanks are slightly hidden under the thigh feathers, and you can hardly see where they join to the foot.

Head.—Length, 3½ inches.

Cheeks.—Bare and feathered at the back of the auditory organ.

Comb.—Single, short, straight, and toothed with six or seven large teeth; very thick, particularly at the base, which nearly covers the space between the eyes; not very long behind, and extending in front of the nostrils.

Wattles.—Medium length and rounded.

Ears.—Short, 1½ inch.

Tufts.—Very thick, and formed of yellow feathers like hair.

Nostrils.—Ordinary, longitudinal.

Beak.—Strong, rather straight, and of a good fresh yellow.

Eye.—Mild, and covered by a rather thick eyelid; pupil red; iris black.

Shank of Leg.—Length, 4 inches at the most; circumference, 2½ inches to 3½ inches. It should be very thick and very short, which constitutes one of the principal characteristics of the variety.

Toes.—Very strong; those in the middle longer, and the outside toe shorter, than that of any indigenous variety. The middle toe is nearly 4 inches long; the back toe is of ordinary size. The claws are strong, flattened, and long. Three rows of very soft feathers, but often reddish, are on the outside of the shank and of the little toe, and sometimes of the middle toe. They should be as long at the bottom as at the top of the shank and over the toes.

Colour of the Shank.—Citron yellow, pure in front, and behind of a more or less deep red, dotted with bright red. The toes are yellow.

Carriage.—Heavy, quiet, and awkward.

Crow.—Loud and penetrating.

Plumage.—The whole plumage should be a bright clear buff. The hackle on the shoulders and the lance-shaped feathers of a slightly golden hue occur in the purest breeds. The large and small sickles, which are extremely short, 4 to about 6 inches, are generally of a dark iridescent violet. The eyebrows at the base of the comb are garished with fine feathers, thin and bristling, more like hair than feathers. The hackle is loose and short. The feathers of the wings are flattened, showing the angular shape of the limbs, and consequently the expansion of the feathers of the thighs and abdomen, which are not so abundant in any other variety. The Buff should not have the least trace of white in the plumage, and black, or rather violet, should only appear on the tail. The Buff cocks have often feathers tipped with black beneath, especially between the shoulders under the hackle; those which are least thus marked are preferable.

RICHMONDSHIRE POULTRY SHOW.

The sixth annual Show of the Richmondshire Agricultural Society was held on the 10th inst. in the park of Sir Henry B. Pierce, Bart., of Bedale Hall. A better and more beautiful site could not have been fixed upon. The weather was not all that could have been wished for, as the early part of the day was wet, and during the whole of the day the wind was very strong, which was a serious drawback to the comfort of the poultry.

The special prize, the gift of Lady Bolton, was won by Lady Adelaide Beresford Pierce with a grand pen of Dorkings; the pullet decidedly the best out this season, and, if well matched, would be very likely to figure at Birmingham or any other of our large shows. The *Game* class came first, all shown together, the two winning pens both very good Brown Reds; but with the exception of a pen of Brown Red chickens, all the rest were only of little merit. The *Dorkings* was a good class, particularly the prize pens. The *Brahmas* were a large class. The first a capital pen of Dark chickens, well feathered, and a good colour; the second old birds, very good, but showing signs of moult. The class numbered seventeen pens, the largest class in the Show. The *Cochin* chickens were good, but only a small entry. There were only seven pens of *Hamburghs* shown, all the varieties in one class. First went to good Gold-spangles, second Gold-pencilled. The *Spanish* were not up to the mark in

quality. In Any other variety first went to Hondans, second to Silver Polands, Malays and Crêves highly commended. In *Bantams* eleven pens were shown, all breeds together. First went to Silver-laced, a good colour, but not clear in the lacing; second Black Red Game, and two pens highly commended. — In *Rouen Ducks* there were eight pens, the winners very good-coloured birds, and heavy weights; two pens were highly commended. The *Aylesburys* were fair average size and good in bills. In the Variety class first was Carolinas, second good White Call, and East India highly commended.

GAME.—1, W. Bearpark, Ainderby Stickle. 2, G. Carter, Bedale.

DORKINGS.—1 and Special Prize, Laay A. B. Pierce, Bedale. 2, J. White, Warlaby, Northalerton.

BRAHMAS.—1 and 2, Lady A. B. Pierce. *hc.* E. O. Poulett, Wensley Rectory (3); T. P. Carver, Laogthorpe, Boroughbridge; Hon. W. O. Powlett, Leyburn.

COCHINS.—1, H. Storey, Nottingham. 2, Lady Bolton, Leyburn. *hc.* R. Bell, Caldwell, Darlington.

HAMBURGHS.—1, T. P. Carver. 2, Sherwin & Wells, Ripon.

SPANISH.—Black.—1, G. Pounder, Kirbymoorside. 2, H. Dale, Northalerton.

ANY OTHER VARIETY.—1, T. P. Carver. 2, W. Bearpark. *hc.* E. J. Jaques, Richmond; R. Bell, Caldwell, Darlington.

BANTAMS.—1, T. P. Carver. 2, Miss E. M. Ellerby, Easingwold. *hc.* Lady A. B. Pierce. 3, T. P. Carver.

DUCKS.—*Rouen.*—1, T. P. Carver. 2, G. Pounder. *hc.* J. White, Warlaby, Northalerton; 1, Ineson, Bedale. *Aylesbury.*—1, T. P. Carver. 2, J. Smith.

Any variety.—1 and *hc.* T. P. Carver. 2, Col. Cathcart, Spananthorpe, Bedale.

GEES.—1, Messrs. Dovenor, Bedale. 2, G. Pounder.

TURKEYS.—1, T. J. Carver. 2, J. Graves, Fivby, Bedale.

EXTRA CLASS.—*hc.* E. J. Jaques (Crève-Cœur).

Mr. James Dixon, North Park, Bradford, was the Judge.

WOLSHINGHAM POULTRY SHOW.

This Show was held on Tuesday the 8th inst., in a field a little out of the village. Considerable spirit and interest were displayed by the Secretary and several members of the Committee, and there is little doubt but with proper direction this will become an excellent Show. In this case the poultry were a section of the whole of the annual Agricultural Show, and a very good marquee was considerably provided for the birds; the pens being on Turner's principle, but the property of the Frosterley Society, and were well arranged round the tent. The Show was divided into old birds and chickens, but there was not a class for either *Cochins* or *Brahmas*, which we consider a marked mistake. *Geese* were first on the list; the first prize pen, which were *White Embdens*, were really good. In *Ducks*, *Aylesbury* were first; and *Widgeon* second; *Rouens* being *nc.* *Turkeys* were a very good lot; but *Dorkings*, except the winners, poor; and *Spanish* but moderate. The entries were not numerous in *Hamburghs*, and the quality only low. In *Game* the whole were worthless, except the first-prize *Duckwings*, the cock in which pen was very rich in colour, and almost through the moult. Of *Polands*, good *Golden* were first; and *White-crested* second. In *Bantams* the first were *Black Reds*; and second *Blacks* in deep moult. In the Variety class a very correct pair of *Hondans* and *White Cochins* second. The class of *Guinea Fowls* was very good. In *chickens* the *Dorkings* were well-grown; but the *Spanish* wretched; while the two classes of *Hamburghs* were good. In *Golden*, first were *Spangles*, and second *Pencils*; and in *Silvers* both were *Spangles*. In *Game* the first were a grand-coloured pair of *Black-breasted Reds*, full of style and quality; and the second good *Duckwings*. *Polands* poor; but *Bantams* good, the winners *Black Reds*. *Ducklings* were a capital class; and the winners in young *Turkeys* very large and heavy in bone. In the class for three chickens of any breed, the first were a very good pen of *Crève-Cœur*; and second *Dorkings*.

One class was provided for *PIGEONS*—viz., pens of three pairs of different varieties, and some good sets were shown.

GEES.—1, J. Vickers, Frosterley. 2 and *hc.* W. Love, Redgate.

DUCKS.—1, W. Canney, Bishop Auckland. 2, Rev. J. G. Milner, Hamsterley. *hc.* J. T. Proud, Banchester.

TURKEYS.—1, J. T. Proud. 2, Mrs. Sanderson.

DORKINGS.—1, C. Widdas. 2, J. T. Proud. *hc.* Currah, Woodcroft.

SPANISH.—1, W. Jophing, Frosterley. 2, J. Pickard, Wolsingham. 3, H. Liddle, Wolsingham. *hc.* T. Fintoff, Newby, Stockton-on-Tees.

HAMBURGHS.—*Golden-spangled.*—1, R. Keenleyside, Aycliffe. 2, J. Forster, Hedley Hope. *Silver-spangled or Pencilled.*—1, T. Grey, Greenhead, Stanhope. 2, W. Canney, Bishop Auckland. *Silver-pencilled.*—1, M. Ridley, Peakfield. 2, J. Jackson, Hedley Hope.

GAME.—1, Joseph Gibson, Stanhope. 2, John Gibson.

POLANDS.—1 and 2, J. T. Proud.

BANTAMS.—1, A. M. Balmer, Bishop Auckland. 2, W. Canney. *hc.* J. Hopper. *c.* W. Grey, Tow Law.

ANY OTHER BREED.—2, A. Widdas, Witton-le-Wear.

GUINEA FOWLS.—1, W. H. Young, Driffield. 2, J. Gibson, Stanhope. *hc.* Mrs. Sanderson.

CHICKENS.

DORKINGS.—1 and 2, C. Widdas. *hc.* J. Chentham, jnr., Wolsingham. *c.* W. Love, Redgate.

SPANISH.—1, A. M. Balmer. 2, W. Jophing. *hc.* Ridley, Frosterley.

HAMBURGHS.—*Golden-spangled or Pencilled.*—1, R. Keenleyside. 2, W. Jophing. *Silver-spangled or Pencilled.*—1, W. Jophing. 2, J. Forster. *hc.* J. Forster. *c.* Finlay.

GAME.—2, J. Waller, Stanhope. *hc.* J. Waller; W. Younghusband, Darlington.

POLANDS.—1 and 2, W. D. Maddison, Sunnyside.

BANTAMS.—1, W. Canney. 2, W. Grey. *hc.* A. M. Balmer.

ANY BREED.—1, C. H. Shaw, Wolsingham. 2, S. & W. Coulson, Redgate. *hc.* C. Widdas. 2, A. Pickard.

GOULINGS.—1, J. Bewley. 2, H. Forrest, Durham. *hc.* W. Canney; J. Bewley. *DORKINGS.*—1, W. Simpson. 2, W. Canney. *hc.* Mrs. Lonsdale, Wolsingham; J. T. Proud.

TURKEYS.—1 and 2, J. T. Proud. *hc.* Mrs. J. Vart.

PIGEONS.—1, G. Trueman, Bishop Auckland. 2, S. & W. Conlon, *hc*, J. Robinson, *unsmide*; J. Stephenson, Wolsingham; J. Young, Bishop Auckland. c, J. Robinson.

The Judge was Mr. E. Hutton.

TAMWORTH POULTRY SHOW.

FORTUNATELY for the owners of a very valuable collection of poultry, the Managers of the Tamworth Poultry Show were not only persons of unquestionable experience in such matters, but were also anxious to bring to bear every appliance likely to promote the comfort and safety of the exhibition stock entrusted to them. Had it not been for these careful arrangements, there cannot be much doubt that a very large proportion of the fowls shown would have been irreparably injured as show stock, and equally so as brood stock, by the terrific downpour of rain which prevailed throughout the greater portion of the day the Show was open for public inspection. With the precaution of an excellent tent, the show pens of Messrs. Turner of Sheffield, and the most diligent attention to the birds as to feeding, &c., the Show caused a feeling of comfort, contrasting strongly with the complete saturation of everything that was to be seen by visitors on all sides before their obtaining shelter. We trust other committees will follow the plans just named, and thus tend to increase the confidence of exhibitors as to the general treatment of poultry, which in every case must have been raised with considerable trouble, or purchased at prices that should induce committees to afford them during their stay all the care and attention in their power. In the general chill of such a damp atmosphere as prevailed, of course poultry could not be expected to look to the same advantage as under more congenial circumstances; besides, it was a chicken show throughout, and a goodly number of these youngsters were so young as to be in deep moult, and consequently were less disposed to look cheerful under trying circumstances.

Game chickens were good, and this remark applies to Black Reds, Brown Reds, Red Pileas, and Duckwings. Only two pens of *Spanish* fowls were shown, but both were very good. *Dorkings* were remarkably fine, and the *Cochins* were of high merit also, more particularly the Partridge-feathered and White ones. Some trimmed hocks were discovered in otherwise good birds, and passed by without any advantage being gained as to prize-taking by this attempted injustice to other exhibitors. *Brahmas* were of very good quality throughout large classes; and though the *Hamburgh* classes were not extensive, nearly every pen was such as is not commonly to be met with. *Houdans* and *Crève-Cœurs* were both superior classes, and the matching as to feather of the former was far superior in the majority of pens to what is usual, as of late not a few pullets have been exhibited all but entirely black, giving at first sight a strong impression to the minds of visitors of a large but inferior Black Poland, scarcely carrying a dozen white feathers on the whole bird. Both *Aylesbury* and *Rouen Ducks* were exceedingly fine, the latter proving extraordinarily true in both ground colour and markings. In the Variety Duck class there was indeed a "variety," and composed too of the very best of specimens, Vidua Whistling Ducks and Chiliana taking the lead, very closely pressed by East Indian Ducks, some of the best White Call Ducks exhibited for a long time past, and the other variety of Whistling Ducks. Gold-laced Bantams and Black Hamburgs took the prizes in the Extra class.

GAME.—Black-breasted and other Reds.—Chickens—1, G. Bagnall, Draycot, Stoke-on-Trent. 2, W. T. Eversard, Ashby de la Zouch. *hc*, T. P. Lyon, Laverpool. Any other variety.—Chickens—1, J. Mason, St. John's, Worcester. 2, Duke of Sutherland, Stoke-on-Trent.

SPANISH.—Chickens—1, E. Winwood, Worcester. 2, H. Wilkinson, Earby, Skipton.

DORKINGS.—Coloured except Silver-Gray.—Chickens—1 and 2, Mrs. F. S. Arkwright, Sutton Semdale, Chesterfield. *hc*, Rev. E. Kartrum, Ferhamstead; Mrs. M. Murray, Thunston, Derby. Silver-Gray or White.—Chickens—1, O. E. Cresswell, Early Wood, Bagshot. 2, Miss Williams, Henlys, Bournemouth. *hc*, Hon. Mrs. K. S. Colville, Lutington, Lutton-on-Trent.

C. CHINESE.—Cinnamon or Buff.—Chickens—1, C. Sidgwick, Keighley. 2, J. Watts, King's Heath, Birmingham. Brown, Partridge-feathered.—Chickens—1, R. S. Woodgate, Pembury, Tunbridge Wells. 2, C. Sidgwick. *hc*, T. Sheppard, Humberstone (2). c, E. Kendrick, jun., Lichfield.

BRAMA POOTHA.—Duck.—Chickens—1, B. Kendrick, jun., 2, Horace Lingwood, Cretingham, Needham Market. *hc*, W. J. Jervis, Finner; T. F. Ansdell, Cowley Mount, St. Helens; J. Watts. Light.—Chickens—1, H. Chawner, jun., Hounslow, Uxbridge. 2, T. A. Dean, Marden. *hc*, J. T. Ducks, Humberstone; F. Holbrook, Highfields, Derby.

HAMBURG.—Golden-pencilled.—Chickens—1 and 2, Duke of Sutherland, *hc*, A. F. Faulkner, Thrapstone. Silver-pencilled.—Chickens—1 and 2, Duke of Sutherland. *hc*, J. Long, Bramley; A. F. Faulkner.

HAMBURG.—Gold-laced.—Chickens—1 and 2, Duke of Sutherland. *hc*, T. May, Wolverhampton. Silver-pencilled.—Chickens—1 and 2, Duke of Sutherland. *hc*, G. L. W. Whately, Tamworth.

HORNBILLS.—Chickens—1, G. W. Hubbard, Goulley, Hyde, Manchester. 2, R. B. Wood, Uxbridge. *hc*, W. Daring Faversham. c, Mayon, Fazeley, Tamworth.

CREVE-CŒUR.—1 and 2, R. B. Wood. c, W. Daring.

TRUMPETS.—1, E. Kendrick, jun., Lichfield. 2, F. E. Richardson, Bramshall, Uxbridge.

GESE.—1, Hon. Mrs. K. S. Colville. 2, W. H. Crewe, Etwell, Derby. *hc*, Duke of Sutherland.

DUCKS.—Hute Aylesbury.—1, T. Sear, Aylesbury. 2, W. H. Crewe. *hc*, Rev. G. R. Early, Bladely, Newcastle. Duke of Sutherland. *hc*, Duke of Sutherland. 2, R. Kendrick, jun. *hc*, G. W. Chell, Stone. Any other distinct variety.—1 and 2, M. I. Cho, Marygate Street, Dunstable (Vidua Whistlers and Chinese Pintails). *hc*, Mrs. F. S. Arkwright (Whistlers); E. Kendrick, jun. (East Indian); Duke of Sutherland (White Call); H. Chawner, jun. (Black Cayuga).

EXTRA CLASS.—Chickens—1, Duke of Sutherland (Black Hamburgs). 2, M. Leno (Gold Laced Bantams).

Mr. Edward Hewitt, of Eden Cottage, Sparkbrook, near Birmingham, awarded the prizes.

NEWPORT (SALOP) POULTRY EXHIBITION.

FOR many years past the North Shropshire Agricultural Society has combined a show of poultry with its annual exhibits, and the arrangements having been uniformly good, few shows have progressed with greater regularity than the one in question. The weather was fortunately most propitious, and the attendance of visitors was larger than on any prior occasion. The appearance of the tent on entering was prepossessing, and the care taken of the poultry could not have been surpassed. A two-guinea silver cup, given for the best *Game* cock of any age or colour, brought out a very unsatisfactory competition; the adult birds being in the worst of feather from deep moult, and the chickens were quite immature. A really good Brown Red shown by his Grace the Duke of Sutherland was the winner, but sent in a state of plumage anything but fit for exhibition. In a class for pairs of Black or Brown Red *Game* chickens, his Grace again headed the prize list with a grand cockerel, exceeding fine in colour, and sent in the most perfect plumage, Mr. T. Haseall of Market Drayton taking second prize with a very fine pair of Brown Reds. Red Pileas secured both the prizes for Any other variety of *Game*. The Grey *Dorkings* were fine birds. In a general *Brahma* class a pen of Light-feathered ones were first; and Dark ones took the second prize. *Hamburghs* were most exceedingly good classes, and here the Duke of Sutherland was successful with specimens of extraordinary quality, and of every variety. Some very superior pens of *Hamburghs* were competing that from overshooting combined with neglect were quite unfitted for the wear and tear of constitution ever resulting from incessant travelling and excitement. In the Selling class Dark and Light *Brahmas* were the prize-takers, both good, and being restricted in price to 30s. the pen they soon changed ownership. *Aylesbury Ducks* were most excellent, and the *Rouens* were fully equal to them. *Geese* and *Turkeys* were superior classes. In the *Cochins*, the Partridge-feathered were fine, and the pullets of that perfect pencilling so difficult to meet with in the present day, but which was so striking a feature of Partridge *Cochins* in the days when the Punched strain were so notorious.

In Pigeons, the Variety class was a very interesting one, the prizes being taken by Fire Pigeons in exquisite feather; and a pen of Burmese Pigeons, quite a new variety, and one that from their very peculiar markings were much admired.

In the class for Any variety of fowls not included in the foregoing classes, the Rev. A. G. Brooke won with his well known pen of Malays, closely pressed, however, by a pen of Black *Hamburghs*, the property of the Duke of Sutherland. Even in the largest of shows it would be difficult to find two pens their equals.

On an ornamental water near the entrance to the Show, three couples of Ducks, which were literally Fancy Waterfowls, enlisted a great amount of public attention; in fact, it was almost impossible to get near the pond from the crowds by which it was constantly surrounded. It appears a trio of young ladies had subjected these six Ducks to the effects of Judson's dyes, and the extraordinary hues of these birds was only equalled by the singularity of the disposition of their gay colours. One sported a blue head on a body of deep orange, another a mixture of crimson and mauve, whilst others had all the gay costume of a clown or pantaloon. It was laughable in the extreme when, from among the weeds, first one and then another of these eccentricities became visible, how much the bystanders became interested; and whilst inquiries were rife enough as to what breed they could be, the climax of the joke was attained by several parties wanting to know if eggs from those beautiful Ducks were procurable. Alas! like many other things in this world, it was all outside show; but it was remarkable that even after these Ducks had washed themselves *ad libitum*, the colours seemed to be as fast as at the outset. It would be interesting to know whether this dye will prove as permanent as it appears likely to be, and we cannot but congratulate the fair operators not only on the success of the experiment to enlist public curiosity, but also on the variety of the hues and disposition of the colours on these gaudy and remarkable impostures. Surely, to draw a company, they might be lent on hire beneficially equally as show pens; though no doubt distance softened down irregularities that might have been offensive on too near an inspection.

GAME.—Cock.—Cup, Duke of Sutherland, Trentham Hall. Black or Brown Red.—1, Duke of Sutherland. 2, T. Hassall, Market Drayton. *hc*, J. Chesters, Nantwich. Any other variety.—1, G. Lurt Market Drayton. 2, Duke of Sutherland.

BANTAMS.—1, H. Yardley, Birmingham. 2, Duke of Sutherland.

DORKINGS.—1 and 2, C. D. Hudson, Market Drayton.

BRAHMAS.—1, Mrs. S. Cotes, Cheshambury. 2, Duke of Sutherland. *hc*, J. Boune, Donnington Barracks; W. Baker, Etches, Broughall. c, J. H. Kemp, Market Drayton.

COCHINS.—1 and 2, J. G. Pearson, Market Drayton. *hc*, H. Yardley.

HAMBURGERS—*Gold or Silver-spangled*.—1 and 2, Duke of Sutherland. *Gold or Silver-pencilled*.—1 and 2, Duke of Sutherland, *hc*, J. Long, Bromley Common, *c*, F. W. Meynell, Verby.

ANY OTHER VARIETY.—1, Rev. A. G. Brooke, Shrawardine, Shrewsbury. 2, Duke of Sutherland.

SELLING CLASS.—1, Worrall, Lilleshall, Newport (Brahmas). 2, J. Bourne (Brahmas). *hc*, Mrs. E. Williams Penilly, Berwick (Dorkings). *hc*, J. Wheeler (Eagles).

HEAVY-T.—1, J. Bourne (Brahmas). 2, S. Podmore, Horton's Wood, Wellington (Brahm as).

DUCES.—*Aylesbury*.—1, J. Wheeler, Long Compton, Shipston-on-Stour. 2, Duke of Sutherland. *hc*, E. Shaw, Hiss Willmot, Oswestry. *Any other variety*.—1, Duke of Sutherland. 2, E. Shaw (Roman). *hc*, C. D. Hudson (Carolina). *c*, J. Wheeler (Eagles).

GESE.—1, W. B. Etches. 2, Duke of Sutherland. *hc*, G. Holland, Stockton; E. Shaw.

TURKEYS.—1, W. B. Etches. 2, Rev. W. B. Corfield.

PIGEONS—*Carriers*.—1 and 2, H. Yardley. *Any other variety*.—1 and 2, Rev. A. G. Brooke (Nuns and Burmeses). *hc*, H. Yardley (3); Duke of Sutherland (Archangels). *c*, K. H. Edleston, Newport (Black-mottled Tumblers).

The Arbitrator was Mr. Edward Hewitt, of Eden Cottage, Sparkbrook, near Birmingham.

ARMLEY AND WORTLEY POULTRY SHOW.

THIS was held on the 7th and 8th inst. We must defer our remarks until next week.

GAME.—1, H. Beldon, Goltstock Bingley. 2, J. Worsnop, Wortley. *hc*, W. Ellis, Newsum Green. *Cock*.—1, H. Beldon. 2, S. Kayner, Farnley.

BANTAMS.—1, H. Beldon. 2, J. Roberts, Bramley. *hc*, A. Wilkinson, Burley; W. Ellis.

HAMBURGERS—*Gold-pencilled or Spangled*.—1 and 2, H. Beldon. *Silver-pencilled or Spangled*.—1 and 2, H. Beldon. *Black*.—1 and 2, H. Beldon. *hc*, M. A. Hildsworth, Wortley.

POLANDS.—1 and 2, H. Beldon.

SPANISH.—1, H. Beldon. 2, J. Thresh, Bradford.

BRAHMA POOTRA.—2 and *hc*, H. Beldon.

COCHIN-CHINA.—1 and 2, H. Beldon.

ANY VARIETY.—1, H. Beldon. 2, Birk-borough & Hildsworth, Harrogate.

GESE.—*Dark*.—1, W. Howgate, Hunslet. 2, T. Rydal, Bramley. *Light*.—1, Mrs. J. Jackson, Armley.

DUCKS.—*Rouen*.—1 and 2, Parkinson & Marshall, Dewsbury. *hc*, G. R. Porritt, Farnley. *Aylesbury*.—1, G. R. Porritt.

GUINEA FOWLS.—2, J. W. Akeroyd, Armley.

PIGEONS.

CARRIERS.—1, J. E. Crofts, Blythe.

OWLS.—1, J. Thresh, Bradford. 2, H. Beldon.

TURBITS.—1, J. E. Crofts. 2, H. Beldon.

BARDS.—1, J. E. Crofts. 2, J. Thresh.

TUMBLERS.—1, J. E. Crofts. 2, H. Beldon.

FANTAILS.—1, J. E. Crofts. 2, Mrs. J. H. Hepper, Wortley.

JACOBIANS.—1, H. Beldon. 2, J. E. Crofts.

ANTWERPS.—1, W. Hildsworth. 2, H. Denison, Wortley.

ANY VARIETY.—2, J. E. Crofts. *hc*, J. Thresh.

CAGE BIRDS.

NORWICH.—1, J. Howden, Armley.

BELGIAN MAILED.—1, W. Applestan, Wortley.

YELLOW OR BUFF.—1, P. Beard, Farnley. 2, J. Atkinson, Holbeck.

LIZARD.—1, J. Howden. 2, W. Applestan.

MULES.—1, J. Howden. 2, F. Wild, Armley.

BULLFINCH.—1, J. Howden. 2, R. Robinson, Wortley.

GERMAN BIRD IN SONG.—1, R. Crosland, Low Wortley. 2, J. Howden.

CANARY.—*Any Breed*.—1, J. Howden. 2, J. Wilkinson, Wortley.

PARROTS.—*Grey*.—1, P. W. Norliffe, New Wortley. 2, W. Clogg, New Wortley. *Green, or any other variety*.—1, W. Hudson, Armley. 2, J. Whitaker.

RABBITS.—*Any Breed*.—1, S. Eall, Bradford; T. Myton, York. 2, G. S. Burton, Beeston. *Lap ear*.—1, T. Myton. 2, Adams & Mills, Bradford; G. S. Burton. *hc*, J. Wainman, Wortley.

OPEN TO WORTLEY AND ARMLEY.

CANARIES.—*Yellow English*.—1, T. Harrison, Wortley. 2, J. Howden. *hc*, W. Applestan. *Buff*.—1, Hepston, Wortley. 2, W. Clegg. *hc*, J. Howden.

MARKED.—1, W. Applestan. 2, R. Crosland. *Two Crested*.—1, R. Crosland. 2, S. Galloway, Armley.

VIARY.—1, W. Applestan. 2, R. Robinson.

JUDGES.—*Poultry*: Mr. J. Crosland, jun., Wakefield; Mr. J. Cannan, Bradford. *Birds*: Mr. W. Brownridge, Leeds.

THE ANNUAL ZOOLOGICAL SALE AT ANTWERP.

ANTWERP with its churches, shipping, pictures, and wood-carvings is known to many of us, but it is almost as well known for its Zoological Gardens, where each year at this time the unwearied and successful direction invites all comers to attend the public sale of its spare specimens, and has invariably a surprise in store for its visitors. Highly successful in acclimatisation and breeding, each successive introduction of Pheasants and Game birds has found its home in the little gardens at Antwerp.

Last week the auctioneer had a pleasing although a long and tedious task. On Tuesday and Wednesday birds, beasts, and reptiles under his hammer were adjudged to societies, amateurs, and dealers from all parts of Europe. Some idea of the variety of objects offered may be formed, when we say that the list comprised an elephant, giraffes, and lions, and ended with serpents and seals.

On Tuesday, soon after ten in the morning, the sale commenced with small foreign birds, which found ready purchasers at prices slightly in advance of those of our retail bird dealers. It was surprising to see the number of Java Sparrows and Bndrigars that found purchasers. Some of the earlier lots of White Java Sparrows brought long prices. Turquoisines, Cockateels, the different varieties of Cockatoos followed. One handsome Masked Parrot was a great bargain to the Gardens at Amsterdam, at £9; a pair of Black Cochins fowls that would not have been thought much of by us went at a good price to Berlin, as did a pen of very good adult Spanish. Silkies of indifferent quality sold well, as did Dorkings and Houdans. A pair of Blue-

checked Guinea Fowls made £4 4s.; a pair of Crowned ditto, 59. A pair of Argus Pheasants 2700f., and an unusually fine pair 3000f. A pair of Polyplectron Germanix, bred in the Gardens, made 1100f., one pair Chinquis 850f. These were bought for the Zoological Gardens of Cologne. One pair of Temmincks Tragopans brought for the same made 825f. One cock and two hens Vieillotii (the hens faulty), 110f. One pair of rare Pheasants, Dardigallus proclatus, made 1600f., for Paris; and a second pair 1400f., for Amsterdam. Dr. Evans became the possessor of a pair of Tragopans for 1450f. Reeves's Pheasants varied, good pairs making 300f. and 325f. Swinhoes 210f. One pair of the now scarce Gallus furcatus, bought by Mr. Baily of London for 150f., was resold for Paris. Curious among birds, but most amusing in their quaint waddling gait and comical expression of eye, were eight or nine Penguins. They stood in their enclosure and watched the proceedings narrowly, so tame that they would feed from the hand. Two fetched 450f., for Cologne; one 230f., for Berlin; one 223f., for Amsterdam. One pair of Bennett's Kangaroos in excellent condition was purchased for the Zoological Gardens at Frankfurt. The Cranes were very beautiful and in great variety, but the demand slow. A pair of Demoiselles made 300f. Black-necked Swans, Black Swans, and young Trumpeter Swans all found ready purchasers; as did the beautiful little Ducks, of which a great many were sold at good prices. But the choicest birds, with the exception of the Arcuata, were bought for Continental collections. The gems among the Ducks were one pair of Kasarka variegata, which made 325f.; one pair of small Teal, Querquedula formosa, 210f.; and one pair, said to be from the Cape, 280f. The different varieties of Whistling Ducks mustered in force and were in favour. One, the little Arcuata from India, is likely to become a favourite with us. Mandarin, Carolinas, Shell Ducks, and Shovelers made full prices. Some Bar-headed Geese made from 200f. to 240f. a pair. Gold and Silver Pheasants sold as usual; but some Chinese (a Collier), made great prices. Three young Bears made nearly £40; a Porcupine 150f.; Rhesus Monkey 35f.

The beautiful varieties of foreign Pigeons attracted great attention, and they made full prices on both days. The greatest attraction was a pair of Bleeding-heart Pigeons. These were bought by Messrs. Baily, of London, for 580f. The Nicobar Pigeon with its metallic plumage and hackled neck was much sought after for France, as it breeds well. There the price was about 130f. to 140f. per pair. The elegant Crested Lophotes about 75f. Some Blue Jacobins, 30f. to 45f. Montaubans, 60f. to 90f. An almost endless variety and sequence of little Doves, and plumage cage birds. Among them Whydahs, Cut-throats, Military Starlings, Cow-birds, Rice-birds, and Thrushes, from America. Scarlet and Blue Tanagers. Returning to larger things we may notice a new feature, one we suppose introduced by the Director in emulation of our English Short-horn sales. A Bull, two Cows, and four Calves, imported Short-horns, made 5600f. A Zebra, bought by Mr. Montgomery for Dublin, 1800f.; and a second, bought for Paris, 1560f. The young Elephants and Giraffes were put up but were bought in. Several pairs of Seals were sold at the apparently low price of 100f. and 120f. the pair.

The company was large from the beginning to the close of the sale, the arrangements good, and the conditions of the birds and animals wonderfully good. The Zoological Societies of all the principal cities of Europe (London excepted), were represented, and many amateur buyers from Italy, Paris, and Germany. Belgium and Holland were strongly supported. The principal buyers from England were Messrs. Jamrack, Baily, Montgomery, Castang, &c.

POUTERS, ANY OTHER COLOUR OR MARKING.

I HAVE read with close attention the correspondence on the above question. The discussion arose from Mr. Huie's article which appeared in the Journal of January of this year. That article is plain and practical, no "spinning of a yarn." We have repeatedly seen the work of the four gentlemen implicated in judging our most important shows, and have failed to perceive any decided difference in the proclivities of any of them. How, then, have they managed to disagree? The question appears to be, "How is a standard bird produced and maintained?" This can only be dealt with when we have solved the previous question of what a Pouter is. Mr. Huie, therefore, starts with, "It is neither colour nor marking, but shape, that constitutes the Pouter Pigeon." Mr. Ure coincides when he says, "Colour and marking do not make a Pouter, they only finish one." As no other has been put forward we are bound to infer that the definition has been found to be correct. That being so, Mr. Huie then proceeds to tell us from his own experience how best to produce and maintain the bird so defined; and let us here remark that anything that falls from the pen of such veteran breeders as Messrs. Huie and Ure on this subject should be received with deference by fanciers of less range and experience.

The foundation of Mr. Huie's breeding structure rests on "Pouters any other colour or marking," and for that reason, and the encouragement of poor fanciers, he advocates a class for

them. (We think, however, the title might be simplified to "Any other Pouter," as we do not see how mismarked birds can be consistently excluded from it, a White splashed with blue, and a Blue splashed with white being but Tom and Thomas). In pleading his case he makes a statement of facts based on his own experience, clearly proving the breeding utility of the class in question. These facts have not been denied or disproved, and we are bound to accept them as being correct. If Mr. Stuart had proceeded in the same way—first defined and then given us his experience in breeding the bird so defined, we could the more easily have understood him.

The position taken up by Mesers. Huie and Ure commends itself to us. We fancy how the makers of this variety set about their work. First the peculiarity of the breed—the globe, attracted attention; that was attained. Then the fine taper body and Belgian shoulder were found to suit it best, and the work was completed when set on the fine pedestal of the limbs. The indescribable grace known as "style," inherent in the most common Pigeon, became intensified in the transition as the bird acquired the perfect use of his more fully-developed organs. But our artists must needs go further, and following the instinct of all true art, they next proceeded to embellish their work. Then we got the uniform colour, with the moon to give decidedness to the globe, and the rose-wing to illumine the shoulder. This done, the Pouter was perfect, precluding farther improvement or embellishment. The breeder was then left to use intelligently the law of selection for the preservation of all characteristics. It cannot be denied that in the long-continued application of this law something has been attempted in the way of improvement, and that every such attempt means the introduction of a foreign element. But unless the proper proportion of parts—in other words, the definition given, be kept in view the result is deterioration. Had limb only kept pace with recent elongation of feather, present breeders would have good cause to congratulate themselves. As it is, we are inclined to accept Mr. Ure's statement that the birds of the old school were more perfect Pouters. It can be no intelligent use of the fore-mentioned law to sink all qualities for the conservation of one, be it colour or anything else. Nay; the intelligence displayed will just be in proportion to the number and importance of the characteristics preserved. Their relative importance we have indicated, and can only add, as the result of our experience, that we would rather discard a badly-shaped Pouter than a badly-marked or off-coloured one otherwise possessed of the fundamental excellencies of his breed. The carvings of antiquity, though beautiful in themselves, can give us no idea of the noble buildings they adorned, and be it remembered that no amount of sandpaper and varnish can ever conceal bad construction.

Blood, by which we mean the tendency to revert to ancestors, is of course a great thing, and some otherwise weedy birds possess the faculty in a marked degree. But it is not everything, and pushed to extreme is an absurdity, as will be seen on a moment's reflection. Fighting one's way into a strain, it is undoubtedly the shortest and surest course to let only the fittest survive—fittest, be it remembered, in terms of the definition. Guided by any single idea, there is a limit to the experiments, and a time certainly arrives when it is absolutely necessary to re-make the type or call in the aid of the much-condemned birds if we wish to preserve the taper body and high shoulder of this most kingly bird. Which is easier? Woful, then, is the plight of the fancier whose appetite for "Pied Pigeon" or single ideas has overcome his discretion. Were the straightforward policy of Mr. Stuart correct we would all be breeders alike, and standard birds plenty as pebbles. He speaks hastily, and, as it appears, against part of his experience, when he says we can do without them. To sum up: If we must deteriorate, by all means let colour and marking go first. *Chacun à son goût.*

The exposition of these breeding opinions (lofty ideas we may call them) on paper or the show-table, aiming as it does at the preservation of perfection, can surely never be charged with being antagonistic to that aim. We allow that a blue chequer is not a pretty colour, a black chequer only passable, a sandy and most splashes simply ugly, while their introduction into a loft where colour and marking is the *ne plus ultra* will assuredly create a difficulty. Their supporters do not breed for them, but through them, and in the overcoming of the difficulty is their keenest pleasure. From this off-coloured denunciation we except the Mealy. We know something of him, and would not be in the least mealy-mouthed to sound his praises did space permit. We simply add our concurrence in the regret of anything that tends to the discouragement or stamping-out of this unique combination of beauty and usefulness. To conclude, when we are all agreed on the end to be attained, why quarrel about the process?—D. McNAUGHT, *Kilmaurs, Ayrshire.*

BRITISH BEE-KEEPERS' ASSOCIATION.

FIRST GREAT EXHIBITION.

I FIND many bee-keepers who were not able to be present at this Show are desirous of learning where the various hives and

appliances (Ligurian queens and stocks), are to be obtained. Will you kindly announce that our Committee are anxious to disseminate all information that will tend to advance bee-keeping? and I shall be happy to put intending purchasers in communication with the vendors, or, if preferred, procure and forward any article desired, as well as give any information in my power, either through your columns or privately. I should also feel obliged by your noting the following addenda et corrigenda to the prize list—viz:

CLASS 22.—2, J. Armstrong.
CLASS 24.—3, A. Ferguson. 4, W. Martin. 5, L. Reed. 6, T. Anstin.
CLASS 25.—3, S. J. Baldwin. 4, W. Martin.
CLASS 26.—4, J. Walton.
CLASS 27.—Equal merit, C. N. Abbott and J. Lee, in lieu of first and second.

—JOHN HUNTER, *Eaton Rise, Ealing.*

"You know you are a sort of cross-breed, 'D,' so you can do that," was "our doctor's" address to me the other day. I need not say what that was, but I at first thought the "cross-breed" had some reference to my Huguenot descent; but found that it was not so, but that my interest in things connected with this Journal was not confined to flowers, as I went in for fowls and bees. Well, I didn't do that; but the same reason holds good, I suppose, for my being asked to say something on the wonderful exhibition which was held last week at the Crystal Palace, on all things aërial the little busy wee things whose ways and means have pointed many a moral along the ages, but who never, perhaps, received the attention they do now.

The first thing that struck me on going into the Exhibition was, What a strange world is this we live in! Here was an enthusiastic crowd of men in all stations of life, whom one had never seen before, to whom all that belonged to these little busy insects was as much a matter of interest as were the flowers and fruits which filled the other part of the transept; who have their own journal, from which, surely, nothing but bonied words ought to distil; whose talk was of supers, bars, Woodburies, German fungus, and other matters which were High Dutch to all but the initiated. But it was extraordinary how large a number of persons seemed practically to be acquainted with, and in some measure to understand, the difficult operations connected with bee-keeping.

And now first as to hives. A large number of these of straw, wood, or both combined, was exhibited, and of various degrees of excellence, the point most regarded being the facility of operation and cheapness of construction. Of course the bar hive stands out as the only one really deserving of recognition now-a-days; and Mr. Abbott of Hanwell, a most thoroughly practical bee-keeper, deservedly stood first for having introduced a bar hive which can be made for cottagers at 3s., placing thus the best-constructed hive within the reach of all. It is astonishing how the cottager still clings to his straw skep and to the practice of smothering his bees, and how every failure (and failures there are ever likely to be) of those who keep bees on more humane principles is blazoned forth as a proof that these new-fangled notions will not do, while they also cling to the notion in many parts of the world that the hives ought not to be taken until hopping time; and as they have few flowers here after the limes are over, it is clear that for a month they are consuming the honey they had stored up. One exhibitor showed a marvellous structure which would have delighted a cockney gardener—a house in which several hives were stored. I have myself had sad experience of houses of a more humble structure—the wax moth got into them. Last year I lost one hive by it, but thought it was all gone. To my surprise and horror I find that it has this year destroyed entirely a fine Woodbury hive, so that my stock is now greatly reduced; and I believe the advice of all experienced bee-masters now is, Let each hive be protected, but let it stand by itself. The modifications of the Woodbury hive were numerous, but that something has yet to be done may be gathered from the fact that the prizes for the best hive for observation purposes and also that for the best hive on the collateral principle were withheld. A very beautiful breed of Ligurians was exhibited by Mr. W. C. Smith, and deservedly obtained a prize; while some grand boxes and supers of various kinds were exhibited. One exhibited by Mr. Carr was declared by him to be above 100 lbs., a marvellous result from one hive, although this did not obtain the prize, and we may therefore conclude that that which did so was heavier still.

It was a bold idea to attempt to show in such a place as the Crystal Palace some of the more delicate manipulations by which the bee-master gets the greatest benefit from his interesting stock; but the driving of bees was most successfully shown by Mr. Abbott, assisted by Mr. Cheshire and others of the Committee. Those of the readers of the Journal who keep bees know what driving is, but many even of those who keep bees would have been glad to have had the opportunity, as they had, of seeing the operation performed. The Bee-Keepers' Association deserves great praise for the manner in which they have carried out the details of the Exhibition; and knowing as I do the stimulus that horticultural exhibitions are to the growth of flowers, I have not the slightest doubt that the Exhibition of

bees held at Sydenham will mark a new era in the history of bee-keeping in this country.—D., *Deal*.

THE Committee did well in selecting the Crystal Palace for their first Show. Very few buildings could afford a length of more than 600 feet of staging, and leave room for the perambulation of many thousand people. The astonishment of the visitors at the beautiful honey display was excelled by the earnestness with which the bee-keepers and the *would-be* bee-keepers examined the various hives and apparatus. The exhibitors present, and the gentlemen of the Committee, spared no pains to explain the working of everything inquired about; and we will now endeavour to place before our readers our impressions of what we were enabled to inspect.

Commencing with the *hives*, we found nearly all the various systems represented. Class 1, for observation purposes, had six entries. The Judges, however, awarded no prize, on the ground, as we were informed, that they saw nothing of sufficient merit. We think they were in error here, as an observatory hive, No. 1, exhibited by the well-known Messrs. Neighbour & Sons, was one of the best hitherto designed; and although an experienced bee-keeper can dispense with the necessity of having the bees all imprisoned when studying their economy, it should not be forgotten that ladies and others cannot all act with the same impunity, and for such a glass-covered hive is a desideratum. No. 2, exhibited by the Rev. F. Leaver, was simply a pretty toy of no practical use.

Passing on to Class 2, "for the best skep or box hive for depriving purposes that can be supplied for 3s." Some very good straw skeps were shown. One, No. 9, exhibited by W. Martin, even was fitted with bars, but the prize in the class was, we think, justly awarded to Mr. C. N. Abbott for a veritable Woodbury, price 3s., with many improvements, small in themselves, but great in the aggregate, which time and experience have taught to be desirable. Practical men have begun to think that a close-fitting crown-board is a mistake; and here we have a square of carpet in its place, which is said to be a better covering, allowing easier ventilation. If the spirits of the departed can take any interest in things mundane, how gratified the shade of our late esteemed correspondent, Mr. Woodbury, must be at finding that no excuse can now be made by the *poor* man that scientific hives are too expensive for his use! In this class there were seven entries, each well worth the price affixed.

Passing now to Class 3, "for the best moveable comb hive for depriving purposes," we have no limit of cost; and, consequently, the prices range from 5s. to £21. The latter for No. 16, which its inventor styles the "Sibertswold," we can only look upon as a fancy price. The prize was awarded to Mr. F. Cheshire; and certainly this hive was a marvel of good workmanship and thoughtful attention to the requirements of its inhabitants, both for breeding and honey-gathering purposes. All who can afford its price, 50s., will do well to provide themselves with one, if only as a pattern for home-manufacture. Among its specialities we may mention that the outer case is double, enclosing an air space, which greatly assists in keeping an equable temperature. The floor-board is moveable, and fluted to facilitate the riddance of wet. The entrance can be contracted at will, and the whole is covered with a substantial weather-proof roof. An inspection of the inside shows the frames reposing on a knife-edge slip of zinc in such a manner that they cannot be propolised. There is no interspace between frames and crown-board; and the latter also forms an adapter, and enables feeding to be carried on without disturbance. A moveable diaphragm at one end of the hive permits space to be at once obtained whence to shift the frames without being under the necessity of removing them from the hive. Its capacity by the same means can also be reduced at will. Altogether, we think that Mr. Cheshire may be congratulated on exhibiting the best hive we have yet seen.

Another novelty was No. 36, exhibited and designed by Mr. C. N. Abbott, the Editor of the "British Bee Journal." This hive attracted much attention, and is likely to do good service to its purchaser. One of the peculiarities of the frames is an absence of the bottom rail. Excepting being some protection against the warping of the frame, we think it well dispensed with. There is no vacancy here between the upper surface of the frames and the quilt or carpet, which takes the place of crown-board. This is put forth as an advantage proved. Woodburys of more pretensions than No. 13 figure here, but seem rather in the shade by the side of their aristocratic rivals. Altogether we found twenty-five entries in this class, and Class 4 obtained eleven, the prize in which was taken by Mr. J. Lee with the well-known Carr-Stewarton, a useful hive, and very ornamental for the lawn or garden. No. 40, "Rusbridge's Cabinet," attracted much attention, and its courteous inventor was unflinching in explaining its features. It, however, seemed far too complicated to make much way. The same remark holds good with No. 42, "King's Patent Safety."

Class 5, "for the best hive for use on the collateral principle." This system is evidently, like the old close skep, doomed. It elicited but five entries, not one of which had much merit; and

this was the opinion of the Judges, the prize being withheld. No. 51 was certainly novel, as was its name—"The Bell-glass Straw Balloon." We pity the bees compelled to dwell in it. From the great loss of heat they must sustain, prosperity would be hopeless.

The completion of the hives was attained by Class 6, "for the most economical (best and cheapest), complete hive on the moveable comb system for cottagers' use." The prize in this was taken by Mr. C. N. Abbott, for what may be termed an "improved" Woodbury, price 6s. 6d., with quilt and roof, only wanting paint to make it a hive good for ten years' service.

Altogether the hives numbered sixty. Certainly a better assemblage than ever was gathered together before, from which the working man with brains as well as hands could see at once how to make the hive most suitable to his wants.

In Class 27, "for the best and largest collection of hives, bee furniture, &c.," the two competitors, Messrs. Abbott and Lee, ran a neck-and-neck race. The first-named made his show in greatest variety, the latter's certainly appeared neatest and best made. No other competitors came near them, and the third prize was withheld.

Class 28, "for the best drone trap," elicited four competitors, and the prize was gained by Mr. Cheshire; and in the next class, for feeders, the same gentleman showed a contrivance beautiful in its simplicity, but which the Judges evidently thought inferior to No. 246, exhibited by Mr. J. S. Turner. Mr. Cheshire's feeder simply consisted of a plate of vulcanite on a pivot pierced after a particular pattern, and intended to be used instead of the perforated zinc usually placed on the feeding-hole. Being a non-conductor, it is not chemically affected. A bottleful of syrup is simply inverted on it, and the vulcanite can be turned about to regulate the supply at will.

Class 30, "for the best appliance for introducing queen bees to stocks." Nothing better appeared than the queen cage of our old acquaintance, "A RENFREWSHIRE BEE-KEEPER," which gained the prize.

Class 31, "for the best bee-dress." No novelty appeared, if we except an excellent make of gloves of india-rubber, similar to tobacco pouches, which is a great improvement on the clumsy macintosh.

Class 32, "for the best method of quieting bees during manipulation." The articles competing were simply smokers. The prize went to No. 261, Mr. F. Cheshire.

Class 33, "for the cheapest and best supers for general use." Nothing particularly worth notice; but Class 34, "for the best honey-extractor," seemed the most valuable novelty of the Show. There were but four entries, the principle of all being the same—i.e., centrifugal force. The decision of the Judges was in favour of No. 246, made by Starling & Co. Herein we must differ. Those exhibited by Mr. Walton and Mr. Cowan certainly appeared to work smoother, had greater simplicity, and last, not least, were about half the price. Starling's machine consisted of a skeleton wooden frame nearly 2 feet square, and about 3½ feet high. Within the frame is a galvanised iron barrel, 2 feet high, and nearly the same in diameter, enclosed in which is a revolving framework in which the combs are put to be emptied. Motion is obtained by handles and cog-wheels at the top, and the centrifugal force given to the frame throws out the honey against the side of the can, whence it runs to the bottom to be afterwards let out at a tap. The whole machine appears to be about one-third bigger than it need be.

In Class 27, which was devoted to new inventions, Mr. F. Cheshire took no less than four prizes—in fact, all that was awarded. The gem of the whole being what he termed a "transferring board," for the purpose of transferring combs from straw skeps to bar-frame hives, of which we will endeavour to give a description, but it can only be properly explained by means of a drawing. When open, the board consists of sixteen wooden tongues, fixed like the teeth of a comb. It has legs which support it at a convenient height above the table, and underneath, a pan to catch any dripping honey. On the tongues is placed the comb to be transferred, and the frame is fitted on to it. A lath is then laid in position under the comb, and a tape passed between the tongues and fastened at once at the top. The board is very ingeniously arranged, so that it can throw the comb at once into the perpendicular, and enable the comb to be lifted out and placed forthwith in the new hive. Mr. Cheshire truly must have the organ of invention highly developed.

Having gone through the hives and apparatus, we now pass into the manipulating-room, where experienced hands are giving public lessons in driving, transferring, &c. This is a most interesting part of the Show, and the public think so too, for the place seems always crowded. Behind a glass screen the demonstrator exemplified how simple it was to empty a hive of its rightful inhabitants. The operation seemed the same as described by Mr. Woodbury in our columns many years ago. The combs of many skeps were dexterously transferred to frame hives cleanly and quickly by means of the prize "transferring-board," and the action of the honey-slinger shown many times

each day. The burden of the work here fell upon Mr. Abbott and his son; the latter, although a lad, seemed quite fearless of the bees. Whilst the operations were progressing they were explained by one of the Committee to the spectators. The visitors seemed astounded at the impunity with which those behind the screen handled and moved about amongst the bees; but the fact was, the generally irritable little beings were so scared that they had forgotten how to sting. A little practice is worth a deal of theory, and we feel confident that scores of bee-keepers after their lessons here will in future resort to driving in lieu of burning their bees.

Altogether we must congratulate the British Bee-keepers' Association on having in the first year of their birth achieved an immense success and given a great impetus to bee-keeping. Errors and shortcomings were inseparable in their undertaking, and must be looked upon leniently; but *experientia docet*, and we have no doubt their next venture in the same direction will be an improvement on their first.

BEE-KEEPER'S CALENDAR FOR SEPTEMBER.

(Concluded from page 245.)

WE have come at last to the process of taking honey and wax. I dislike the job, and dislike to talk about it. I would rather swarm fifty hives artificially than take and run the honey of one. Happy is the apiarian who has a sturdy wife or servant to undertake this work. Many old women are first-rate hands at taking honey. I am only a pupil teacher in this school, and have been in it for many long years without making any progress at all. When I was a gentleman's gardener I regretted that no one had invented a machine for sweeping leaves up in autumn. I then thought, and think still, that a machine for sweeping lawns could be invented and produced. What an annoyance it is to employers to see six or ten men hunting leaves every morning in front of their sitting-rooms! For many years I have wished that some ingenious apiarian would produce a machine for extracting honey from combs. Let my friends Mr. J. Lee, of Windleham, the great hive manufacturer, and Mr. R. Astou, who has invented excellent drone traps, consider my suggestion. At present we go in the rut of our great grandfathers. As soon as honey hives have lost their bees they are removed to as warm a room as can be found (we put ours in a vinery). The sticks are at once withdrawn, the combs are taken out of the hives, and the honey parts are placed in one milkpan and the refuse combs in another pan. If there is a fire in the house the honeycombs should be kept near enough the fire to gain warmth, but not near enough to melt the wax. The warmer the combs are, the more readily does the honey run; hence the desirability of running the honey before the natural heat of the combs is lost. After the honeycombs are well broken up they are poured into a bag of cheesecloth or thin towelling. The honey runs through this bag into a vessel. Next morning the honey is skimmed, and ready for use or sale. This seems to be a very simple and easy process. Yes, but it is a slow one. As the honey cools it thickens and stops running. We frequently hand-squeeze the bag to get all the honey through it while it is warm. Moreover, we frequently squeeze the honey out of the combs before it is put into the bag. This is the speedier way, if it is not the best at present known.

There is a right and a wrong way of squeezing combs, and the right way is learned by practice. Heather honey cannot well be extracted from combs without squeezing. A machine to answer well should have the pressure put on the edge of the combs, and not on their broadsides. The reader will catch my idea if I say that sheets or cakes of honeycombs should be placed between two perforated boards or sheets of iron, and these pressed with something like a pump-handle, having a strong leverage. In hand-squeezing, the sides of the cells are pressed together. The object is to have honey perfectly pure, without a particle of farina in it. In taking honey nothing need be lost. The combs that have been drained, and the refuse combs that contain honey amongst the brood, should be given to weak hives or those that need food. The bees will gather up every drop of honey, and their filters are so perfect that not a speck of impurity will be carried into their own combs. If honey be mixed with pollen, soil from the garden, or flour, and given to bees, they will take the honey and leave the rest. In filling supers by giving bees the refuse combs and honey tainted with farina, I have been frequently struck with the excellence of the honey so purified by them.

After all the refuse combs have been cleansed of honey they are carefully gathered together for wax. They are put into the same kind of bag as that through which the honey was run, and boiled in water in a copper or boiler. The wax comes to the top like a yellow oil; it is skimmed off and put through a bag or sieve, letting it drop into cold water. A second time it is boiled in clean water, and put into dishes to cool and cake. A letter from a lady in Australia came here a few months ago asking many questions about bees, and one of them was for information how to clean her pots and dishes of the wax that adhered so tena-

ciously to them. A good handful of soda thrown into warm water and applied to wax destroys in a great measure its adhesive properties. Good wax is easily saleable. We are offered 2s. 3d. per lb. for ours.—A. PETTIGREW.

OUR LETTER BOX.

MIDDLETON SHOW.—Mr. O. E. Cresswell states, "I sent no birds to the Show, though I had entered some, and my pens were or ought to have been empty. If other birds were put in my pens with my name upon them, it is a highly blameworthy proceeding of the Secretary."

TOMMOUREN SHOW.—Mr. S. Ball writes to say that he was awarded the first prize in the Angora Rabbit class.

OIL PAINT ON PLEUMAGE (*Gallus*).—We believe turpentine will remove it. If it does not, and you wish to exhibit them, do so with the paint. An accident is not a disqualification.

SALE OF HONEY (*Alfred Pocock*).—It is not our custom to name buyers and sellers of articles. If we were to name a house or mart for honey at a good price, we might possibly induce too many sellers to offer their goods there, and thereby do something to lower prices, which range from 1s. to 1s. 6d. per lb. Let your neighbours know that you have honey to sell.

UNITING SWARMS (*W. E. M.*).—We cannot account for the failure; we always succeed, and therefore think that the cause of the failure is not in the mode or principle, but in the application of it. The feeding is to put bees off their guard to a certain extent, and the use of mint is to prevent one swarm from smelling another. We remember attempting to unite two swarms without feeding or anything else. A swarm was cast into a strong hive, and instantly a wholesale slaughter commenced, when we ran to a bed of mint, tore off a large handful, and crushed it as we returned to the hive. This crushed mint being cast amongst the combs and bees put an end to the slaughter. If we had not applied the mint every bee of the euredendred swarm would have been killed in fifteen minutes. In casting both swarms on a cloth and letting them creep together into a hive, they are put to the disadvantage of considering themselves trespassers or poachers; both swarms seek safe shelter, and have nothing to defend at the time. The dead bees in front of your other hive were probably robbers.

ABBOTT'S HIVES (*F. W.*).—We cannot inform you where they can be purchased. Write to the dealers in hives who advertise in our columns, and see a letter on another page.

TAKING HONEY WITHOUT DESTROYING THE BEES (*St. Bridgid*).—Your plan of "sneaking an empty hive with syrup, and putting it upside down under your full hive," will certainly not induce the bees to desert their well-found home, although, doubtless, they will descend and carry up the syrup. Driving is the simplest process, which has been frequently described in these pages. For 5d. you can obtain full printed directions by return of post from this office if you will order "Bee-keeping for the Many." Now is a good time to take your honey; if later you will probably get less of it.

RED LICE ON CANARIES (*W. L. K.*).—They are not lice, but red mites or cage bugs, a species of *Acarus*. They live in the cracks and joinings of the cages, and at night sally forth to suck and annoy the birds. By thoroughly cleaning the cages, saturating the cracks with linseed oil, and then filling them with flowers of sulphur, and dusting sulphur among the birds' feathers, also by cleaning the nest and sprinkling powdered sulphur in, you can get rid of these pests. Wherever any floury or mouldy appearance is noticeable about the joints or crevices of the cage, these torments to the birds may be suspected, and no time should be lost in giving them notice to quit.

PRESERVING STONE FRUIT (*K.*).—You will find an article on the subject in vol. xiii., page 319 (No. 693).

MEAT-MAKING (*W. H. A.*).—To a gallon of water put 2 lbs. of honey and 1 lb. of sugar; boil for an hour, put in the whites of four eggs to raise the scum, and skim it quite clear whilst boiling; then put it into a clean tub and let it stand for a week, putting in a toast with honey to make it work; then tun it, put in the peels of three or four lemons, let it stand for a month, and then if it is not sufficiently fine put in more honey, and let it stand longer.

REMARKS.

9th.—Fine early, rain at 10 A.M., and heavy at 11, thunder at 4 P.M., lightning at 11.17 P.M., and a wet night.

10th.—Very fine, but rather cold morning, thunder at noon, and 2 P.M., and in the afternoon; wind rather high, and alternate sunshine, and short showers.

11th.—Fine early, but rain by 8 A.M.; a wet uncomfortable day, with scarce a gleam of sunshine.

12th.—Fair, but rather dull early, then fine till 5 P.M., when it looked very stormlike, and a few large drops of rain fell; a shower at 6 P.M., but a fine evening.

13th.—A very bright enjoyable day throughout.

14th.—Hazy from 7 to 10 A.M.; fine till noon, then cloudy for an hour or two, but very fine afterwards.

15th.—A most beautiful day, as bright and clear as June, with a very pleasant A week of very unsettled weather; some days being cold and quite autumnal, others as bright and pleasant as possible, the temperature in all cases a trifle lower than that of the preceding week.—G. J. SYMONS.

WEEKLY CALENDAR.

Day of Month.	Day of Week.	SEPTEMBER 24—30, 1874.	Average Temperature near London.			Rain in 43 years.	Sun Rises.	Sun Sets.	Moon Rises.	Moon Sets.	Moon's Age.	Clock after Sun.	Day of Year.

From observations taken near London during forty-three years, the average day temperature of the week is 65.5°; and its night temperature 43.8°. The greatest heat was 82°, on the 25th, 1832; and the lowest cold 23°, on the 23th and 30th, 1835, and 29th, 1812. The greatest fall of rain was 1.68 inch.

NOTES ON SOME OLD PLANTS.

COMMELINA CELESTIS is a plant now but seldom met with in gardens. It is not showy, and will not sustain the epithet magnificent, yet it is very beautiful in its own quiet way, and is altogether a more attractive subject than most people are aware of.

In many books and catalogues it is described as a stove plant, but this is not correct, or is so only to a certain extent; for although it does well under stove treatment, it does still better when grown as a half-hardy tuberous-rooted perennial, which in reality it is, like the *Dahlia* and *Salvia patens*.

The best way to get up a stock is to sow in heat early in spring; and as the seed germinates very freely, a hundred or so of plants will be the outcome of a shilling packet of seed. These, either potted-off three in a pot or pricked into boxes, gradually hardened, and planted-out in May, will begin to bloom early in July. They do not, however, as a rule, flower very profusely the first year, but the second their capability in that way is something not to be complained of. They are most suitable for planting in a mixed herbaceous border light and sunny, in clumps of three or four, and they seldom require stakes. Their tripetaled flowers are of a peculiar silky glossy texture, and the colour, as the name implies, is a light sky-blue of a tint nearly unique amongst flowers. They are easily damaged by rain, but a day's sunshine brings out more in abundance from the curious little pouches or spathes in which they are enclosed. There is a white variety, but it is not nearly so well worth cultivating.

About the **MARVEL OF PERU** (*Mirabilis Jalapa*), there is nothing specially marvellous, except that, being such a sportive plant, we should have no better varieties of it than we have, although as it is it gives us a great variety of colours. How it got its big name it is not easy to guess. Pizarro and his interesting ragamuffins certainly unearthed greater wonders than this in that once-venerable country (Peru), and probably the recollections of these influenced the introducers of this pretty flower; or more likely its extreme variability of colour both in flowers and leaves might in these days be deemed something miraculous.

It may be raised in the same way as *Commelina*, but in Scotland it requires a warmer and more sheltered border. I find it succeeds best when treated in the following manner:—Having procured the tubers, pot them singly into 6-inch pots, and start them in gentle heat not earlier than the beginning of March. If small, two or three may be put into each pot. By the middle or end of May throw out pits 10 or 12 inches deep in the border where they are to be planted. Into each of these put an inverted 9-inch pot at such a depth that its bottom will be only an inch or so below the surface of the ground, and put a plant on each side of and close to the pot. Thus managed the temperature of the ad-

joining soil is raised to an appreciable extent. This simple plan can also be used with advantage in the case of many other tender plants.

When cut down by the frost, the roots are lifted and treated as *Dahlias*.

It may be here remarked that one of the elements of success in growing large numbers of half-hardy plants which require their roots to be protected during winter, is the grouping together of such as are found to agree with a somewhat similar treatment. It may be difficult to suit exactly the tastes of each, for flowers, like mortal men and women, have queer likes and dislikes; but a little experience soon enables the observant cultivator to treat each group in a way that is best for it as a whole, although the subjects composing it might be individually better cared for if time and room permitted. Thus, whoever grows *Dahlias*—and who does not?—may keep a whole host of other good things going in the same track.

There is another old plant well worth calling attention to, not so much on account of its beauty as of its season of bloom, which, beginning with September, extends well into the following month. This is *LOBELIA SYPHILITICA*, with light blue spikes, from 2 to 3 feet high. It is not so showy as plants of the *Lobelia fulgens* or *splendens* class, but it has the advantage of being perfectly hardy, which these are not. If raised from seed sown in slight heat in March it will bloom the same season, and it may afterwards be propagated by offsets in the same way as *fulgens*. A bed of it edged with something brighter and more decided in colour has a soft and pleasing appearance, and being of a robust habit it stands the autumn storms well.

In looking over lists of hardy herbaceous *Lobelias* in some of our standard books, it has often struck me that either many of the sorts there enumerated are now lost, or that many of the names are synonymous, or that—which is the most likely supposition—my acquaintance with them is very limited. I have before me a list of upwards of twenty, two-thirds of which I rather think nine gardeners out of ten have never seen. Perhaps some correspondent of the *Journal* would kindly call the roll that we may know what we have, what we have lost, and what we never had.—R. D. TAYLOR.

ANNUAL RENEWAL OF STRAWBERRY BEDS.

THE observations on this by "W. R." in last week's *Journal* contain a remark to which I as a Strawberry-grower for many years take exception. He says, alluding to the annual renewal of the beds, that it is "only resorted to by those who do not properly prepare their ground in the first instance, and know very little about Strawberry growing," &c. For my own part I have always recommended annual renewal, because I find it answer best; and that the older the beds are, the crop deteriorates in the same ratio; besides, several plants die every year, which does not improve the appearance of the beds. I have also repeatedly in this *Journal* stated how the beds are prepared. Then as to results: I have taken

more first prizes for Strawberries during the last six years at the great exhibitions in London than all other exhibitors put together, and all the fruit has been gathered from plants that were runners the previous year; and I fancy if other successful exhibitors were to write their experience they would say the same. As far as I am concerned, I can truly say that all the fruit sent-in to the house is of the same quality as that which goes to the exhibitions. As to quantity, a remark I once heard the late Mr. Robert Fish make is not forgotten, and in the case of Strawberries is invariably followed out. "Cram them, cram them," was the veteran's remark; and this we do for four months.

Then as to the remarks made by "W. R." about varieties. It does seem that some varieties specially interesting to him are not thought so much of by "gardeners who talk very large in print," "and who dictate the only sorts that should be grown." I would like to tell "W. R." that we gardeners only recommend the sorts we find to answer in our own gardens, and this we do for the information of the readers of the Journal, and that we have not the least interest in the varieties whatever further than that. I grew and fruited two sorts recommended by "W. R."—viz., Early Prolific and Duke of Edinburgh, but both sorts were discarded after one year's trial. They were neither considered so good for forcing nor for exhibition as the older sorts. If they had, would it not have been foolishness on my part and great waste of my employer's money to have thrown them away? Does "W. R." think that gardeners will believe him when he says that he saw ripe fruit of Duke of Edinburgh early in April "produced with little or no artificial heat?" They must have been forced Strawberries in the usual sense of the word. What does he mean by saying that it is "simply ridiculous" to compare such sorts as Black Prince and Keens' Seedling with Early Prolific? Is it that Early Prolific is so much superior to them? If so, I differ from him. I still consider Black Prince the best variety for early forcing, and Keens' Seedling is the best to succeed it, to be followed by President and British Queen.

It is quite natural that "W. R." would rather accept the opinion of such men as De Jonghe or anybody else who think the same as he does, and who praise Early Prolific as a "masterpiece of skill." For my part I always make an allowance for the statements of foreigners (this with no disrespect to M. De Jonghe and M. Gloede). For instance, what can any practical man make of a description of an Orchid by a gentleman with a foreign name in a contemporary last week? He said the lacinulæ "spread as the fingers of a man swearing before lawyers." Of course we must make the best of such a description, and try to fancy what the flower must be like, the same as we do when an ordinary Strawberry is described as a "masterpiece of skill." No one would make such a remark unless specially interested.—J. DOUGLAS.

ROSE-GROWERS' CONFLICTING VIEWS.

AN American paper tells a story of a man who, having just bought a horse, consulted various authorities as to the manner in which it should be lodged. He read that a side window in a stable makes the horse's eyes weak on that side; a window in front hurts his eyes with the glare; a window behind makes him squint; a stable with a skylight is too hot in summer and too cold in winter; a window in a diagonal line makes him shy when he travels; and the absence of a window makes him blind. So the animal was taken to the auction mart! It appears that there are also "conflicting views" as regards Roses. I have been reproved by two authorities for not recommending Marie Baumann, and for recommending Edward Morren and Vicomtesse de Vezins, two noble Roses, full-sized, good growers, very hardy, abundant bloomers, and excellent exhibition Roses, the former being globular and the latter compact and expanded. Both these Roses are included in a select list by Mr. George Paul. In the same list is Marie Baumann, with this observation, "A little weak in growth." If it is a weak grower in such fine Rose land as Mr. G. Paul's, what can be its growth in inferior lands? It is a beautiful Rose, but twenty-one plants of it here have dwindled away and died. For this reason I do not recommend it to the general public. La France is in the list referred to; it is a capital grower, hardy, and finely foliaged, but it does not bloom freely here. My account of it is the same as Mr. Cant's and that of "G. S.," one of our best amateurs. I lost out of 2400 Roses six last winter, and about as many this trying summer. I never saw a finer sight, about June 14th, than the first series here. Many

of the first blooms had to be cut away, as the spring frosts, followed by a scorching sun, injured them. As regards Baron Chaurand, it is rightly described by Mr. W. Paul as "one of the best dark Roses," which is quite true. It is lovely, and perfect in its colours and form, but it is not a large Rose. I have thirty-two plants of it, and shall buy fifty more. I have twenty in one bed, and a more beautiful sight I never saw than these plants in full bloom at the same time. I will not recommend bad growers, tender Roses, or reluctant bloomers. In the same list Mr. G. Paul says of Mademoiselle Eugénie Verdier, "Rather small grower, but too beautiful to be omitted." I have three plants of it here; it is a bad grower, and hence I have not recommended it. Louis Van Houtte, fifteen plants, has done well on the seedling Briar.

The following are beautiful Roses for exhibitors, but they are too shy in growth for the public:—Marie Baumann, Louis XIV., Madame Furtado, Marquise de Mortemart, Horace Vernet, Monsieur Noman, Xavier Olibo, and Lord Macaulay, a first-rate Rose.

I get on pretty well with Lord Macaulay by cutting the plants down to the stump every spring. Instead of Macaulay you must have Lord Clyde, which is an excellent Rose and a strong grower. It does Mr. G. Paul great credit as the raiser. We want decorative Roses as well as show Roses. Those I recommend will mostly serve both purposes.

I am glad that I agree with Mr. Camm about Paul Neron, the ragged crater of Vesuvius, and also as to what he says of Souvenir d'Elise. There seems to be a rage among nurserymen and some amateurs for huge Roses. I think it was the late Mr. Glenny who said, "Some men judge flowers as farmers do hayricks, by the number of square yards in the rick instead of by the quality." Some of our most perfect Roses are either small or medium-sized—for instance, Duchesse de Caylus, W. Griffiths, Cécile de Chabillant, Mesdames Rivers and Vidot, Empereur de Maroc, and Baron Chaurand. I have yet to learn that small or medium-sized Roses are not fit for exhibition.—W. F. RADCLIFFE, *Okeford Fitzpaine, Dorset.*

PLUMS IN WORCESTERSHIRE.

AT this time of the year you generally publish a class list of the best Roses elected by the votes of some of the most distinguished growers, and when so many of your readers are interested in the beautiful I feel almost ashamed to intrude upon them with a question of profit; but it may be interesting to some to know the comparative merits of different varieties of Plums. I therefore send you an account of the market value of the crop of certain specimen trees which were planted in the year 1864, and are now in their tenth year.

The market price of the different varieties in this district has been as follows:—Pershore Eggs, 8s.; Rivers's Early Prolific, 12s.; and the other varieties named, 14s. per pot of 90 lbs. weight, the pot (about 7 lbs.) included. The money value, according to the above scale of prices, of the produce of one specimen tree of each of the following varieties, which are planted side by side in rows, as nearly as I can estimate it has been as follows. I have classed them in order of merit. Pond's Seedling, *alias* Fonthill, £1 1s.; Victoria, *alias* Alderton, 18s.; Black Diamond, 16s.; Pershore Egg, 12s.; Cox's Emperor, *alias* Denbigh, *alias* Jemmy Moore, 9s. 6d.; Prince Englebert, 8s.; Autumn Compoète, 7s. 6d.; Rivers's Early Prolific, 6s.; New Orleans (a local Plum), 5s.; Kirke's Plum, Belgian Purple, Done Bank, Reine Claude de Bayar, each 4s.; Oullin's Golden Gage, Jefferson, Washington, each 3s.; Green Gage, 2s. 6d.; Purple Gage, 1s. 6d.; Mitchelson's, 4d. Some varieties are still upon the trees—e.g., the Belle de Septembre, the Winescur, and the Prune Damson, but I do not anticipate that they will average more than 2s. each per tree according to the prices named above. Of course this estimate of prices with regard to some varieties is to some extent guesswork, but I think that I am within 6d. of the value of the different trees.

At the beginning of the season we were very much pestered by blackbirds; but it is a curious fact that when the wasps and hornets came, as they have done this year in greater numbers than I ever remember, the blackbirds disappeared. I should be curious to hear if the same result has been noticed elsewhere. The Plums which are least attractive to these depredators are Pond's Seedling, Black Diamond, and Prince Englebert, but they rejoice in anything belonging to the family of Gages. Wasps seem to prefer Pears, such as the Colmar d'Eté and Williams's Bon Chrétien even to these.

It will be seen by the above list that Pond's Seedling has

this year attained the first place. This Plum has the reputation of being a shy bearer, but I find it very prolific on high ground out of the reach of frost. It does not come into bearing so early as the Victoria, nor as a rule does it crop so heavily, but it grows quite as strongly, and is much tougher in the wood, and the fruit is larger in size. If Plums are grown for profit, I should draw a line below the Rivers's Early Prolific as it stands in my list.

The Pear crop is very good this year, but I notice a curious result. I have varieties of Pear—*e.g.*, the Louise Bonne and Vicar of Winkfield, grafted on three different stocks—the Pear, the Quince, and the common Quirk or Whitethorn, and the Pears on the Quirk stock are this season half as large again as any of the others.—WILLIAM LEA, *St. Peter's, Droitwich*.

NORTHAMPTONSHIRE HORTICULTURAL SHOW.

NOVELTIES IN THE ROYAL GARDENS, KEW.

THOUGH a dull season of the year for Orchids in flower, there are still several of much beauty and interest. Two good varieties of *Odontoglossum grande* are very attractive. *Zygopetalum maxillare* is still in perfection, and the rich bine of its lip is in contrast to the colour of everything else. *Miltonia candida* var. *grandiflora* is very beautiful; so also is an extra fine variety of *Miltonia Clowesi*. Among the *Oncidiums* are *O. Harrisianum*, *O. Wentworthianum*, *O. obrizatum*, and *O. Limminghii*: all are worthy of cultivation. The first has a very neat habit; the last is remarkable, "perhaps the most singular in the whole genus." The flowers are large in proportion to the size of the leaves, which are closely adpressed to the block on which the plant is growing. There is a good variety of the beautiful and distinct *Cattleya Adairiae*; this plant appears to flower freely. Others are *Dendrobium chrysanthum*, *Pleione lagenaria*, *Eriomysticiformis*, *Phalanopsis cornu-cervi*, and, as a matter of course, *P. rosea*, with many of botanical interest.

Flowering in the Palm house are two beautiful climbers of the order *Malpighiaceae*, both with yellow flowers. They are *Thryallis brachystachys* and *Stigmaphyllon ciliatum*. The former has oval leaves, green above and white underneath. It flowers in large masses. A native of Rio de Janeiro. Peas and loam in equal parts may be used for its culture. Cuttings strike readily. *Stigmaphyllon ciliatum* is better known than the above; the flowers are larger, but fewer together; its branches are slender, and hang gracefully; the leaves are dark green, and ciliated with long hairs distant from one another. It is a native of Brazil, and will succeed with the treatment for the preceding.

Passiflora Munroi is one of the finest climbers in the temperate house on account of its handsome dark green foliage and beautiful sweetly-scented flowers. It is a hybrid between *P. alata* and *P. carulea*, the former being the female parent. In character the leaves are those of the latter, but larger. The flowers are intermediate between the two. It was described in 1868, and is worth the attention of all who do not already possess it. *P. alata* is flowering in the Palm house, and is also handsome, it is nearly allied to *P. quadrangularis*.

The *Asters* are commencing to make a show in the herbaceous ground, and of them there is a large collection. *A. Shortii* is the finest now in flower, it is about 4 feet high, and is loaded with large, finely-formed, lavender-coloured flowers. *A. turbinellus* is very distinct and good, the stems are slender, and the flowers large. *Frankia grandiflora* is an excellent autumn-flowering herbaceous plant; it has beautiful light green foliage, and pure white flowers of good size, valuable for cutting. *Hypericum patulum* is rare and elegant, one of the finest for borders. It was figured in the "Botanical Magazine" for 1868, where we are informed that "it is a native of Japan, where it was discovered by Thunberg ninety years ago, and was introduced into Kew by Mr. Oldham, collector for the Royal Gardens, who, after making many valuable botanical collections, perished of fever on the coast of China." The flowers are large, $1\frac{1}{2}$ to 2 inches in diameter, and freely produced. The stems are reddish, and reach a height of about 2 feet. It is quite hardy. *Salvia arustifolia* is a handsome blue-flowering species from Mexico. It has neat and distinct foliage, and is worth cultivation from the late period of its blooming.

FERNS AS WINDOW PLANTS

IN No. 699, page 165 of the Journal, "F. I." says that he has brought Ferns from the Isle of Man and other places, but could never get them to live more than one season. The

reason to me is plain, and that is, he has neglected to provide them with congenial soil. Unless attention is paid to this essential I do not wonder at his non-success. For example, the *Scelopendrinums* and *Polypodiums*, which grow so freely in North Lancashire, grow on a limestone formation, and if I do not procure a sufficiency of soil with the roots, I mix lime-rubbish rough-casting from houses will do amongst the soil when potting; this, and taking care to keep the outside of the pots clean, will preserve them alive and luxuriant for many years. A seven-years-old *Scelopendrium* which I have now has upwards of one hundred fronds upon it, grown in a 6-inch pot, and will keep green and luxuriant through the winter.—BETA.

This Show, which was held on the racecourse at Northampton on the 15th inst. in connection with the County Agricultural Society, was a marked success. Stove and greenhouse plants were unusually good for the season, Mr. J. House of Peterborough taking the first position; but it is the cut flowers, and especially the Roses, which we are induced to note.

The liberal schedule of prizes for Roses had evidently been prepared in view of a favourable autumn for the queen of flowers, and the result proved that the Committee had made "a gold," the display of Roses having been rarely, if ever, equalled previously in the fall, auguring well for Roses in the concurrent Exhibition now being held at Lyons. Messrs. Paul and Son appeared in good force, coming to the front in both the leading classes of twenty-four and twelve trebles, having good blooms of *Princess Beatrice*, which has proved a leading show Rose this year; *Madame George Schwartz*, *Charles Lefebvre*, *Alfred Colomb*, *Madame C. Craplet*, *Baroness Rothschild*, *Fisher Holmes*, *Paul Neron*, and *Maréchal Niel*. Mr. Prince, who arrived late, was a good second in both classes, and in his usual colour; indeed, another hour for arrangement might have turned the scale in his favour. Mr. House, who had evidently suffered more than his competitors from the heavy rains of the previous Wednesday, had otherwise fine flowers, and was third. Mr. Perkins of Coventry also showed well. In the classes for gentlemen's gardeners and amateurs Mr. Laxton and Mr. Whittle of Leicester were first with good twelves, the former also being first in the class open to both. Teas were also well shown, Mr. Prince being foremost. We noticed in this class clean blooms of *Maréchal Niel*, *Catherine Mermet*, *Triomphe de Rennes*, *Niphotos*, *Belle Lyonnaise*, *Madame Océle Berthod*, *Madame Caroline Kuster*, *Cloth of Gold*, and *Narcisse*. In new Roses Messrs. Paul were first, and "The Shah," who appeared in glaring scarlet, took the post of Honour.

There was a large and good competition in Dahlias, Mr. Walker of Thame taking the lead. *Asters* were remarkably fine, the two stands of French shown by Mr. Laxton, who was first in both classes, being particularly good. Mr. Walker also showed well, and Mr. Tranter of Henley amongst amateurs, Mr. Walker being first in the Globe quilled class. Table decorations were a feature, and with the bouquets filled a large tent; Mrs. Turner, the Mayoress of Northampton, and Mrs. J. Phipps exhibiting much taste in the arrangement of a group of three pieces and a centrepiece, with fruit and flowers for the dinner-table.

Fruit, with the exception of Grapes and Pines, which were not so well shown as might have been expected in so favourable a locality as Northamptonshire with its numerous resident landed proprietors, was good. Amongst Apples, Messrs. Brown of Stamford showed their new seedling *Peasgood's Nonesuch*, very fine and highly coloured. Red *Astrachan*, *Franklin's Golden Pippin*, the Irish Peach Apple, *Quarrenden*, and *Reinette Blanche d'Espagne* were also nicely coloured and good. Pears, with few exceptions, were not ripe.

In vegetables, Broccoli and Onions were well shown, but, as a rule, the Potatoes were coarse. Altogether the Show, which was contained in seven large marquees, was a decided success, and creditable to the management.

ELECTION OF ROSES.

I PROCEED now to give to the readers of "our Journal" "the state of the poll," but first a word or two on the utility of this election. On the one hand I have had letters considering it unnecessary, whilst on the other I have received regrets that the election was not extended to other flowers. Apart from both of these classes, I have met during the past year with an example of a class for whom this election was specially intended—*viz.*, those fond of gardening and who are lovers of Roses, but who can from various circumstances only grow a certain moderate number. The gentleman had long been

known to me by name, being the father of a very dear friend of mine, but this year a personal meeting between us took place. I was not aware of his gardening propensities, and was astonished, after we had chatted on other matters, by his remarking, "I am sure we are all very much indebted to you." I looked aghast, I could not understand what was coming, but it turned out that it was for "the election of Roses" in "our Journal." And then he kindly enlarged on the topic, adding that he waited for the election before "deciding on the Roses he was going to order." Here was then an unexpected testimony to the usefulness of the work. I have thought over it and taken courage whilst reading replies urged against its utility. To the Rose exhibitor it is not comparatively of much use—it is more a matter of curiosity how our favourites will stand, but to this class of lovers of gardening it is very important. A word, too, on the electors. It would be a great thing could we insure that none should vote who were not thoroughly qualified to exercise the right. On the face of it this sounds well, but it is very difficult to accomplish. Is there to be "a competitive examination" for electors? It had crossed my mind to try something of the kind, but to get those who really possess the knowledge to give us the information they possess in black and white is not so easy; at least, I have failed in getting several to give us their opinions, and the reasons are so diverse it seems hopeless to reconcile them. One says the number asked for is too great; the next replies, The number is so small, better say a hundred. For myself I cannot understand the apathy of the trade in assisting such elections. One fancies it ought to increase the sale of Roses. Does it, perhaps, make too great a run on the good ones? Any way, one regrets the absence of the names of some of the "giants" in Rose culture; but as we cannot carry out the "no compulsion, only you must" system, we are obliged to be content.

One word more. I think we all ought to deal leniently with the different fancies of Rose-growers, which make them often call different Roses the most beautiful. Only think what a serious thing it would be if men were not to have different fancies, and all to set their affections on the same woman. What an uncomfortable world this would be! So, as we are not at all likely to think alike, or even to see alike on all subjects, it seems to me both more Christian and more charitable to reason that such a voter has some good and sufficient reason for naming a Rose which we ourselves discard as utterly worthless. Our soils and climates are so various that there is much to account for our differences, and we need not disagree because we differ. Out of the fifty Roses that we each name, about two-thirds of us name the first thirty Roses on the list, and several of the remainder are accounted for by the eccentricities of our English climate, whilst the rest may be set down to the crotchets and fancies that cling even to Rose-growers. For instance: out of the nineteen nurserymen only two, Messrs. Turner and Walter, have named Roses all of which have been named by some other voter. All the rest have one or more in their lists named only by themselves, and curiously enough these two follow each other in my table. Of the amateurs, Mr. Burrell alone names Roses that all obtain votes other than his own.

It will be noticed that the replies number thirty-eight in all, and that by a curious coincidence they are composed equally of amateurs and nurserymen. This renders the return somewhat more interesting; and some Roses—as, for instance, *Maréchal Niel*, *Alfred Colomb*, *Prince Camille de Rohan*, *Souvenir de Malmaison*, and *Lyonnais*—have received the same number of votes from each class of voters, both as to quantity and quality of votes, and this in the three last-named is very curious.

I have adopted the same plan as in the general election, 1872, and kept the two classes of voters distinct. In the following table the first column designates the position of the Rose. Where the grand total is equal between two or more Roses their position is settled by the number of first-class votes—that is, the first twenty; if these are still equal, the Roses are bracketed together. Next follows the name of the Rose. The letters after the name show what kind of Rose it is. Then I have attempted to carry out a suggestion of Mr. Peach's, and added the name of the raiser of the Rose. Mr. Peach had nearly completed his own list in this manner. Mr. Pochin further assisted me, but several are still wanting. Column A denotes the number of first-class votes given to any Rose by amateurs; B, the number of second-class votes; C, the total of amateur votes. The letters with an * show the same

for the nurserymen. The last column is the total of amateurs' and nurserymen's votes added together.

Eight Roses obtained five votes each: of these Capt. Christy, Chesbunt Hybrid, and Devienne Lamy obtained some first-class votes. Sixteen Roses obtained four votes; fifteen obtained three votes; nineteen, two votes; and sixty obtained only a solitary vote.

When first this present election was mooted I received an

anonymous note from "SOUTH HANTS" begging me to get the returns filled up so as to distinguish the fragrance of the Roses. It is very difficult now to get the returns. To some persons I have written three times without any reply. I am, therefore, unwilling to increase the dilliculty; moreover, it must be recollected that most fanciers look at a Rose fifty times to once smelling it, and that different persons have different ideas of the fragrance of flowers, one liking a perfume that another detests; so that I cannot think it would be any very great addition. But "SOUTH HANTS" will see that I have not forgotten the matter, and provided there is an election next year that I am able to carry out, I have a scheme that I think will meet the case.

By the thirty-eight electors 212 Roses have been named as amongst the best fifty. Of these, amateurs have named 170 Roses, and the nurserymen 176; thus running very closely together. In the best twenty 107 Roses have been named. Here the amateurs have again named the smaller number—viz., seventy-seven; whilst the nurserymen name seventy-nine. Here, again, the two numbers are nearly equal. I doubt not a few of your readers will compare this election with that of 1872, published in Journal of December 19th. Everyone will remark that two Roses have rapidly come towards the top of the tree; these are Roses of 1871—Etienne Levet and François Michelin. The former obtained honourable notice in 1872, receiving four votes and high praise from some growers; the latter, however, was not mentioned at all. They now rank respectively ten and thirteen. I cannot but think François will get higher. In shape it is to my mind superior to Etienne Levet, and it will be noticed that all the nurserymen have voted for it. Madame Bellon, President Thiers, and one or two others noted in 1872 seem to have disappointed expectation.

Four Roses are named by all, though two of these have some second-class votes. Four others lose only a single vote, and my curiosity is excited to discover why they are not named by the voters who have passed them over. In previous elections I have returned some papers, asking if such and such an omission were an oversight. I now think this is scarcely a fair plan, and I have allowed the lists to remain. Marquise de Castellane and Gloire de Dijon have retrograded, but both these Roses have a very large proportion of first-class votes. Edward Morren, Marquise de Mortemart, and Maurice Bernardin have also materially gone down. All votes for Louise Peyronny have been given to Lælia. There is a difficulty about Ferdinand de Lesseps and Exposition de Brie; and, again, Beauty of Waltham and Madame Charles Crapelet, Mr. Cant specially giving his votes for one or other of these. It must be confessed there is a great similarity between them; but here we do find this difference between the two former—that Ferdinand is by far the more robust both in constitution and growth. This, probably, accounts for the change that has taken place in their position as compared with 1872. The magnificent colour of Xavier Olibo has placed him in the best twenty; for it will be noticed that in the list he stands No. 19, but receives only two first-class votes from each class of voters. As an instance of the different value set upon two Roses by the two sets of voters, compare Marie Rady with Marguerite de St. Amand. With me the former is always kind, the latter has never given me a good bloom. All the nurserymen, save one, vote for the latter; all the amateurs, save one, vote for Marie Rady.

Of the comparatively newer varieties I collect these opinions. We have heard and read Mr. Camm's opinion of Madame Lacharme (the Rose I mean, of course), in these pages, that she was "a mockery, delusion, and a snare;" my experience coincided with his. Mr. Beachey says, "What a vile lot of rubbish last season's Roses are! Madame Lacharme the dirtiest, most frowy-looking French madame I have come across for a long time. I have never yet seen her with a clean face. I pity Mons. Lacharme if the original suggested the name on this account! All the rest of the French Roses have a hungry hollow look, as if they had helped to pay the German war indemnity, and in so doing had got quite sucked-out! Claude Levet, Mrs. Veitch, and Marins Cote appear to be the most respectable." Now, on the other hand, Mr. Burrell writes, "Madame Lacharme I have placed in the first twenty. It has been good here from cut-back plants, but indifferent on maiden plants, and I fear is an uncertain Rose, but as a nearly white Rose I think should take the first place." And Mr. H. May, of the Nurseries, Bedale, says, "From what I have seen of Madame Lacharme under glass, I consider it a gem" (the italics are mine), "it will become a great favourite for forcing,

every plant however small producing magnificent blooms with the greatest certainty. The Duchesse of Edinburgh, judging only from her appearance in an exhibition stand, must become a favourite, and Mr. Bennett may well be proud of her. She has only three votes from nurserymen, two of them being first-class; but one other nurseryman, though he does not place her, says he thinks "very highly" of her. Capt. Christy secures five votes, and one hopes it will prove an acquisition. Madame Auguste Verdier is again named by Mr. Harrison; and another nurseryman, who does not vote for it, says that procured from Mr. Harrison he is exceedingly pleased with the Rose. The Rev. E. N. Pochin says of it that he believes it is Madame Eugène Verdier revived. My recollections of this Rose are great endurance of colour, and this is one of the points Mr. Harrison mentions.

After the returns were complete and calculations made, I received from head quarters an election conducted by a gentleman in the north—Mr. Bewick, of Whalton, Morpeth. There are nine voters all in the district, but the returns of two of the voters are incomplete. This rather militates against the value of the returns. Still it is interesting as coming from the north, and giving us the value of Roses in that locality. The number of Roses to be named was twenty-four, and in all seventy-four are named. The twenty-four Roses that received the greatest number of votes and the votes that each Rose received are as follows:—

Alfred Colomb	9	Marquise de Castellane....	5
Charles Lefebvre	9	Louis Van Houtte	5
Madame Rothschild	8	Abel Grand	4
La France	8	Comtesse d'Oxford	4
Pierre Notting	8	Exposition de Brie	4
Duc de Rohan	7	Souvenir de Malmesdon....	4
Scutateur Vaisse	7	Duke of Edinburgh	3
Marie Baumann	6	Ferdinand de Lesseps	3
Madame Charles Crapelet ..	6	Etienne Levet	3
Gloire de Dijon	6	Marie Rady	3
Madame Victor Verdier.....	5	Paul Neron	3
John Hopper	5	Comtesse de Chabillant ..	3

Maréchal Vaillant and Maurice Bernardin also poll three votes each, thirteen obtained two each, and no less than thirty-five only a single vote. What I am chiefly struck with in this election is the fact, that in a limited district with the soil and climate probably more similar, there should yet be such diversity of opinion that thirty-five Roses should receive only one vote each. With more than four times the number of voters, and twice the number of Roses, the general election only has sixty-nine single votes. We most of us would notice with wonder that Maréchal Niel is not in the twenty-four named; shall I add to it by saying it is not in the seventy-four? Seeing that Climbing Devonensis has two votes, we wonder the Maréchal does not do with some sort of protection. Duc de Rohan's position astonishes me. With all it is a shy bloomer and decidedly tender, still very beautiful.

I have, in conclusion, to return my warmest thanks to all who have so kindly assisted me in carrying-out this election. Without their help it would have been a miserable failure; as it is, I hope it may prove both useful and interesting to the many readers of "our Journal." Especially I gratefully acknowledge the assistance of the Revs. C. P. Peach and E. N. Pochin, without whose valuable help I could not have made the list of the raisers' names as complete as it now is.

Next week I hope to give the full lists, and also a summary of the votes looked at from a different point of view—viz., North v. South.—JOSEPH HINTON, *Warrminster*.

THINGS OUT OF SEASON.

I wish to tell Mr. W. Taylor that at this date (September 20), I have Roses in prime condition for the button-hole on Elise Boëlle and Gloire de Dijon, dwarf plants, as many as sixteen buds. Lord Macaulay and Duchesse de Morny are producing most beautiful blooms. For scent Elise Boëlle is perfection, and for colour Lord Macaulay. Christine Nilsson has also several buds in various stages.

Now for Strawberries. May Queen is now fruiting for the second time this year in the open air; Perpetual Pine in bloom for the first time. Last October I got from a nurseryman plants of Le Gros Sucré, Vicomtesse Héricart de Thury, and Marguerite. I potted them for forcing. The plants not being good enough for the purpose, although housed through the winter, did not bloom or fruit. The pots were turned out in May into the open air, and in June were plunged into the soil. Le Gros Sucré and Vicomtesse Héricart de Thury bore

beautiful fruit all through August; Marguerite did not till the present month. On the 16th I gathered some dozen or more berries of first-rate flavour and good size. At this date the plants are one mass of bloom and fruit in various stages.

Fastolf Raspberry has given fruit on the young wood this month of full size and excellent flavour.—W., *Norwich*.

BATTERSEA PARK.—No. 1.

WHEN the ornamental grounds at Battersea Park were first laid out, and that masterly hand which now lies paralysed and helpless gave an impress of such novel grace and beauty, and of such great merit withal, that its method has since been resolved into a distinct system, the fame and merit of the work became so widespread that the name of Gibson was upon every lip, and all were eager to see and learn something of that which all so justly united to praise. This general and enthusiastic admiration was doubtless caused in the first instance by the bold and novel character of the work. To convert a low-lying, flat, unwholesome waste into an ornamental park affording ample scope and liberty for the enjoyment of healthful recreation by all who chose to avail themselves of it, was most praiseworthy, and of immense benefit to people residing in the immediate neighbourhood; but it was the garden, both in its formation and after-management, which soon attracted and fixed the attention of horticulturists. Bold mounds and hillocks clothed with shrubs and trees, and grand masses of rocks, dispersed at some parts and as skilfully connected at others, formed sheltered sunny nooks, enclosing spaces of considerable extent without the slightest formality of aspect, but with graceful flowing lines and sweeping curves on all sides, agreeably intersected by walks; and then when upon these enclosures appeared numerous beds of simple form, in which the denizens of our stoves were seen flourishing with a vigour not often equalled in the stoves themselves, it became evident that a master had arisen among us to whom we must render the full meed of homage and admiration which his works so richly deserved, and of whom we would willingly learn the lessons which he so ably taught.

After the lapse of a few years the question naturally arises, How has the work stood the test of time? The answer is, Admirably. Battersea grows yearly in beauty; and it is matter for congratulation that the fine appearance of the whole of the gardens and park this season affords ample evidence that Mr. Roger is indeed an able successor to Mr. Gibson. Yes, the subtropical garden at Battersea is in great beauty this season; the beds are well filled, the plants are in perfect health and in full vigour; but what to my mind is of even greater importance is the exceedingly good taste in which they are arranged. Now, it would serve no useful purpose to describe the arrangement of every bed or group of beds, and I think I shall best serve the interests of your readers by confining my report to the most remarkable beds—to those arrangements which amateurs, and therefore gardeners generally, may hope to imitate successfully, and to a descriptive list of new or desirable bedding plants.

On each side of the central river entrance to the subtropical garden there are two pretty arrangements in circular beds of about 6 feet in diameter. The edges of these beds, in common with all the others, have no abrupt ramps, but rise in a softer rounded form to the higher surface of the bed. On these sloping sides of the two beds to which I allude were two rows of *Sempervivum californicum*, with a band of Golden Feather *Pyrethrum* inside, enclosing a couple of *Alternanthera amara*, out of which springs a central plant of *Yucca recurva*, with five of the quaint-looking *Aloe nitraformis* in the form of a circle equidistant from each other as well as from the *Yucca* and *Pyrethrum*. In the garden, first comes a novel arrangement in the form of a mass of silvery variegated *Geranium*, admirably relieved by a judicious intermixture of small plants of the bright green Japanese *Thujopsis dolabrata*. For edging, this bed has a broad band of succulents, consisting of two outer rows of the flat silvery rosettes of *Echeveria secunda glauca*, to which the next row of *Aloe cymbiformis*, with its green, rigid, erect, and pointed foliage, forms a capital contrast; inside this is a narrow belt of Golden *Pyrethrum*. This was strictly a foliage bed, and as such was very good, or otherwise I would have preferred a neat row of blue to the yellow of the *Pyrethrum*. Another novel bed, which had an exquisite effect, had an edging of *Mesembryanthemum deltoideum* enclosing bands of *Alternanthera magnifica*, *Lobelia speciosa*, and white variegated *Geranium Sylph*, with a mixed centre composed of groups of

golden bronze *Geranium* and some of the bolder succulent forms, charmingly interlaced with the familiar old *Koniga maritima*, with plants of *Acacia lophantha* kept to single stems and springing gracefully upwards some 2 or 3 feet at intervals above the other plants.

Here is another bed, a circle, to which I would particularly call the attention of amateurs. Its edging was also of succulents, consisting of two rows of the pretty *Echeveria pumila*, then one row of the very distinct and striking *Aloe attenuata*, with thick, erect, sharp-pointed green leaves, thickly spotted with small white protuberances; then two rows of the indispensable Golden *Pyrethrum*, two rows of the very fine grey-leaved *Cineraria maritima compacta*, with a grand central mass of the bright crimson *Coleus Verschaffelti Improved*. This bed in the exquisite neatness and evenness of its surface has been brought to a pitch of perfection that is absolutely wonderful, not a leaf appearing to be misplaced, nor was the slightest indentation or irregularity visible upon the surface. Here, again, are a pair of circular beds with a precisely similar arrangement in both, and placed as they are at the two extremities of various beds of tall and stately plants, they have a charming and striking effect that is admirably in keeping with the important position assigned to them. The edging of these beds was composed of three rows of the alpine *Sempervivum montanum*, a hardy and very beautiful variety, having the foliage disposed with such precision that each plant presents the appearance of an exquisitely neat rosette. These three rows formed a somewhat broad and conspicuous band, which was separated from a circle of *Kleinia repens* by another of the very beautiful Hungarian *Sedum glaucum*; inside the *Kleinia* is a broad band of the beautiful golden-variegated *Coprosma Baueriana variegata*, containing some narrow oval-shaped patches of *Alternanthera magnifica* disposed all round at regular intervals; then comes a row of the grey-leaved *Centaurea compacta*, enclosing a fine central mass of pink *Geranium*. These two beds are in such excellent taste, that I heartily commend them to the attention which they merit. I did not learn the name of the *Geranium*, but would recommend Pearson's Florence Durand as one of the best pinks I have seen this season.

In striking contrast to such beds I may take one of an oval form containing a carpet of scarlet *Geranium*, out of which spring four huge plants of *Wigandia caracasana*. This central mass was enclosed by a band of *Funkia subcordata* and *Chamaepeuce diacantha*, with an edging of *Sempervivum californicum*. Such combinations of a few simple plants are within the reach of most persons wishing to form a conspicuous group in any quiet, sheltered, sunny nook. The *Wigandia* has a most stately appearance, and the contrast of the spiny-leaved *Thistle* against the dark green foliage of the *Funkia* is very effective. In another oval there was the best example of a band of *Echeveria secunda glauca* I have ever met with; it consisted of three rows of small even-sized plants placed so closely together as to cause the leaves to turn upwards with a pretty and striking uniformity. Inside it was a band about 6 inches wide of the bright-coloured *Alternanthera magnifica*, behind which came *Lonicera aureo-reticulata*, rising abruptly about 9 inches in the form of a hedge, enclosing a central mass kept to a uniform height with it of the pretty *Vitis heterophylla variegata*, out of which at intervals of 2 feet spring fine plants of *Grevillea robusta pyramidalis*. By the use of plants of graceful habit as the *Grevillea*, not only is all heaviness of appearance avoided, but a high finish is imparted such as could be obtained in no other way. Mixed beds are a severe test of skill and good taste. Of many fine and very successful examples here I may select a pair of circular masses, containing a large central group composed of *Cannas*, Variegated Maize, and *Gladioli*, surrounded by bands of yellow *Calceolaria*, pink *Geranium Fairy*, with an edging of the huge-leaved *Sempervivum ciliare*, the plants of which were quite a foot apart, and yet the foliage had met and intermingled. *Cannas* predominated in the centre, with just enough Maize and *Gladioli* to light-up and relieve it in the best way. There was very little bloom upon the *Geraniums* and *Calceolarias*, and their growth had become wild and mingled, but to my mind the effect in this particular instance was much better than if they had been laden with the brightest flowers or kept strictly to a formal outline.

But my report grows beyond the bounds of a single paper; and as there remains much which cannot be passed over—much that is alike instructive and interesting—more lovely combinations which fully exemplify the power, grace, and

beauty of those deep rich tones, and softer shades of colour, of which I have so long been an earnest advocate—new plants that are little known, and among which lovers of the flower garden will find such varied beauty and sterling merit as will in reality create an *embarras de richesses*, I must defer the remainder till next week.—EDWARD LUCKHURST.

COMPARATIVE GROWTH OF TREE FERNS.

The following paper on the comparative growth of tree Ferns, read by Dr. Moore of Glasnevin at the recent meeting of the British Association at Belfast, will not be without interest now that indoor ferneries are getting so much in vogue, and tree Ferns so much in request for them:—

Considering that well-authenticated data concerning the nature and rates of growth of tree Ferns would possess a certain amount of interest, I have arranged some notes made from time to time on this subject on kinds which have come constantly under my observation. At the beginning of the period I purpose to review there were only very few of those beautiful plants introduced to Europe, and even yet the number cultivated in collections is few compared with those which are now known and described. The idea which is generally entertained concerning those plants is that they grow very slowly, and that the stems of them, which are brought to this country from their native habitats, must have taken a great number of years to attain to the heights of 10 to 12 feet, which are about the largest sizes that are introduced. I have, however, been able to prove that the growths of several of the kinds are by no means so slow as they are supposed to be. We have grown at Glasnevin one species from a spore to a height of 10 feet in less than twenty years. It was, however, one of the most robust and quickest-growing among the Australian and Polynesian species, the *Cyathea medullaris* (Swartz). When the late Dr. William Harvey visited some of the Polynesian Islands in 1855, he sent to Glasnevin a small packet of the spores of that Fern, or rather the variety of it, which differs from the normal New Zealand form in having more slender fronds, with their ultimate pinnae more divided, along with several minor differences, which have led authors to consider it a distinct species from the New Zealand plant. It is the *Cyathea Mertensiana* of Bongard, which the late Sir William Hooker, in one of his last works, "*Synopsis Filicum*," treats as a mere variety, differing slightly from the normal type.

A few plants were produced from the spores sent, one of which was grown on as rapidly as possible until 1872, when it had attained a stem 10 feet long in seventeen years. At this period of its growth, owing to some inexplicable cause, it turned sickly, and gradually dwindled away until it died during the present year. There is yet a fine example of the New Zealand form in the Glasnevin collection, which is historically interesting, from being one of the first batch of seedlings of this species raised by the late Messrs. Loddiges of Hackney, about the year 1844. Another of the same lot perished in the conflagration which took place at the Crystal Palace a few years ago. I have no exact note of the time it came to Glasnevin, but suppose it must have been in 1845, when it was very small. It is now a noble-looking Fern, with a strong stem 11 feet high, and fronds from 8 to 10 feet long. These examples afford us a tolerably correct idea of the sizes the stems of this species attain within thirty years. The next species I have reliable information on is that which is generally known in collections as *Alsophila excelsa* (R. Brown), but which I have reason to suspect is *Alsophila Cooperi* (Hooker). There are certainly two very distinct species in the Glasnevin collection under the specific name *excelsa*, the common Australian kind, and that from Norfolk Island. The latter was grown from spores collected by the late Mr. John Veitch, taken from plants growing on Norfolk Island, and there are also plants in the same collection raised from spores taken from the fronds in the Kew herbarium, from which the late Sir William Hooker described his *Alsophila Cooperi*. I can see no difference between the latter and plants sent from Australia by my brother, Mr. C. Moore of Sydney, as *A. excelsa*; but there is a great difference between them and the Norfolk Island plants brought by Veitch, which may be the true *A. excelsa* of Brown. The first plant of the Australian kind was sent in a Wardian case to Glasnevin in 1850, when it had no woody stem, and the fronds were only about a foot long; it has now a beautiful clean stem, nearly 12 feet in height under the fronds, which it has made within the last twenty-four years. I have also been able to observe the growth of *Dicksonia antarctica*, from a seedling upwards

to a rather large stem. The plant was obtained in 1840, when it was only about 8 inches high, including fronds; and now it has a strong thick stem, fully 5 feet high from the surface of the tub in which it grows to where the head of fronds is. These instances, therefore, show that some of the Australian and Polynesian kinds of tree Ferns make their stems quicker than has generally been supposed to be the case. There are, however, others of them which, so far as my experience concerning them extends, grow at a much slower rate. One healthy plant of *Alsophila australis* (R. Brown) at Glasnevin was obtained when a seedling in 1850; and although it has continued strong and healthy ever since, the rhizomatous stem is only now taking an upright direction. Another plant of the same species, which has been cultivated nearly as many years, has only begun to form an upright stem lately; and it, too, has continued healthy throughout. A further instance is afforded of the slow progress many of those plants make during the earlier years of their growth, from a plant of *Cyathea dealbata*, which was obtained in 1855, and has grown vigorously ever since; yet the woody stem has only begun to form within the last eighteen months. Those, and other similar examples, lead me to believe that many kinds of tree Ferns make slow progress until their stems form and take an upright position; after which they grow much faster, until they attain a height of 12 or 14 feet, when the growth becomes slower and more consolidated. The observations I have had opportunities of making on South American tree Ferns are confined to a few species.

During the year 1858 the Hon. Judge O'Reilly, then residing in Jamaica, sent us from thence small plants of *Cyathea arborea* (Smith), and *Cyathea aculeata* (Willdenow), in a Wardian case, when they were without hardened stems. They soon began to grow vigorously, and the former has now a clean stem 13 feet high, the latter has one 5½ feet high, which they have made in sixteen years. Examples of the slow increase in height of Fern stems after they attain a certain height have been afforded by both Australian and South American kinds. Among the latter I may mention a fine plant of *Cyathea serra* (Willd.), which came to Glasnevin in 1862, from Lady Dorothy Nevill's collection at Dangstein, when it had a stem nearly 15 feet high. It has continued in good health ever since, but it has hardly increased 3 feet in twelve years. Among the New Zealand kinds, fine plants of *Dicksonia squarrosa* (Swartz), and *Cyathea dealbata* (Swartz), were obtained in 1868, with stems 6 and 8 feet high. They have both continued in good health ever since, yet their stems have scarcely increased a foot in length in six years. To contrast with these, I may mention a plant of the beautiful *Cyathea princeps* (J. Smith), which has made a stem nearly 7 feet high within fourteen years.

The foregoing observations have been made upon plants growing in conservatories to which the public are daily admitted, and, consequently, the atmosphere must necessarily be kept in a much drier state than is favourable to the healthy development of those plants. I have the experience of some fine examples of several of them which are growing in Dr. Hudson's splendid fernery near Dublin at present, and also those of Mr. Bewley's, where in both cases the atmosphere is kept close and moist, and with more shade, under which *régime* they make quicker growth in a given time than they do in the drier and more exposed conservatories at Glasnevin. The foregoing notes have not, however, been arranged for horticultural purposes, but simply to afford some reliable data on the progress of the growth those plants really make, about which one hears so many mythical conjectures respecting the great age of their imported stems. I shall, therefore, not enter farther on the horticultural consideration of the question; but, before concluding, I may state my belief that one-half, at least, of the many fine examples which have been imported during the last twenty years or so have perished, owing to their being too freely exposed at first, and placed in situations unsuited for them. If they once get thoroughly checked by being too dry at the roots or stems, they seldom recover, but gradually lose their fronds and die off.

In summing-up these brief observations, I have first to state that some of the kinds of tree Ferns grow with greater rapidity, and form their stems in a much shorter period than is generally supposed to be the case. Secondly, After they attain a certain height, the scrogeous buds are formed much closer together, the one above the other, than they are lower down on the stem, hence their elongation is much slower. Thirdly, Some of the sorts which at first form short rhizomatous stems, before they

take an upright position, require a considerable number of years to perfect the early part of their growth; but after the stem has been formed, and an upright position taken, the growth is much quicker and the elongation advances rather rapidly, compared with what it did while the stem remained in a rhizomatous state.—(*Irish Farmers' Gazette*.)

FLOWERS FOR OUR BORDERS.—No. 40.

ABELIA UNIFLORA.—LARGE-FLOWERED ABELIA.

OUR scientific botanists are not, it must be admitted, always happy in their choice of names for the various novelties brought under their notice, and the *Abelia uniflora* is a case in point. Its specific designation, *uniflora*, would, of course, suggest the idea that the flowers were produced singly, or but one on each footstalk; it appears, however, that the peduncles

Fig. 80.—*Abelia uniflora*.

are generally two, and not unfrequently three-flowered, as an inspection of our figure will show.

It is an evergreen shrub of somewhat slender habit, the branches partially decumbent. The leaves are broadly lance-shaped, pointed, dark green on the upper surface, but pale beneath. The flowers are produced from the axils of the leaves, and, as already stated, vary in number from one to three on each peduncle. The corolla externally is white tinged with pale purple, with a yellowish throat, and resembles in its form that of many plants of the order Scrophulariaceæ, especially some of the *Pentstemon* family.

It is, however, a member of the Honeysuckle family (*Caprifoliaceæ*), in which small order it is closely associated with the handsome *Diervillas*, now so common in gardens, and better known under their early name of *Weigela*. It is one of the numerous introductions of Mr. R. Fortune from China, by whom it was sent some twenty years since to Messrs. Standish and Noble, of Bagshot.

Its cultivation is unattended with any difficulty; it thrives in peat and loam, and may be increased by cuttings of the half-ripened wood; like the other *Abelias*, it is benefited by occasional "stopping." In the open ground it flowers about July.

The *Abelias* are named in honour of Dr. Abel, a physician who accompanied Lord Amherst on his memorable embassy to China.—(*W. Thompson's English Flower Garden, Revised by the Author.*)

PREFERABLE STRAWBERRIES.—A correspondent asks for the experience of others as regards Dr. Hogg. I grew it several

years next to British Queen, but finding no superiority, not even in hardiness, I have discarded it. In selected lists I miss *Myatt's Filbert Pine*. This I have found better than *Pro-more Late*, though it has two defects—1st, it is loth to throw out runners; 2ndly, its fruitstalks require support.—G. S.

NOTES AND GLEANINGS.

At the Botanic Garden, Oxford, the Mexican *DASYLIRION ACROTRICHUM* recently threw-up a flower stem which, when 12 feet high, grew at the rate of 6 inches in twenty-four hours. *Nelumbium luteum* (the Sacred Bean) is reported this season as producing perfect seeds.

—THE *Building News* says that "the Pottery Tree of Para is one of the curiosities of Brazil. The stem does not exceed a foot in diameter, and it grows to the height of 100 feet. But the peculiarity of the tree does not consist in its configuration, but in the nature of its wood and bark, which contain so much silica (pure flint) that they are used by potters in the production of earthenware vessels. The bark contains more silica than the wood, and in preparing the bark for the potters' use it is first burnt, and the residuum is pulverised and mixed with clay. An equal quantity of the two ingredients produces a superior ware. The fresh bark cuts like soft sandstone, and when dried it is brittle and difficult to break." We readily believe the statement, for chemical analysis has shown that the outer bark of the Bamboo contains more than seventeen per cent. of silica.

—THE collection of Orchids which belonged to the late Bishop of Winchester, Dr. Sumner, and two other collections, were sold on the 17th and 18th inst. by Mr. Stevens at his rooms in King Street. There were 518 lots, and they realised £612. *Dendrobium glumaceum* was sold for £14 3s. 6d., and *Dendrobium filiforme* for £25 4s.; *Angraecum eburneum superbum* for £24 3s., and *Laelia anceps Dawsoni* for £17.

—AN "Annuaire de l'Horticulture Belge" is announced as soon to appear.

—THE first FUNGUS EXHIBITION HELD IN SCOTLAND, was opened in Aberdeen on the 18th inst. The idea of the Exhibition was first suggested by the Rev. Mr. Ferguson of New Pittligo, in the "Scottish Naturalist" for April. The suggestion was readily taken-up by fungologists and men of science, and the result was an Exhibition which gentlemen entitled to speak with authority say was never equalled in this country. The specimens numbered about seven thousand. Almost every county in Scotland made large contributions, while England and Wales sent a number of exhibits. In fact, almost every fungologist in Britain contributed specimens. A considerable proportion of the Fungi belonged to the larger classes, such as *Agarici*, *Boleti*, *Polypori*, &c.; but there were also large collections of microscopic Fungi, and very important additions to the British flora. Several species of Fungi new to science were exhibited, and some splendid specimens of *Sparassis*, which is very rare, were to be seen. Several fine specimens of *Fistulina hepatica*, *Polyporus sulphureus*, and *Phlebia radiata* were much admired. There was a specimen of *Helvella gigas* from Heathcot, near Aberdeen, a species only once before known to have been found in Britain. Among the edible Fungi was an enormous specimen of *Lycoperdon giganteum*, which had been gathered at Fetterneer, in the north of Scotland, numerous specimens of *Cantharellus cibarius* and *Boletus edulis*. Several specimens of fossil Fungi, which are very rarely found, were exhibited. An excellent collection gathered on Moncreiff Hill, and sent by Sir Thomas Moncreiff, included a fine specimen of *Sparassis crispa*. Another prominent specimen of the same was included in a valuable collection from Huntly Lodge.

THE POWDER-WINGED MOTH.

ALEYRODES PROLETELLA.

THE insects belonging to the genus *Aleyrodes* are curious little creatures, occasioning some perplexity, not only to the gardener, but also to the entomologist, by the appearance they present. Though often called moths, as above, they are also called "flies" by some folks, while others have confused them with the aphides. In truth, however, we might say they are "bugs" of a sort, since they belong to the order Hemiptera, though they fall into that section which comprehends the Psylla and the aphides, and are no very distant relatives of the scale insects or mealy bugs. The perfect insects of *Aley-*

rodes must be acknowledged to be pretty objects as they display themselves on the leaves when the day is calm, their beauty being brought out fully to view by a hand-magnifier. The gardener, however, is aware that if not so troublesome as the aphids, they are no friends of his, and their minute size makes it more difficult to deal with them. Though they resort at times to the lofty Oak, they do not disdain under certain circumstances the culinary Cabbage, and various plants and trees afford them a comfortable abode besides these extremes. But as compared with the abundant aphids, the Aleyrodids are rather uncommon insects, though in this season I have seen many parties of them about, for they delight to associate in groups on the "happy family" principle. They are kept under by parasitic enemies. A *Cynips* kills many of them, and also an *Acarus*. Nor are these all, we may presume; at least it is only in that way we can account for Aleyrodes having fewer representatives than aphids, for if let alone it has been found by an ingenious calculation that a father and mother can in one year boast of a posterity of two hundred thousand individuals, and, according to the observations of Reaumur, these insects can bid defiance to the cold, and go through all their changes in winter as in summer. He found larvæ and pupæ, as well as imagos, in December and January; but I do not think in Britain it has been their usual habit to proceed beyond the end of autumn in their round of life, when they break off and the imagos usually die, and as it would seem the species is continued into another year by eggs that are hatched in the spring. It is possible that the increasing mildness of our winters may make this and other insect pests much more lively than they used to be.

Aleyrodes proleptella, the Cabbage visitant, and the best known of this small group of insects, is about one-eighth of an inch long in its imago state. Without a very minute examination we can see that this insect has not the paps or abdominal appendages noticeable in the aphid tribe, though the grey or powdery appearance causes a marked resemblance to some species of that division of the Homoptera. An Aleyrodes has wings that are almost devoid of nervures, the fore wings having but one passing along the centre; the hind wings are small in proportion. These are all placed in a triangular form when the insect is in repose, and besprinkled with a powdery substance, as also are the rather long black legs. Whether this serves to protect the Aleyrodes from the weather, or deters some of its enemies from approaching it, is to be regarded as doubtful; the powder may answer both ends, and it is produced in quantity sufficient to be not only on but about the insect as it moves along the leaves, which it does with great deliberation. One peculiarity observable in the head is that the eyes are as it were divided in the middle, making it look as if it possessed four of these organs. The familiar "whirl-wig" beetles (*Gyrinus*) have eyes of similar aspect.

The juices of plants are obtained by means of a rostrum or sucker, which is folded beneath the body when not in action. Though *A. proleptella* has been seen on different plants throughout the summer and autumn, it is in June and July that the females have been detected in the act of egg-laying, the patches containing about a dozen, environed of course with the powdery exudation, but not usually covered by the dead body of the parent, as in the scale insects. The young Aleyrodes, however, almost immediately after it bursts the shell grows a sort of scale over itself, under which it advances in a very tortoise-like way along the under side of a leaf, where it might easily escape notice as seeming an object devoid of life. This larva has a short rostrum like the parent, and six pectoral legs. There is a true pupa state intermediate, when the Aleyrodes is attached to the leaf without moving, and covered by the rejected skin of the larva.

The extirpation of the species of Aleyrodes is sometimes difficult, because the plants they are found upon cannot frequently be fumigated. Hand-picking of the infected leaves, unless done by a practised hand and eye, results in the missing of many of them; fortunately these insects are rather disfigurers of plants than serious garden pests.—J. R. S. C.

THE SUGAR CANE

(SACCHARUM OFFICINARUM).

If we were asked which article of food is the most generally approved we should name sugar. In all ages, in all countries, and at all periods of life saccharine substances have been and are desired. One of them was of the two products of the Promised Land held out as specially acceptable to the Israel-

ites: it was to be "a land flowing with milk and honey." There is reason for believing that the Sugar Cane became known to them, for Jeremiah and Isaiah both speak of "the sweet Cane from a far country;" and they probably received it from the same country that afforded them their favoured spice, Cinnamon—namely, the East Indies. The very name Cane is of Hebrew origin. *Kaneh* is the Sugar Cane in that language, whence came the Latin *Canna*, and thence our English name.

Nearchus, Alexander the Great's admiral in the eastern seas, brought the Sugar Cane thence to Europe in the fourth century before the birth of Christ; and three centuries later Varro speaks of an Indian Cane of large size from which was "expressed a liquor sweeter than honey." Theophrastus mentions it as "the honey in reeds." Piny also describes sugar, and says the best is from India. These authorities convince us that the Sugar Cane is a native of the East Indies. From thence, as we have noted, it was brought to Europe, and seems to have been made known to England by the Crusaders. The Cane was cultivated in countries adjacent to the Holy Land, and the cultivation lingers still in Sicily and Andalusia. Our word sugar is of Arabian derivation, for in Arabic it is *suechar*.

There are three varieties of the Sugar Cane cultivated in India. 1, The Purple-coloured, which grows well on dry land. 2, The Pale Yellow, requiring richer soil; this Cane is sold in the Calcutta bazaars and eaten raw. 3, The White Cane, preferring a swampy soil, and by far the tastiest variety.

The China Sugar Cane was considered by Dr. Roxburgh a different species, and was named by him *Saccharum sinensis*. There are also in various parts of India varieties known by the local names of Puttaputti, Maracabo, &c.; but the writer, when in India and seeing the specimens, thought the distinctions trivial.

The ryots consider the Sugar Cane, and also the Beet Plant, in a sacred and superior light; they even place it among the number of their deities. The first fifteen days of Koar (or September), termed Peetereputch, are devoted by the Hindoos to religious ceremonies and offerings on account of their deceased parents, relations, and friends. Such of them as have been bereft of their parents refrain from every indulgence during the said period, as being the season of mourning and mortification; and as they deem the performance of the higher rites of their religion (such as making offerings of sweetmeats, cloths, jewels, &c., in the temples of their several deities, and also the sacrifices denominated Hoom-jugg, &c.), a pleasure and enjoyment, these are likewise carefully avoided.

The sacred appellation of the Cane amongst the ryots is *Nag' bele*; and hence, for the reasons above stated, the immediate owners of the Cane plantations sedulously refrain from repairing to or even beholding them during the continuance of the Peetereputch. On the 26th of Cartick (or October), termed by the ryots *Deuthan*, they proceed to the fields, and having sacrificed to *Nag' bele*, a few Canes are afterwards cut and distributed to the Brahmins. Until these ceremonies are performed according to the rules of established usage and custom, no persuasion or inducement can prevail upon any of them to taste the Cane, or to make any use whatever of it.

On the 25th of Jeyte (or May), termed the *Desharah*, another usage is strictly adhered to. As it is usual with the ryots to reserve a certain portion of the Canes of the preceding year to serve as plants for their new cultivation, it very frequently happens that inconsiderable portions of Cane remain unexpended after the said cultivation has been brought to a conclusion. Wherever this happens to be the case the proprietor repairs to the spot, and having sacrificed to *Nag' bele* (as before stated), he immediately sets fire to the whole, and is exceedingly careful to have the operation executed in as complete and efficacious a manner as possible.

The cause of this extraordinary practice proceeds from a superstitious notion of a very singular kind. The act is committed from an apprehension that if the old Canes were allowed to remain in the ground beyond the 25th of Jeyte they would in all probability produce flowers and seed, for the appearance of these flowers they consider as one of the greatest misfortunes that can befall them.

Although the Sugar Cane is a native of the East Indies, and thence became known in Europe, yet we believe it is a native also of South America. Sugar is chiefly imported into this country in the state of raw sugar, and molasses or treacle. From the molasses a considerable quantity of crystallised sugar is obtained in this country, and the uncrystallisable portion then remaining constitutes what is called treacle. Raw

sugar is purified by the process called sugar-refining. This process consists in dissolving the sugar, neutralising the acid with lime, boiling it with bullock's blood or a substance called finings, consisting of hydrate of alumina and sulphate of lime ;

passing the syrup through a stratum of animal charcoal to remove the colouring matter, concentrating the decolourised syrup in a vacuum pan, putting it to crystallise in conical moulds, and removing the last portions of colouring matter by

Fig. 81.—THE SUGAR CANE.

allowing a solution of pure sugar to percolate through the conical masses or loaves.

Gerarde tried to grow the Sugar Cane in his Holborn garden, but he stated in 1597, "Myselfe did plant some shootes thereof in my garden, and some in Flanders did the same, but the coldnesse of our clymate made an ende of mine, and I thinke the Flemmings will have the like profite of their labour."

The first sugar refinery of which we have any notice was at Dresden, where it was in 1597, and the refined sugar was called "blanche powdre." Yet loaf sugar was known much earlier, for in the town records of Lyme, in Dorsetshire, one of the events of 1553 was presenting to Mr. Waldron of Bovey House a sugarloaf weighing 7 lbs., costing 13*d.* per pound, equal to more than 3*s.* of our present currency. Sugar was

then imported by the Bristol merchants from St. Lucar in Spain.

1872 there were imported into the United Kingdom of sugar unrefined, 13,892,560 cwts.; of refined sugar, 1,787,515 cwts.; and of molasses, 698,590 cwts.

FLORICULTURAL CERTIFICATES.—At the last meeting of the Royal Horticultural Society's Floral Committee at South Kensington Mr. Fraser gave notice he should propose at the next meeting, October 7th, that something should be done to give first-class certificates more weight than has hitherto been the

case, more especially with plants that gain a first-class certificate by a unanimous vote and are of superior merit. There cannot be a doubt that some new method is much needed; and as the subject is of great importance to the horticultural world, I trust the Committee will meet in full force at the next

meeting to discuss so really important a subject.—E. BENNETT, *Hatfield, Herts.*

PEAS FOR SUCCESSION.

IN variety and number Peas are absolutely bewildering. Annually the number is being increased by new ones which the descriptions inform us are great advances on older kinds, casting over them a gloom which the raiser and vendor trust, no doubt, will prevent the keen eye of purchasers penetrating. If there is anything so likely to keep the new ones in favour, it is the extravagant price at which they are "let" out. Fancy having to pay 5s. for a half pint of Peas—a pound per quart! and then only to grow them a year for seed; living in expectation, feeding the eyes a year, the teeth being kept well-nigh two years watering, in the hope of determining some time what they are like. The new things coming-out annually, and certificated as they are in most instances by the Royal Horticultural Society, are enough to make anyone's teeth water; but the price is such as to make many an amateur of limited means examine his pockets in the vain search for the needful. Considering the small quantity and the price, are we to wonder that the new things are a long time in supplanting the old? and when we add the faint hope of testing the quality the first year, as Peas must, if to be had in quantity the next, be retained for seed, who can doubt the amateur's judgment in abstaining for a year or two from purchasing the novelties? In a year or two it will be known what they are, the price per quart will not be more than an eighth or tenth what it was the first year, and I might as well save myself the price of seed, the ground, and the annoyance of seeing but not being able to come to a satisfactory practical test of their palate-satisfying qualities. We do not question the propriety of such reasoning, it is every-way commendable in those of small means; but were all to be of their mode of thought, it is certain the novelties would not come nearly so thick and fast. The rage for novelties is so great, that high as is the price asked for them, the supply is not equal to the demand. Everybody in these times is so desirous of not being behind in the march of progress, that at any sacrifice he must have the things which it is well known always lead. We cannot, however, be in the world and not in the fashion; we may, however, depend upon this—viz., whether we are in or out of the world of fashion, we shall find that esteemed most valuable and best which affords the most lasting enjoyment, and this is as applicable to the appetite as to any of the senses. It is this which induces many to cling to old things which have given long unqualified satisfaction; their ideas are wedded to "never-will-be-beaten," which so blinds some that they (from their faith being pinned to old things), do not set a proper estimate upon things of value coming-out yearly. In this way they lose or deprive themselves for a long time of things of merit, which it must be acknowledged we have in new Peas, as we have in other subjects. I do not think anyone would care to return to the Early May for a first early, Emperor for second, the Marrows and Marrowfats (Wrinkled Marrows), for main crops. Talk of old things being best! always, please, except Peas. Dr. Hogg tells us in the "Year-Book," 1873, what all the known kinds of Peas are. I hope to see every kind of vegetable gone through in the same way. It is the best means to an end, the selection of the most productive and useful sorts.

I am led to these remarks from a reflection that I have grown a great many sorts this year—in fact, every year since I came to make out a seed order (over twenty-one years), and have a result just the same as I knew an old gardener had then, and said he had had every year for nearly sixty years previously—namely, a dish of Peas without fail every day from the early part of June to the early part of October, and occasional dishes in May and November, rarely in December. The kind grown then was Dillistone's Early. The fifty-years practitioner had to give way to fashion, the Early May was given up. Just a row on a south border that might be 50 yards long was considered enough. Early Emperor was the mainstay for early Peas; Early Green Marrow to succeed; Woodford Green Marrow, Dwarf and Tall Marrows for successional and late crops, or six sorts in all. Peas there were every year in plenty, and obtained as easily as possible. Well-manured ground, well-dug, and of light soil was chosen for early crops, also warm spots; trenching or deep digging and throwing-up roughly in winter being adopted for the summer crops. The early sorts were sown November 5th to 10th, again the first mild weather in or after February, and when these appeared above ground the earliest

were sown again, and at the same time the second earliest. The next crop was the second earliest, and then a crop of each, and afterwards the main crop, one crop succeeding the other regularly every ten days up to July, the last sowing being made in the first week. As to culture I do not find we have advanced, but I should be glad if any correspondent having a Pea named Salter's Tall Marrow would have the kindness to send me a few seeds through the Editors. This is a tall Marrow (wrinkled slightly), which my memory tells me is not surpassed by any in cultivation, either in cropping or quality.

Now this old man was everlastingly running down the new and praising sky-high the old. Wonder it was he every year ordered the new things. He knew very well (before he had them, mind) they were no use; but then they did to show visitors, to send in whenever anyone staying at the hall lauded up some new kind, insinuating that the old sorts were nowhere in comparison, when he would send in the actual thing unknown. All the new things were sent-in in that way, and if they were not noticed he used to say they would do if they cropped as well as the old, or if better, well—we must try them again; but if there was the least complaint either from cook or high quarters, no matter what the cropping was, they were thrown overboard. Many a time have we extolled a new kind not known at table, not even by those loud in its praises. "Keep a keen eye upon that which is most esteemed at table, and grow those things which serve it best and longest."

It is very interesting, certainly, to test new varieties, but they take up room, and stop very few gaps in the vegetable supply. Good as are the new things it is long before they supplant the old. Of Peas we have over 110 kinds without synonyms, and out of this number we can with at most half a dozen meet every demand. We want early Peas, second crops, and later crops.

Early kinds were for many years restricted to the small white sorts; but of late years we have had some valuable additions in blues and greens, both smooth and wrinkled. Ringleader, the true Dillistone's Early, is unquestionably the earliest, or was—I say was, because I had it surpassed this year by Blue Peter, but under rather unequal conditions. Ringleader, Emerald Gem, and First and Best were sown on a south border January 13th, ends of rows north and south, and on January 28th Blue Peter and Little Gem 18 inches from the wall and parallel to it. Blue Peter was ready at the same time as Ringleader (June 23), the first dish, in fact, taken off Blue Peter as the pods of Ringleader were in pod and pea comparatively small. Emerald Gem was fit to gather at the same time. Little Gem, though a Pea of very good quality, is simply nowhere; I had it seven to ten days after Blue Peter. I had the last in pots sown January 15th, and had the first dish April 21st, growing them in the second Peach house. Little Gem, sown at the same time in pots, was nowhere. First and Best was a week later than Emerald Gem and Blue Peter, the last being grown under slightly advantageous circumstances; but First and Best is a much better cropper. Blue Peter grew with me 2 feet high, and was wonderfully prolific. In pots it was dwarfier than Little Gem.

As a first early I shall this year give my vote for Blue Peter, 2 feet, for warm positions, for which its height admirably adapts it. For first and second early Alpha, a blue wrinkled sort, 4 feet; general crop Fillbasket, a grand cropper, 3 feet; Jersey Hero, 3 feet; Best of All, 3 feet; G. F. Wilson, 4 feet; for late, Premier and Ne Plus Ultra. But I have got eight kinds, which I will reduce to six, and in the order of sowing as follows:—

Sow November 5th to 10th, and December same dates, in a warm position, Blue Peter and Alpha.

Sow first open weather after middle of February, Blue Peter and Alpha.

Sow a fortnight after the above crop has been put in, every fortnight up to the beginning of May Alpha, Fillbasket, Best of All.

Sow beginning of May every fortnight up to July 1st G. F. Wilson and Ne Plus Ultra.

Note.—Fillbasket or Best of All to be sown at the same time as the first sowing of G. F. Wilson and Ne Plus Ultra, and Alpha must be sown once when Fillbasket and Best of All are first sown, it being discontinued at the sowings afterwards, as Best of All is in the later sowings.

All are wrinkled Peas except two—viz., Blue Peter and Fillbasket. Neither is so good for flavour as the others, and yet both are grand Peas, Fillbasket especially for cropping, and it will on that account be a great favourite for general growers and market. I take a prospective view, and think we shall

have all we want for early in William I., 3 feet; second early Fillbasket, 3 feet; general crop Best of All and G. F. Wilson, 3 feet and 4 to 5 feet respectively; late crop Omega, 3 feet. Omitting Best of All the four remaining will give us all we need, and yet we may strike out Fillbasket, substituting William I., and we have three kinds of moderate height, not like some which require hop-pole-like sticks, with flavour unsurpassed. Were Fillbasket given the flavour of G. F. Wilson, retaining its height, 3 feet, we should have in William I., Omega, and the one to come perfection in Peas. Another season may upset our ideas, but present experience prompts my considering the above result will be shown.

Tall Peas I have not alluded to. They have as a rule large peas and pods, but they do not give a correspondingly greater yield for the ground occupied. Two rows of Fillbasket may be grown on ground that will only suffice for one of Superlative, and one row has this year given me six times more of Fillbasket than of Superlative. Superlative has never shown merit, and why it should have a first-class certificate, and be in any way commendable beyond its extraordinary pod, is past my limited comprehension. In tall Peas we have some good kinds. Berks Challenge is a grand Pea, Emperor of the Marrows also good, and Ne Plus Ultra is simply unapproached as a late kind; but it will be a great gain if Omega give us the good qualities of Ne Plus Ultra at a height that will only need stakes 3 feet above ground. We shall be able to have two rows where we can at present have but one, and at once get over the difficulty of procuring tree-like sticks, and save much annoyance, as the 3-foot kinds are not so liable to be injured by wind. I had great faith at one time in the tall Peas, but later experience has convinced me that a 3 to 4-foot Pea is in every way more desirable than one of 6 to 7 feet.

The best cropping Peas that I have grown or seen are, for first early, First and Best; second early, Fillbasket, which will answer for main crops as well as Best of All; Jersey Hero (Mammoth Dwarf Marrow) and James's Prolific Late, G. F. Wilson, and Ne Plus Ultra. The last two produce the crop successively, but the others have it nearly all fit to gather at the same time, and are all the more valuable on that account for market, as the ground can be cleared and employed for other crops much sooner than if long in use.—G. ABBEE.

LITTLE HEATH MELON.—I was fortunate enough to win the £5 prize offered by Messrs. Carter & Co., at Bath, in the company of some eleven exhibitors. My opinion of the quality of Little Heath I had perhaps better keep to myself, but I must inform Mr. Meacock, however much he thinks of Little Heath, that his opinion is not a general one; but my Victory of Bath has solved the great problem of pleasing everybody.—R. GILBERT.

NOTES ON VILLA AND SUBURBAN GARDENING.

THE FLOWER GARDEN.—The blooming season is fast passing away, and most plants give signs of the approach of autumn; therefore, in order to prolong the beauty of the flowers as much as possible, every decayed leaf or flower should be taken away, and the beds kept dressed in the neatest manner. In beds where two or more distinct colours are used keep each one to its proper place, and let the outlines of each be regular and well defined. The law, too, which adds so much to the beauty of a garden, ought to be frequently rolled and regularly mown, and it will look as green and fresh as it does in spring.

Finish the propagation of all bedding plants except Calceolarias, which may with advantage be deferred, and use every effort to get them established quickly. It is not well, however, to treat bedding plants of the ordinary kinds too tenderly at this time of the year; if so, they are more difficult to keep through the winter. If any are growing in frames let them have plenty of air night and day, and while the weather is warm set the frame up on something so as to be clear of the ground, that a current of air may pass under as well as above the plants; this prevents the appearance of mildew, which so frequently attacks and destroys Verbenas and Cinerarias, and whenever seen its progress should be arrested by the application of a pinch or two of powdered sulphur.

Carnations that have been layered in the open ground will now be well rooted, and should be separated from the parent plant. The best of them may be potted; the next size may be at once planted out, and the smallest or weakest plants should be put into what is called a nursery bed—that is, pricked-out close together in a somewhat sheltered place where they can have a little protection from cold during the winter. No doubt there are many suburban gardens where this pretty flower would be an acquisition; I will, therefore, enter into some details of its

cultivation. I shall assume as a matter of course that plants have been raised from those which produce the best flowers only. Those that are selected for potting will do well indeed in a soil composed of two-thirds loam and one-third cow manure twelve months old if possible, but if this is not to be had thoroughly decomposed hotbed manure may be substituted; mix all well together in a dry state if possible. The plants will not need large pots at first, probably what are called large 60's, or 34 inches over and about the same in depth, will be the sort required. The plants may be firmly potted, and afterwards transferred to a frame and kept a little close for a few days, which will induce root-action. When they have become so far established, gradually give more air to them, and in a week or two they may have the lights thrown entirely off them night and day. They do not suffer from a little frost, but they ought to be protected in the most severe weather, and kept as dry during winter as is consistent with health. If too damp, mildew attacks and destroys them; therefore at every opportunity air must be admitted, and if possible the foliage should be well dried during the day. The plants will be much benefited by being cleaned two or three times in winter of their decayed leaves, and the soil on the surface of the pot stirred up with a small stick. The ground on which the pots stand should also be stirred and cleared of worms, some fresh coal ashes added, and the plants replaced. I might here mention that all kinds of plants that are wintered in frames should be at times taken out, cleaned, and replaced in a similar manner.

In spring, say about March, the plants may be planted out either in the borders or in a bed by themselves, where they will not fail to create a pleasing feature. The bed should be deeply dug, and if possible some fresh soil added, with good manure; plant them not less than 18 inches from plant to plant, press the soil firmly around them, and water well at all times in dry weather until they flower. Very little attention but that of hoeing the soil frequently to keep down weeds will be needed. When the flower stems show themselves they must be secured to small stakes, otherwise the habit is to be rather loose, and, moreover, the wind plays sad havoc with them when left to themselves. When the buds show themselves prominently the small and ill-formed ones should be taken out, leaving those most promising and perfect. Sometimes, just as they burst into bloom, the buds split down on one side or other, and the flower, instead of being perfectly formed, is ill-shaped, and does not look well; when there is a sign of this taking place a piece of matting or some soft sort of material should be tied round the bud about two-thirds of the way up, which prevents the splitting complained of.

Carnations may be, and are, often raised from seed, but at first there is such a quantity of worthless flowers among them, and this is only seen after much trouble has been spent on raising the plants to the flowering point, that those who want to make sure of a first-rate flower should purchase half a dozen varieties that will be sure to please.

At this time of the year the little *shrubberies* in connection with the garden will need some attention in the way of cutting the gross shoots away so as to keep the plants in shape, though it is not necessary; neither do I like to see shrubs cut out of their natural habit nor trimmed very closely, but if they are not occasionally attended to they are apt to run up high, and leave a nakedness at the bottom which is very objectionable in any garden, especially in a small one where every plant is required to give the best possible effect.

Now is the time also to examine and decide upon those shrubs to be moved where there is overcrowding, and also for the purpose of determining any alteration that can be made for improvement by a re-arrangement.

Roses may still be budded if more are required, but not after the month is out; the buds will no doubt remain dormant through the winter, and shoot with great vigour in the spring. Those who have room may sow a few pots of Mignonette to keep through the winter for early spring-flowering. This plant does not like transplanting, therefore it is best to sow the seed in the pots in which the plants are to flower.

Now is a capital time to have all repairs done that are required upon the greenhouse or any other structure whether large or small, and all painting and glazing completed, so as to have everything in readiness to protect the stock of plants when cold weather comes on.—THOMAS RECORD.

DOINGS OF THE LAST AND PRESENT WEEKS.

KITCHEN GARDEN.

THERE are very few gardens that can be kept tidy all the year round, and the present is the time when otherwise well-managed gardens are apt to assume a somewhat ragged appearance. Weeds grow quickly, and not only are they unsightly, but if not taken off the ground in time they will leave a supply of seeds which will keep the hoes at work all next season. We have been hoeing fruit-tree borders, Sea-kale quarters, Coleworts, sprouting Broccoli, and wheeling the weeds off the ground. The

kitchen garden may be made quite as attractive as any other part of the grounds, but neatness should prevail everywhere. When Cabbages, Cauliflowers, Lettuce, &c., are cut over the stocks should be forked up at once, and carried to the vegetable mould heap; this heap should be in the least frequented part of the grounds, and hidden from sight by a sufficient screen of evergreens. The English Yew, from its dense growth, is perhaps the best subject to plant for this purpose, although Arbor Vitæ, Broad-leaved Evergreen Privet, and any plant of a similar character will answer. The last-named will succeed in almost any soil and situation, and it also grows very rapidly. The vegetable refuse from a large garden accumulates in a year to a very large heap, and where manure is scarce it comes in useful as a dressing either for flower borders or kitchen garden quarters. Our early garden experience was gained in a situation where the gardener could only have manure at the discretion of the bailiff, and nearly all the farmyard or stable manure that found its way to the garden came in the form of horse droppings for the Mushroom house, which, after being spent there, were generally used on the flower beds. In this place every bit of refuse convertible into manure was valuable. A large quantity of leaves raked up in the pleasure ground was added to the heap in the autumn and winter months. A tank which received the drainage of the farmyard was also emptied on the heap once or twice a-year, and though the kitchen garden received scarcely any manure except from this refuse, excellent and plentiful supplies of Potatoes and all other vegetables were produced.

FRUIT AND FORCING HOUSES.

Pine Houses.—It is difficult to say what character of soil is best for potting Pines. We have not been so successful with our plants since a clayey loam which was used for this purpose can no longer be obtained. Our own loam is from a very light sandy soil, and full of fibre; in it the plants grow freely, but the pips do not swell up satisfactorily, which would lead one to suppose that the potting material had become exhausted before the fruit appeared; and yet a very successful Pine-grower told us the other day that the soil he uses is very light sandy stuff. Another successful cultivator pots his plants in peat soil. One thing ought to be noted, and that is that Pines do not show the result of injudicious treatment so readily as some other fruits, but very probably the plants suffer quite as much, and will at last show the result in producing very inferior fruit. We filled one of the beds with loam, to which a sixth part of stable manure was added, and in it the suckers which were potted in August have been planted out. The bed is sufficiently drained, and is also provided with hot-water pipes underneath. Very large Providence Pines, some of them weighing over 15 lbs., were produced at Gunnersbury; the plants were put out in beds, and brick divisions erected between each plant.

Where young succession plants have been newly potted or planted out, it is desirable to shut-up the house early, say 3 p.m.; the thermometer should not fall below 70° at night. In the fruiting house a little air is left on all night both at the front and back.

Peach Houses.—The only attention early houses require is to remove decaying leaves. A good drenching from the garden engine answers two purposes: it removes all loose leaves, and at the same time cleanses those that remain on the trees from red spider and other pests. Late houses are now also destitute of fruit, except some of the latest Peaches. Salway is very well worth growing; it is the latest of the freestones, and though sometimes woolly and deficient of flavour, it never fails to make a good show on the dessert table, the fruit being large and rich-looking. It is not so well adapted for pot-culture as Lady Palmerston, which is also ripe two or three weeks before Salway. Both sorts ought to be grown where fruit is required late in the season. Another variety not so well known as it ought to be is Desse Tardive. This is a finer-looking fruit than either Walburton or Late Admirable, and is rather later.

Mushroom House.—We can go out into the fields and gather excellent Mushrooms just now, and many others can do the same; although the ground is very dry large specimens have been gathered. With an inch or two of rain and mild weather this wholesome esculent would be obtained in quantity from meadows and grass fields. However, there are many places where no Mushrooms are produced naturally. Manure should now be ready to make-up a bed in the house. Our own experience suggests that about a third part should be cow manure, and a little turfy loam added is an improvement. A bed made-up as suggested will not heat violently, and will continue in bearing much longer than one composed only of stable manure. We have had heaps of stable manure, loam, and cow manure in equal proportions that have produced most excellent Mushrooms without any spawn being inserted in the usual way from bricks.

GREENHOUSE AND CONSERVATORY.

The houses which up to this time have been gay with what are termed softwooded plants, are now to be cleared-out for the summer occupants. Old plants of Fuchsias, Zonal Pelargoniums, and indeed the whole section of rapid-growing plants, may be cut-up for the rubbish heaps rather than that the

vineries and Peach houses should be overcrowded with them. These structures have in nine cases out of ten to become store houses for the larger plants that will be required in the flower garden next year, and, being drier, are much better adapted for the plants than low damp pits. It is not safe to allow Heathas, Azaleas, Chorozemas, Statice, or, indeed, any Cape or New Holland plants, to remain out after this, unless they are in a position where a canvas screen can be drawn down over them at night, and to protect them from heavy rains as well; but in any case it is much better to have the plants under the glass. When plants are taken indoors, if a little judgment is not exercised, many of them may suffer, and some severely. Take the Camellia for instance. The plants have been in a shady position out of doors; the weather may have been showery, and the leaves of the plants have been wet night and day; even if no rain has fallen, the leaves are saturated with dew at night. The plants are taken into a greenhouse or conservatory, and if they are in flower little or no moisture is allowed; the atmosphere is dry, even parching. The leaves of the Camellia are dry always. The pots had been standing on the ground, the roots were always cool, which caused the formation of many tender white rootlets. Now the roots are on a dry stage, and surrounded by a dry warm atmosphere, even, it may be, to the extent of injuring the rootlets. The inexperienced cultivator may say, "Yes, that is just the condition of my plants; they were treated as described." Now the plants may show no signs of distress, the leaves will continue green and healthy-looking; but look at the flower buds in a month or so; the outer scales, which should be quite green, are becoming edged with brown, the buds do not swell, and presently drop off. Now, when the plants are taken indoors let the paths and stages be damped in the morning, and should the days be warm with sunshine bedew the plants overhead with a fine syringe. No other plant will suffer so much as the Camellia from the change; but many are attacked by mildew and red spider. Some species of Cape Heathas suffer severely from the former before it is detected; a quick eye is required to discern the evil, and prompt remedies must be applied, dusting with flowers of sulphur for mildew; laying the plants on their sides and well syringing with water will destroy the red spider.

Shaking out and repotting stage Pelargoniums; plants that were growing in 7-inch pots have the balls reduced to be repotted in 5-inch. The pots are well drained, and the potting material is turfy loam four parts, leaf mould one part, and a little rotted manure added to it. Removed Auriculas from a position under a north wall to a frame facing south; the lights are drawn off in the day, but the plants are not exposed to rain after this.—J. DOUGLAS.

GLOW-WORM IN THE NORTH.—I see in the chapter on "Beautiful and Useful Insects of our Gardens," the writer believes the glow-worm to be scarce in the north of England, and not often noticed in August, and quite exceptionally in September. This is not correct for Westmoreland, for here in the lake district we have an abundance of glow-worms, and we very rarely see them before September.—A READER OF THE JOURNAL.

TRADE CATALOGUES RECEIVED.

E. G. Henderson & Son, Wellington Road, St. John's Wood, London, N.W.—*Catalogue of Bulbs, Flower Roots, Roses, and Fruit Trees.*

S. Dixon & Co., 48a, Moorgate Street, London, E.C.—*Catalogue of Dutch and other Flower Roots.*

R. B. Matthews, 65 and 67, Victoria Street, Belfast.—*Descriptive Catalogue of Dutch Flower Roots.*

T. Bunyard & Sons, Maidstone.—*Select List of Dutch Flower Roots.*

John Harrison, Grange Nursery, Darlington.—*Descriptive Catalogue of Roses.*—*Descriptive Catalogue of Fruit Trees.*—*Catalogue of Flower Roots.*

W. Bail, King's Road, Chelsea, London, S.W.—*Retail List of Bulbs and Tuberos-rooted Plants, &c.*

TO CORRESPONDENTS.

* * It is particularly requested that no communication be addressed *privately* to either of the Editors of this Journal. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably.

BOOKS.—In answer to many inquiries, we can now state that the new edition of Hogg's "Fruit Manual" is passing through the press, and will be published in the course of a few weeks. This edition is very much enlarged, and will be printed on the same sized paper as "British Pomology," or what is technically termed demy octavo.

ACME FRAMES.—If "E. E., Berthamstead," will write to Mr. B. Looker, Kingston-on-Thames, he will receive all the information he requires.

ROYAL HORTICULTURAL SOCIETY (T. B.).—If your employer write to "The Secretary, Royal Horticultural Society, South Kensington, London," and tell his wishes, they will be complied with.

FRUIT SHOWS (An Old Subscriber).—Those at South Kensington, Regent's Park, and the Crystal Palace will be advertised in our columns. All fruit exhibited ought to be grown by the exhibitor. The Royal Horticultural Society's Fruit Show at South Kensington is to be held November 11th.

SEEDLING PEARS (J. Elliott).—The parent tree being grafted on a Quince stock will have no tendency to impart a dwarf habit to the seedlings.

GATHERING PEARS (W. J.).—The fruit of the varieties you mention, and, indeed, of all varieties, is fit for gathering when the stalk parts readily from the spray when the fruit is raised a little above a horizontal position.

FRUIT TREES FOR SOUTH WALL (R. L.).—Your wall will accommodate fourteen trees at 5 yards apart. You have six which are good, except the White Nectarine, which is too tender, being a shy bearer out of doors. We would have dwarfs for permanent trees, having standard Apricots, Peaches, and Nectarines between them to cover the upper part of the walls, cutting the standards away as the dwarfs advance and require the space. *Apricots*: St. Ambrose and Hensback; *Peaches*: Early Beatrix, Early York, and Dymond; *Nectarines*: Elrige and Edinaston Orange; *Plum*: Transparent Gage; and *Pear*: Glou Morceau, Josephine de Malines, and Winter Nodis are excellent, but they do not come in until December and onwards.

GRAPES SHRIVELLING (Notice).—We have no information as to the treatment. The roots are probably too dry. Water them copiously once or twice a week with weak tepid liquid manure.

ERRORS IN PLANTING VINES (W. G.).—We have committed a mistake in planting the vines. In the late house the two Pope's Hamburgh (Frankenthal) and Foster's White Seedling would have been better had they been the two Muscat of Alexandria and one Madresfield Court which you have in the early house. As the Vines have only been planted two years we should transfer those named from the early house to the late, and *vice versa*. It may be done carefully after the leaves fall, and they will not suffer to a great extent. The want of colour is probably due to overcropping, but may arise from a deficiency of water in the early stages of their growth and whilst swelling, or the Vines may have been deprived of too much foliage, or syringed to a late period with a deficiency of air. The "burning" of the berries is attributable to the atmosphere being too moist and the border being wet, it not having been duly supplied with water when the berries were swelling previous to stoning. Maintain a drier atmosphere with free ventilation.

GRAPES SHRIVELLING (M. Falkner).—Your Vines are evidently in soil unsuitable to them. There is a deficiency of root-action, and the remedy is, as soon as the leaves have fallen, for you to set about removing the soil from the border, preserving the roots of the Vines as much as possible, and making it afresh. This is the only cure.

VINES FOR INTERMEDIATE HOUSE (Old Subscriber).—The Vines will succeed tolerably well, especially as you have a border inside as well as outside the house. We presume that the Vines will be planted inside, and be rested by turning them outside, for which you have made provision. The kinds you have selected succeed each other; 7, White Chasselas we should not plant, but have Duke of Buccleuch; 6, Madresfield Court Muscat instead of Lady Downe's; 4, Venn's Black Muscat in place of Muscat Hamburgh; and the others as named. If you had another house or houses for Grapes we should have had two Venn's Muscat and two Madresfield Court, omitting Foster's White Seedling and Duke of Buccleuch.

SEMPERVIVUM TABULEFORME AND DOUBLE LOBELIA PROPAGATION (Linda).—The *Sempervivum* is propagated by offsets, but more readily from seed. Double Lobelia should, to keep it true, be continued by cuttings, which should be struck at once in gentle heat, or a few old plants may be potted and propagated in early spring in heat.

PEACH AND NECTARINE STONES SPLIT (Idem).—It arises from a defect of the seed, and is by some considered to be a consequence of deficient watering and keeping too warm during the stoning period. It is likely they may never exhibit the defect again.

PINE APPLES NOT TRUE TO NAME (W. H. E.).—The description you give accords well with the new Black Jamaica (Montserrat of some, English Globe, Brown Antigua, St. Kitts), but we could not form so meagre a description as you give say what it is with any approach to certainty.

STRAWBERRIES AND STRAWBERRY CULTURE.—In the fourth line of the second paragraph of the article on page 235, for "season" read *season*, and in the first line of the following paragraph for "occasionally" read *annually*.

PRICKLY COMFREY (Idem).—This, as a fodder plant, is not within our province. Full directions for its culture are in Baxter's "Agricultural Library."

NEW PLANTS (An Old Subscriber).—Send potted specimens of your Pelargoniums and of your Roses to the Floral Committee of the Royal Horticultural Society. If approved there you might dispose of your stock to some of our chief florists.

SCARBOROUGH LILY FLOWERING (Miss Y.).—It is unusual for this to flower twice, though the flower stems commonly succeed the different bulbs, which throw up the scapes according to the ripening of the growth and their formation. It will probably flower better another season. They do not usually flower strongly two years succeeding.

ZONAL AND NOSEGAY PELARGONIUMS (Idem).—There are Show or large-flowered, Spotted, and Fancy kinds of Pelargoniums, which are known as florists' flowers, and are defined in our "Florists' Flowers," which may be had free by post from our office for 4d. The Zonal Pelargoniums, which may be what you mean by florists' varieties, have the petals of nearly equal width—upper and lower broad and overlapping, so as to form a circular outline of large size, the fringes being smaller than the Nosegay, and the leaves are round. Nosegays have the lower petals much wider, often twice the width of the upper, and they do not meet, or indifferently, and so do not have a circular outline, but have a ragged or starry outline; the fringes are larger, often immense, and the leaves are more or less incised. They are all Pelargoniums, but from long usage are still called Geraniums, a name which belongs to another genus.

WINTERING BEDDING GERANIUMS (F. J.).—They would winter more safely in the boxes than potted-off singly in 3 or 4-inch pots at this season of the year, especially as they are to be kept cool. In the cold frame it is likely they will suffer from frost, but we presume you have means of safety from it. Pot them off early in March.

SPAN-ROOFED PIT FOR GERANIUMS, &c. (R. A. P.).—The 4½ feet we presume you mean for the centre height from the ground to the ridge, and

2½ feet the height of the side walls, which will answer very well. To keep out frost in severe weather you will need a pipe all round the house—a 5-inch pipe will be sufficient; even a 2-inch one would do if you could make sure of heating the water to a good temperature.

PRIMULAS (Droghda).—The author is a private gentleman.

PAILLIA (W. R. W.).—It is not a common form of flowering, but we have seen the form before, especially in dark flowers. It is very handsome. Send one to Mr. Keynes, Salisbury, and ask him his opinion.

OLD YUCCA LEGGY (J. M.).—It is likely that were the plant cut down it would start again a sucker from the base. We should, however, before doing so, wrap the stem with moss a foot down, commencing immediately under the leaves, and about 6 inches in thickness, securing it with string moderately tight, putting it on in spring, and keeping moist during summer, when by autumn it is likely the trunk will have emitted roots, and it may then be cut off below the mossed part, and be planted up to the leaves where desired. You may probably in this way save the old head, and secure suckers from its base.

ENCOURAGING BIRDS TO BUILD (Idem).—Old nests placed in the upper forks of the trees so as to imitate as nearly as possible natural ones in January or early in February, before they have begun to build elsewhere. It will not do to place the nests in the lower branches and indiscriminately. Place a good number in a tree, a dozen or more, a few in the next tree, and one or two in another. If the nests fail to induce the birds to build, secure a nest of about half-fledged young ones from the nearest rookery, and place them securely in a fork of a high tree and sheltered. The old ones feeding them, the young, if not the old birds, will return to the same trees to build their nests another year.

VARIOUS (Birdie).—Sweet Peas sown now in a light airy position in a conservatory will not flower during winter, but they would do so in spring and early summer. The Amaranthus and Love-lies-bleeding would, if taken up now with a goodly amount of soil and potted, keeping in a shaded position for a few days, and then in a light airy one, retain their beauty a long time; but the difficulty is to secure them with soil to the roots, and in that case the leaves droop and fall. The seedling Hollyhocks would be better wintered in a cold frame during the winter, planting out early in April; or you may plant them out if the soil be light now, affording them a slight protection of dry litter in severe weather. A dark-leaved edging plant is *Oxalis tropaeoloides*. The Rose you name will be likely to suit you; but we have no experience of it in such a position. Cuttings of *Gardenia radicans*, the young growth of the present year, will strike in gentle bottom heat. Being a stove plant it should be placed in house that will afford the requisite temperature—60° to 65° at night, and 70° to 75° by day.

PLEUROMA CULTURE (W. W. W.).—It requires an intermediate house—a warm greenhouse or cool stove—45° to 50° in winter at night, and 55° to 60° by day. Avoid syringing overhead, which causes the leaves to decay at the ends, and ultimately fall; but maintain a moist atmosphere during growth, a gentle syringing then doing no harm, and keep the soil moist, but avoid making it sodden. When the growth is made keep drier and well aired, watering only to keep the soil moist. The soil is right, two parts sandy peat to one of loam, with a few nodules of charcoal and broken pots, about a sixth of these, and silver sand, with good drainage.

MUSHROOMS DISAPPEARING FROM PASTURE (Hagley).—The disappearance of the Mushrooms is accounted for by the different depasture of the land. The dressing of salt every alternate year, and the grazing with horses and sheep were favourable to the Mushroom, but of late years you have grazed with cows, which are not so. Dress with the salt, and graze with horses and sheep, and you will in a year or two have Mushrooms.

WILD THYME ERADICATING (Idem).—There is no better plan than to apply nitrate of soda (1 lbwt. per acre), and manure heavily, keeping the grass for hay, and eating off the fog or aftermath with sheep. Every alternate year you may dress with salt, and with the mowing and high cultivation the Thyme would be overpowered and die out. We should sow white Clover at the rate of 12 lbs. per acre in April, after a dressing of manure. It would improve the herbage considerably. Snuckling Clover is also good for such a soil; 4 lbs. of it may be sown per acre, omitting 1 lb. of the white Clover.

LILIUM SPECIOSUM AFTER FLOWERING (A. M. A.).—Place the plants of *L. speciosum*, commonly called lancifolium, outdoors in a warm sheltered position, and if wet weather lay the pots on their sides, but not if fine, heavy rains being injurious; but it is necessary that the soil be moist. When the stems turn yellow cut them off, and turn the plants out of the pots; remove the part of the stem above the crown of the bulbs by twisting it out, and take away any soil that comes freely from the roots; then, after draining the pots well, return the bulbs to the same size of pot, or, if this is too small, to others a size larger, potting so as to have the crowns just level or a little below the surface, and 2 inches from the rim of the pot. The space left should be filled up level with the rim with the same compost as that used for potting, when the fresh growths are a few inches above the rim of the pot. The soil should be kept moist, any water required being given around the bulbs, and not poured upon them. Keep them in a frame or pit safe from frost during the winter. Equal parts of sandy peat, light loam, and leaf soil, with a sixth of sand will grow them well.

LILIUM SPECIOSUM (An Old Subscriber).—We are unable to account for the flowers of the red kinds being so small, whilst the white do well. What will grow one grows the other perfectly; but you may add a little more manure to the soil for the reds, and water with liquid manure when they are in free growth.

CELERY RUNNING (Idem).—Your Celery is running. It may arise from sowing too early, or growth being checked by cold or want of water. It may also result from sowing old seed, plants from which are apt to run to seed at an earlier season than those from new seed. It is not good to earth Celery a little at a time. It encourages the rising of the stalks as you describe. We do not earth Celery much—only a little to keep the leaves from falling, reserving the main earthing-up until three weeks for white, and a month for red, before it is required for use; but it is well to earth well up in October and onwards all the crops, so as to preserve the stalks from frost.

SAWDUST FOR BLANCHING CELERY (Sawpt).—It is a good thing for earthing Celery, placing it between the rows and around the plants after the leaves and stalks have been brought together, pressing the sawdust about them, so as to lie compact, and ensure blanching perfectly. It is better than soil, not being so liable to cause the stalks to rot, and is a good protection against frost.

CUTTING-DOWN MAIDENTHAIR FERNS (C. R. H.).—It is not desirable to cut down all the kinds of *Adiantum*, as some of them are evergreen, and should

only have the brown fronds removed as they occur. *A. cuneatum* is best kept rather dry in autumn, and all the fronds cut away at once before they start into fresh growth; or they may be removed as they become yellow, which is more tedious, and affords no better result.

FERNS FOR ROCKWORK (Rockwork).—As you propose to exclude frost, the following, which are mostly greenhouse kinds, would succeed. They are of moderate growth, and not costly:—*Adiantum assimile*, *Asplenium dimorphum*, *Blechnum occidentale*, *Davallia dissecta*, *Doodia aspera*, *Lastræa elegans*, *Lomaria l'Hermierii*, *Nephrodium molle corymbiferum*, *Nipholobos lingua corymbifera*, *Platyterium albidum*, *Platylova rotundifolia*, *Pteris cretica albo-lineata*, *P. umbrosa*, *P. serrulata cristata*, *Asplenium marinum*, *Adiantum Capillus-Veneris*, *Blechnum Spicaute imbricatum*, *Polypodium cambricum*, *Polystichum angulare proliferum*, *Wollastonia*, and *Scopolopendrium vulgare corymbiferum*. The last six are British. You would not be suited by creepers at the upper part, but you may have *Nephrolepis tuberosa* planted there, some of the fronds of which will hang down 3 or 4 feet, and have a fine effect. A good plant for covering any bare spots is *Ficus repens*.

FUMIGATOR (J. S. H.).—The best is probably Drechsler's patent, which is of various sizes; the largest size, 3½ inches diameter, would be best for your purpose. Tobacco is best—the leaf or cavendish cut up roughly; but good tobacco paper answers perfectly. It will not injure Orchids or Ferns, only the foliage, &c., must be dry, the floor of the house being moist; but of some subjects, for instance *Adiantum farleyense*, the fronds are injured by a very moderate degree of fumigation. The fumigator will be less likely to cause injury in proportion as the smoke is delivered cool.

PLANTING SEEDLING PERENNIALS (E. S.).—If well rooted they would be best planted-out in their blooming quarters early in October; but if the soil is not in good order, or the plants small, planting may be deferred until spring. The description of the seeds you name may be found in any seed list. We cannot undertake to describe "style of growth, period of flowering, best situation, &c.," of over sixteen subjects at a time. Annuals should be thinned to 3 inches apart; and plant from six to a dozen plants in a patch; biennials and perennials about 1 foot apart. *Salvia nemorosa* is also known as *S. sylvestris*.

PLANTING SIDES OF CARRIAGE DRIVE (Inquirer).—Under the shade of the Lime trees shrubs would thrive very indifferently. The best that we know are *Aucubas*, *Laurels*, *Butcher's Broom*, and *Periwinkles*, the latter giving a close green covering, and growing about a foot high. Ivy is also a fine ground covering. The best hedge would be *Thorn* or *Quick*, which in good soil and kept clean grows quickly and makes the best of fences. You may make a semi-evergreen hedge by planting a *Holly* every yard along with the *Quicks*—seven *Quicks* and one *Holly* per yard.

PLANTS FOR ENTRANCE HALL (Idem).—From the sketch we conclude that the roof is opaque, in which case it would not suit plants, except those near the windows, and not even these in winter, unless the house were heated. Could you not have the roof glazed, and the place heated by a hot-water boiler and pipes? Any danger of draught might be obviated by having a glazed entrance 6 feet long and 4 feet wide, so as to allow of a person shutting the outer door before opening the inner one. You have means of forming at a cheap rate a most excellent conservatory if you can glaze the roof, which we would suggest to you as far preferable to attempting to grow plants in what must be, without the glass roof, an unsuitable place.

INSECTS ON GLOXINIAS AND ACHIMENES (F. C. T.).—The plants are infested with thrips, which we are surprised is not destroyed by fumigation with tobacco; this cannot have been sufficiently powerful to destroy them, as we have not known efficient fumigations fail. No two fumigations will destroy them, for though it may kill all existing, they will leave behind them eggs, from which will proceed others. So long as the insects are present on the plants the fumigation should be continued, and this may be every week or fortnight, or oftener, until the pests are overcome, keeping a sharp look-out afterwards, and whenever an insect is seen fumigate. As you have such a plague of these insects, you must keep the atmosphere very much too dry. With increased moisture and fumigation they will be subdued.

HEDGE FOR SHELTER (E. M. S.).—Beech would grow well, your soil overlying chalk; but *Hornbeam* would grow more quickly, and it forms a good hedge, and is more twiggy. The Beech retains its leaves in a young state in winter, and is, on that account, more shelter-giving, but is very litery. Either would suit you. *Evergreen Privet* grows quickly, but would probably be too weak.

WEEDS ON LAWN (W. H.).—The three weeds you enclosed are evidence that the soil preparation they requires draining. No treatment will destroy them or prevent their recurrence as long as there is an excess of moisture in the soil.

APHIS ON LARCH (Alfred).—The shoot you sent us is infested with an aphid which is peculiar to the Larch, and unusually prevalent this season, it being, no doubt, greatly fostered by the drought. You have nothing to fear from it, as it will not injure the trees permanently. Wet, and the coming winter, will set them right.

GRUB (E. M. P.).—The grub is the Leather-jacket—*Daddy-longlegs*—larva, and very destructive. The best remedy is hand-picking; but we have known nitrate of soda, at the rate of a pound per square rod, applied with beneficial results.

PRUNING GOOSEBERRY TREES (Idem).—It is too early to prune *Gooseberry* and *Currant* bushes, and especially those raised from slips. Prune them as soon as the leaves have fallen.

CINERARIA AND CALCEOLARIA SEEDS GERMINATING (Idem).—There being so much dependant on the temperature in which the seeds are placed after sowing, it would be futile stating how long seeds of different kinds are in germinating. In a hotbed we have had *Cinerarias* up in four days, and *Calceolarias* in a week; whilst, without heat, about eight days elapse for *Cinerarias*, and ten days to a fortnight for *Calceolarias*.

NAMES OF FRUITS (Seabor).—The Pear is *Bonré d'Amanlis*, a good early variety. (*Inquirer*).—1, Dumelow's Seedling; 2, Pearson's Plate; 3, Eradick's Nonpareil; 4, Flower of Kent; 5, Sturmer Pippin; 6, Royal Pearmain. We cannot name fruits or flowers through the post. (*Dublin*).—1, Devonshire Buckland; 2, Pilmston Rosset; 3, Hawthornden; 4, Sam Young; 6, English Codlin; 7, Kentish Codlin; 10, Hawthornden; 11, Keswick Codlin; 12, King of the Pippins; 13, Keswick Codlin; 14, Gloria Mundi. (*J. Carpenter*).—1, Glou Morcean; 2, Gansel's Bergamot; 3, Winter Nellis; 4, Easter Bonnet; 5, Winter Nellis; 7, Fasse Colmar; 8, Hampden's Bergamot; 9, Vicar of Winkfield. (*S. J. W.*).—1, Fondante d'Automne; 2, Van Mons Leon Ledere.

NAMES OF PLANTS (R. H. W.).—We cannot name a plant from its leaves

only. (*B. T. J.*).—We cannot name mere florists' flowers, such as the varieties of *Begonias*. The other two specimens were finished. (*J. B.*).—*Hibiscus Trionum*. (*Clermont*).—1, *Gentiana asclepiadea* (white-flowered var.); 2, *Celtis australis*; 3, *Salix herbacea*. (*L. J. K.*).—1, *Anemone japonica*; 2, *Ecermocarpos scaber*. (*Wm. W.*).—Specimen insufficient. (*Rus.*).—Quite unnameable. (*Prima*).—1, *Hydrothamnus fasciculatus*; 2, *Abutilon venosum* (*Bot. Mag.*, t. 4453); 3, *A. megapotanicum*; 4, *Saxifraga sarmentosa*; 5, *Pessilora glauca*.

POULTRY, BEE, AND PIGEON CHRONICLE.

THINNING-OUT.

REALITY and imagination are very different things. We draw largely on the latter when we look at the broods as they come off in February, March, April, and May. We can see many winners, and all good ones. While we rock ourselves in these blissful anticipations, and determine to avoid the errors that had so often made shipwreck of our hopes and introduced us to grave disappointment, the time creeps on, and the little balls of fluff grow into awkward and lanky chickens. Still the time goes on, and different temperature, shortened days, and lengthened nights demand a change of treatment. But the change is a startling one from the thirteen "new comes" amply cared for under the hen, and the same number of great staring fowls that ask for board and lodging. If there were but one thirteen something might be done; as there are six thirteens something must be done. No amount of writing or talking will enlarge a roosting-house. It is known Henry V. of white-flag notoriety is slightly lame. When living at Frohsdorf his admirers were allowed to walk through the apartment as he sat at dinner, or to follow him at a distance when he took his constitutional. Two old marquises of the *ancien régime* were doing so, when one exclaimed to his companion, "My dear marquis, our prince has one leg shorter than the other." "*Maladroit!*" said the other, "they are uneven only because one is longer than the other." So we will insist the house is not too small, but the stock is too large. No difficulty now. How is it to be done? By eating or selling; by selling alive as stock birds, or as ordinary food. The good London wife retired into the country was asked, when her first hog was killed how she would have it cut up? She said, "All hams." And so our friend and poultry-breeder would have all his chickens prize birds. But it may not be. Whatever is done, it should be done at once. Procrastination in this instance is not only the thief of time, it is the thief of food. These birds are eating that for which they will make no return. You must decide how you will dispose of them. All we can tell you is, they must be sold. There is a pleasure in putting off a thing; it shows we are not compelled to do it. But Nemesis comes in the shape of the private Caleb Quotem. He says, "If you please, sir, you must increase my allowance." These growing fowls eat terribly. Now you must steel your heart. And after all, if you had room macy of them are not worth keeping—four-toed Dorkings, single-combed Hamburgs, crooked fowls of every breed; those that somehow never seemed to do any good, the extra cocks, the faintly feathered: all these should now be got rid of. Their food and their room should be given to those that will make a better return for them. If you are told your fowls are all too good to kill, do not believe it. We lately went into such a yard, and the two first selected birds put in our hand were both humpbacked. If you do not thin your stock now, if it is to be thinned at all, the inevitable loss will be your own choice.

ARMLEY AND WORTLEY POULTRY SHOW.

THE annual Show was held on the 7th and 8th inst. in a large field at the upper end of Armley. The arrangements were most extensive, in fact the marquee erected for the poultry, &c., would have easily accommodated one thousand pens, but we are sorry to say the Show is as much in its babyhood as it was ten years ago. In poultry, Pigeons, and Rabbits were only 122 entries, when with a little more attention to the prize list, a regular revision, and a somewhat greater outlay, this section from being a drag upon the funds of the Society would be self-supporting. The pens were on Turner's principle, and were nicely arranged along one side of the tent, and the birds, &c., were well attended to.

There were two classes for *Game*, but nothing in them at all worthy of note if we except a Black Red cockerel shown by Mr. Beldon, and this was very good, the fact being that the winners in most cases were from that gentleman's yard, not, however, of such quality as we usually see from the same place. In *Bantams* the first were Black Rosecombs, and the second neat Black Red Game; and in *Brahmas* Mr. Schorfield showed a capital pair of Dark chickens. *Rouen Ducks* were very good, but the *Aylesburys* were not noteworthy.

PIGEONS were a pretty fair show as regards quality, but, as before stated, the entries were poor.

RABBITS had only two classes, but this was the best section in both entries and quality; we heard much grumbling as to the awards, which we do not hesitate to say were correctly made. In the class for Any breed two firsts were awarded, one to a grand Silver-Grey doe, and the other to a capital Angora doe, the second going to a Himalayan; and in Lops double prizes were given, one first to a grand Fawn doe, and the other to a Tortoiseshell; the seconds going to Fawn-and-white and Sooty Fawn bucks.

Classes were also provided for CAGE BIRDS, and a separate and very nice tent devoted to them, the entries being very good, although the prizes were far too small. The Yellow English, which we should interpret as a class for the common Yorkshire Canary, were but poor, the winners, especially the first-prize bird, partaking very much of the style of the Scotch fancy, these remarks applying also to the Buff class. In the Marked class were some pretty good birds, the winners being first Buff and second Yellow. Norwich were only few in numbers, but pretty good. Belgian (Marked) only one, but of Buff or Yellow five, but poor in quality. Of Lizards there were but two, but we could not understand the awards, but as we did not handle the birds, no doubt it could be explained; but on the face of it the second was by far the best, having an even cap, while the first was both flecked on the wings and broken-capped. In Mules there was a nice one of the Goldfinch cross in the first-prize cage, the second being a Linnet Mule. In the rest of the classes we did not notice anything of striking merit.

We published the awards last week.

FARNWORTH POULTRY SHOW.

THE Show of the Warrington Society came off on Thursday the 17th inst., when the weather was exceedingly fine, and the attendance good; the quantity and quality of the poultry being alike good. Eight silver cups, in addition to substantial money prizes, were offered for competition. Nearly all the classes being for young poultry.

Black-breasted Red Game produced some good birds; in fact, this class is again looking up. Brown Reds were very good, the birds in the cup pen models of their kind, but quite young; the winners in the next class were Duckwings and Piles. Mr. Brierley's pens were empty. In Dorkings Mr. Walker won easily. There were only three pens of Spanish, although a cup was given; but we could not understand the award, for while the pullets were equal, the first-prize cockerel was much coarser in face than the second. In Buff Cochins Mr. Crabtree won the cup with a grand young pen, beating Mr. Taylor, and taking the third also. Mr. Taylor was first and third; and Mr. Sidwick second in Partridge. Of Hamburgs there were some good birds, but the entries were poor; and there occurred a most striking mistake in judgment, or an oversight, the cup being awarded to a pen of Gold-spangled in which the pullet was willow-legged, and ought to have been disqualified. In Golden-pencilled Measrs. Duckworth took the leading position with a most charming pen, which might well have won the cup unless it had been given to the first in Silver-spangled, which were also grand birds. In Polands the winners were Silver. In Brahmas the winners were grand birds, and we believe all from the yard of Mr. Lingwood, who, as a breeder, seems to have had great success. The class for Game Bantams was for any colour, Mr. Entwistle winning the cup with a charming pen of Black Reds, closely pressed by a pen of Piles all the way from Scotland. The third prize also went to Black Red; and in the Variety class Blacks were first; Pekins second; and Silver Sebrights of the old style third; but it was generally thought that Mr. Leno's Sebrights might well have stood higher. In single cocks first was a smart Black Red; second the Sheffield cup cock, looking rather flat; and third a Pile; Crève-Cœur, Black Hamburgs, and Sultans dividing the Variety class prizes. There was a fine collection of Ducks, Geese, and Turkeys; many of the winners have been commented upon in our recent reports.

GAME.—Black-breasted Red.—Chickens.—1, T. P. Lyon, Liverpool. 2, H. Beldon, Bungley. 3, J. A. & H. Staveley, Driffield. Brown-breasted Red.—Chickens.—Cup, J. Fortune, Keighley. 2, G. C. Barnett, Birkenshead. 3, H. Beldon. Any other variety.—Chickens.—1, J. Fletcher, Stoneclough. 2, J. Fortune. 3, E. Bell, Burton-on-Trent. Single Cock.—1, J. Chesters, Nantwich. 2, F. P. Lyon.

DORKINGS.—Chickens.—1, J. Walker, Rochdale. 2, J. White, Warley. 3, L. Pilkington, Widnes. *etc.* W. Evans, Whiston. c, E. W. Southwood, Fakenham.

SPANISH.—Chickens.—1, H. Wilkinson, Earby. 2, H. Beldon. 3, R. Halsall and Sisters, Halewood.

COCHINS.—Cinnamon or Buff.—1, J. Walker. 2, W. A. Taylor, Manchester. Chickens.—Cup and 3, W. H. Crabtree, Levenshulme. 2, W. A. Taylor, *he*, C. Sidwick, Keighley. Partridge-feather, or any other variety.—Chickens.—1 and 3, W. A. Taylor. 2 and *he*, C. Sidwick. Other variety than Cinnamon or Buff.—1, W. H. Crabtree. 2, T. Aspden, Chnroh. 3, T. Stretch, Ormskirk. *etc.* W. A. Taylor. *he*, J. Walker; R. S. S. Woodgate, Penbury.

HAMBURG.—Golden-pencilled.—Chickens.—1, G. & J. Duckworth, Chnroh. 2, H. Beldon. 3, J. Long. Silver-pencilled.—Chickens.—1, H. Beldon. 2, F. W. Meznell, Derby. 3, J. Long. Gold-spangled.—Chickens.—Cup, T. May, Wolverhampton. 2, H. Beldon. 3, G. & J. Duckworth. Silver-spangled.—Chickens.—1, H. Beldon. 2 and 3, J. Fielding, Newbarn.

POLANDS.—1, W. A. Taylor. 2, H. Beldon. 3, J. Fearnley, Loughton. BRAHMA FOOTBALL.—1, T. F. Ansdell, St. Helen's. 2, W. H. Crabtree. 3, J. F. Smith, Sheffield. Chickens.—Cup and 2, T. F. Ansdell. 3 and *etc.* A. Rigg, Gateacre. c, J. Brookwell, Wigan.

BANTAMS.—Game.—Chickens.—Cup, W. F. Entwistle, Westfield. 2, R. Browlie, Townsend. 3 and *etc.* W. F. Addie, Preston. Any variety except Game.—1, H. Beldon. 2, J. Walker. 3, J. W. Morris, Rochdale. *he*, M. Leno, Dunstable.

GAME.—Cock.—1, W. F. Addie. 2, E. Walton, Hornccliffe. 3, F. Steel, Halfax. *he*, W. F. Entwistle.

ANY OTHER DISTINCT VARIETY.—1, E. Walton (Crève-Cœur). 2, H. Beldon (Black Hamburgs). 3, T. Marples, Blackburn (Sultans). *he*, C. Sidwick (Black Hamburgs).

SELLING CLASS.—Chickens.—1, T. F. Ansdell (Dark Brahmas). 2, J. Leeming, Preston (Black Spanish). 3, J. H. Pickles, Birkdale (Dark Brahmas). *he*, J. E. Parley, Newton (Silver-spangled Hamburgs); T. Wakefield, Golborne (Brahmas).

DUCKS.—Rouen.—Cup, 3 and c, W. Evans, Whiston. 2, J. Walker, Aylesbury. —1 and 3, R. Hutchinson, Littleborough. 2 and *etc.* J. Walker. Any other variety.—1 and 2, M. Leno. 3, H. J. Bailey, Teubury.

GESE.—1 and 2, J. Walker, Rochdale. 3, B. Bather, Tarbock. c, W. Burgess.

TURKEYS.—1, J. Walker. 2, J. Brookwell. 3, Rev. N. J. Ridley.

JUDGES.—Mr. R. Teebay, Fulwood, Preston; Mr. G. Fell, Warrington.

THE POULTRY-KEEPER.—No. 20.

COCHIN-CHINA OR SHANGHAI.

BUFF HEN—GENERAL CHARACTERISTICS.

THIS hen (*fig. 84*) is even more massive and compact than the cock, the head and the neck being less, and the comb and lower

Fig. 84.—Buff Cochin-China Hen.

fleshy parts almost absent. The foot is very short, the tail very small, and the body seems formed of large, prominent, and angular masses, markedly separated from each other. Seen from behind she seems more broad than high, and not having the ordinary look of a fowl. On a large nest she spreads out in a perfect half globe owing to the abundance of her feathers. The plumage is entirely buff. The flesh is finer and of better flavour than that of the cock, and these qualities are retained in the adult state, but not so in the cock.

Weight.—6 lbs. 10 ozs. at full age. When more than a year old some hens have reached 7½ to over 8½ lbs. This unusual weight is generally occasioned by natural fattening, and the hen is then excellent for culinary purposes.

Stature.—Height from the head to under the feet, 17½ inches to 19½ inches; from the back to under the feet, 9 to 11 inches. Size of shoulders, 7½ inches. From the development of the feathers which forms the whole of the thighs and hind quarters, 9½ inches.

Body.—Cubic viewed horizontally; neck small; shoulders and breast projecting; thighs very large; breast comparatively more fleshy than the cock's; bones less heavy.

Head.—Small and well formed.

Comb.—Single, straight, and very short, 1½ inch at most.

Wattles.—Very short and rounded.

Ears.—Very small.

Face.—Bare.

Tufts.—Like those of the cock.

Beak.—Clear yellow.

Eye.—Mild and intelligent. Pupil, clear grey; iris, black.

Leg-shank.—Short and very strong, as are the toes, and feathered as those of the cock.

at a show held under a tent. About 5 P.M. there was a terrific shower, the water poured off the tents in perfect sheets. Into the tents crowded the people, presently small rivers appeared among the baskets. The water flowed off the tents under the canvas, drenching the baskets through and through. And the results—why, a hen for which we know the owner refused £20, was put at the close of the show into the basket. It had to go to the other side of England, and by the time it reached its home the straw of the basket was still soaked, and the bird had the cramp so badly that it never recovered. Mind, we only say this *en passant*, in no way connecting it with this well-managed meeting, where the weather was most beautiful, but simply to show how very important it is for baskets as well as birds to be properly housed.

But now for the birds. The *Dorkings* were very good; the colour of the first cockerel very grand, and the second the best Silver-Grey we have seen for some time; in the pullets, first a beauty. We think she was at Bath. Both the highly commended ones were also good. In the Variety class, the first, White, was a young bird of great promise; second not so good. Pullets were quite up to the average. Somehow this Society always has a good display of *Dorkings*. *Spanish* were very young, but the birds looked up to doing well in future. *Game* made up the largest classes. The winners were good. The Variety Game class seemed to have been puzzling to many. We think it must have been the way the schedule was printed; consequently there were several pens of *Crèves* entered in this class which should have gone into the Variety class, which was after all empty. Schedules cannot be printed too clearly. *Cochins* were few and good. Both Mr. Yardley's birds were nice-grown birds. In the Variety Cochin class a very splendid White won. His frame was huge, and his shape good. The second was very young. In pullets the first was a good colour, well feathered; the second also good, and will make a large bird. In *Brahmas*, Dark, Mr. Leno's first cockerel was nice, also his pullet. The Lights we thought better than the Darks. The pullet was capital. *Hamburghs* were not first-rate, the Spangled best. The first pullet was of a good colour. In *Bantams* a beautiful Laced cockerel won first, and a well-shown Black Red second, and a good Brown highly commended. In pullets the first was smart, second Laced.

Only one pen of *Turkeys* appeared, and one of *Geese*. All the latter must have been fattening for the coming season. *Ducks* were only passable, save the winning pens. The first Aylesbury came from the town whence they got their name. Large sale classes followed, *Spanish* winning first in each, which would do for many a good show's open class, and then came the medley. This time *Spanish* and *Dorkings* won the prizes, which turned it into an "Any age and variety" class.

PIGEONS had only one class, but every pen was noticed. They were certainly unusually good, and made a pretty finish to this very nice Show. We congratulate the Society on their 1874 meeting most heartily.

DORKINGS.—*Silver-Grey or Coloured.*—Cockerel.—1, T. C. Burnell, Michel-dever, Hauts. 2, O. E. Cresswell, Early Wood, Bagshot. 3, J. Longland, Grendon. Pullet.—1, T. C. Burnell. 2, J. Longland. 3, O. E. Cresswell; J. Longland.

DORKINGS.—*Any variety.*—Cockerel.—1, O. E. Cresswell. 2, R. E. Oliver, Tonchester. 3, Rev. E. Barrum, Berkhamstead. Pullet.—1, Rev. E. Barrum. 2, and C. J. Longland.

SPANISH.—Cockerel.—1 and 2, J. T. Parker, Northampton. 3, W. R. Bull, Newport Pagnell. Pullet.—1 and 2, J. T. Parker. 3, T. Love, Kingshorpe, Northampton.

GAME.—*Black or Brown Red.*—Cockerel.—1, J. Garney, Winslow. 2, J. M. Payne, Rotherthorpe. 3, Withheld. Pullet.—1, B. Cox, Monilton, Northampton. 2, M. Ivens, Eyleson, Banbury. 3, Howard & Pattenhall, Wellingborough; T. Hancock, Northampton.

GAME.—*Any other variety.*—Cockerel.—1, B. Cox. 2, No competition. **COCHINS.**—*Cinnamon, Buff, or Partridge.*—1, H. Yardley, Birmingham. 2, Mrs. M. A. Mason, Boston. Pullet.—1, H. Yardley. 2, G. Tatham, Kingshorpe, 3, H. V. Story, Nottingham.

COCHINS.—*Any other variety.*—Cockerel.—1, R. S. S. Woodgate, Pembury, Tunbridge Wells. 2, W. R. Bull. Pullet.—1, R. S. S. Woodgate. 2, A. F. Faulkner, Thrapstone. 3, W. R. Bull.

BRAMA POOTRA.—*Dark.*—Cockerel.—1, M. Leno, Markyate Street. 2, C. Wright, Northampton. Pullet.—1, M. Leno. 2, J. S. Clarke, Oundle. 3, Rev. R. L. Story, Lockington Vicarage.

BRAMA POOTRA.—*Light.*—Cockerel.—1, P. Haines, Palgrave. 2, M. Leno. 3, Mrs. Peat, Sharabrook. Pullet.—1, Mrs. Peat. 2, P. Haines. 3, M. Leno; A. F. Faulkner.

HAMB ROUS.—*Gold and Silverspangled.*—Cockerel.—1, J. Ward, Barton Hill, Ashby-de-la-Zouch. 2, J. Garney. 3, T. Love. Pullet.—1 and 2, T. Love. 3, Ward.

HAMBROUS.—*Gold and Silverspangled.*—Cockerel.—1, A. F. Faulkner. 2, No competition. Pullet.—1 and 2, A. F. Faulkner.

BANTAMS.—*Cockerel.*—1, M. Leno. 2, Capt. T. Wetherall, Loddington, Kettering. 3, B. Cox; Capt. T. Wetherall. Pullet.—1, Capt. T. Wetherall. 2, M. Leno.

GOSLINGS.—1, T. H. Wykes, Greenfield, Strixton. 2, No competition. **DUCKS.**—*Aylesbury.*—1, T. Sear, Aylesbury. 2, S. Deacon, Oundle. 3, Hon. and Rev. C. J. Vernon, Griffon Underwood Rectory. *Rouen.*—1, R. Wood, Clapton, Thrapstone. 2, W. H. Harrison, Oxendon, Market Harborough.

TURKEYS.—*Young.*—1, S. Pinfrey, Wilby, Wellingborough. 2, No competition. **SELLING CLASS.**—*Cock, Drake, or Gander.*—1, J. T. Parker (Spanish). 2, M. Leno (Bantams). 3, J. S. Clarke (Brahma). 3, H. Yardley. 4, T. Sear (Aylesbury). 5, R. Sykes, Geddington, Kettering (Rouen); Hon. and Rev. C. J. Vernon (Rouen). 6, T. Hancock, Northampton (Guinea). 7, C. Wright (Brahma). 8, T. G. West, Dillington, Northampton. 9, T. Love; M. Leno (Bantams); Mrs. Peat (Brahma); T. Pell, Wiston, Northampton (Grey Goose); R. Sykes (Rouen); J. T. Parker (Spanish).

MISCELLANEOUS CLASS.—*Any variety of Fowls, including Guinea Fowls, Pea*

Fowls, Turkeys, Geese, and Ducks.—1, W. Nottage (Spanish). 2 and 3, J. Longland (Dorkings). 4, C. Wright (Brahmas). 5, B. Cox (Game); J. Holmes, Loddington, Kettering (Rouen); T. G. West (Muscovy); Capt. T. Wetherall (Black Red Game Bantams); Hon. and Rev. C. J. Vernon (Partridge Cochins and Rouen Ducks); A. F. Faulkner (White Cochins); W. Nottage (Spanish); — Roberts, Kingshorpe, Northampton (Dark Brahma Pouter); T. Love (Golden-spangled Hamburghs); S. Pinfrey (Turkeys); R. Sykes (Rouen ducks); C. Wright (Dark Brahma). 6, J. Hulme (Guinea Fowls); T. G. West (Muscovy Ducks); C. Foll, Stowe-Nine-Charches (Guinea Fowls); T. Love (Golden-spangled Hamburghs).

PIGEONS.—*Any distinct variety.*—*Cock or Hen.*—1 and 3, H. Yardley. 2, W. Nottage, Northampton (Pouter Cock). 4, T. Chambers, jun. 5, W. Nottage (White Pouter Cock and Carrier Cock); 6, T. Chambers, jun. 7, L. Watkin, Northampton (White Pouters); W. W. Watkin, Northampton (Pouter Cock); H. Yardley.

Mr. Edward Hewitt, of Sparkbrook, Birmingham, was the Judge.

WELCHPOOL POULTRY SHOW.

IN a district long reputed for the general excellence and most abundant supply of poultry of all kinds for table purposes, it was natural to expect to find a large competition of valuable poultry; nor were these expectations at all disappointed, for decidedly the best *Turkey* points and *Goslings* of this year that as yet have put in an appearance were shown at Welchpool. It was quite a feature of the Show that all the useful varieties were largely and well represented, but of such more strictly fancy varieties as *Hamburghs* the less we attempt to criticise the better. Some Light *Brahmas* quite took the lead in a class open to both breeds. The *Aylesbury Ducks* mustered strongly, but a class for *Game* cocks was composed of birds that appeared to visitors almost as though they had miraculously escaped from the hands of the cook at the last moment, so denuded were they by their natural moult of their feathers; but the *Game* chickens were in the highest plumage. Fine weather brought with it pecuniary success.

GAME.—1 and 2, P. A. Beck, Gillsfield, Welchpool. 2, P. Pugh, Welchpool. 3, 1 and 6, E. Pugh, Welchpool. 2, W. Powell, Battington Hall. 3, P. A. Beck.

DORKINGS.—1, J. Sayce, Welchpool. 2 and 3, Mrs. R. E. Jones, Cefn Bryntalech. 4, Mrs. Bayard, Gwernydd, Berriew.

SPANISH.—*Black.*—1 and 2, E. Williams, Caerhowell Farm.

HAMBURGHs.—*Gold or Silver-spangled or Pencilled.*—1, T. G. Jones, Llan-saintffraid. 2, T. Bridgewater, Montgomery.

BRAMA POOTRA.—1 and 2, Mrs. M. P. Ffoulkes, Llandysil Rectory. 3, G. Morgan, Newtown.

ANY OTHER VARIETY.—1, Mrs. Bayard, Gwernydd, Berriew. 2, T. Morgan, Bhaball, Kerry.

BLACK.—*Aylesbury.*—1, J. Richards, Llantyllin. 2, W. Brick, Pen-y-glodfa, Newtown. 3, J. Jones, Varchod. 4, E. Leavon, Clitterwood Mill, Rouen. 5, I. J. Jones. 6, W. F. Delmar, Henfais.

GEES.—1, E. Owen, Berriew. 2, K. Colley, Sylfaen. 3, W. Rogers, Welchpool. 4, E. Watkin, Forden.

TURKEYS.—1, Miss Humphreys, Berriew. 2, G. Robison, Trederwen, Llandrimo. 3, Mrs. R. E. Jones, Cefn Bryntalech. 4, R. Groves, Court Calmore.

Mr. Edward Hewitt, of Birmingham, was the Judge.

"BIG EYE" TUMBLERS.

ALTHOUGH these birds are called Tumblers, those bred at the present day seldom tumble; but I am told by the old fanciers that upwards of twenty-five years ago they were noted for their performances in the air, being what is called very close Tumblers; and it was not uncommon to find specimens that would tumble inside; but of late years, as they became more valuable, they were seldom flown; and being bred more for eye, beak, and colour, they soon lost the faculty of tumbling; and I doubt if, at the present day, many specimens could be found that would tumble. They are of four colourings—black, red, yellow, and dun—the colour being more brilliant than in other varieties of the same shade—the two latter colourings are very scarce. In build they have the appearance of a cross between a Barb and a Tumbler. They are very wide across the skull, and quite flat. They have a beak somewhat like a Tumbler, but much wider at the base, and of a fleshy appearance, and not so long as that of a flying Tumbler, and always white in good specimens confined to a room; but if flown the beak will soon change in colour to a darker shade. They have a regular Tumbler eye, surrounded by a white silky skin as large as the wattling of a first-class Barb; but no signs of wattling, and very few wrinkles. Any show of wattling or colour is a sure indication of a Barb cross. They are also devoid of feathers under the beak (which is covered by the same white silky skin as round the eye), and the letter the bird the more this peculiarity is developed, but without any appearance of gullet, as in Owls. They are inclined to be loosely feathered, and often look ragged, even when in good health. They are longer, in proportion to their size, than any other Pigeon—the difference in length being mostly in the tail and flight feathers. The middle feathers in the tail are usually longer than the others; and what is remarkable in this bird, if well bred, it will usually have fourteen feathers in the tail, while all others, except the Fantail, have twelve. This great length, in comparison to their size, gives them an entirely different appearance from other Pigeons, and becomes a leading characteristic of the breed. The secondary feathers of the wing are raised above the back when at rest, as in good specimens of

the Barb. Although to an inexperienced fancier they look so much like a Barb at first sight, they have nothing in common with them, except the fact of the secondary feathers being raised above the back, and it seems impossible that they could ever have been bred from them, as some might suppose, as no breed will show a cross with the Barb sooner than they will. This cross has often been resorted to by rival fanciers, but never with success, as this eye shows the wattling and colour at once, and in most cases the two extra feathers in the tail will be lost in the first cross. I well remember, at the exhibition of the Pennsylvania Poultry Society of 1868, a strong contest between two rival fanciers of this breed; one of them had undoubtedly used the Barb cross to defeat his opponent, but without success, as in the eye and beak the signs were unmistakable, and when the feathers of the tail were counted, there were only the twelve feathers of the Barb. I have never seen this Pigeon alluded to in any work before published, neither do I know anything of its origin. None of the old fanciers can tell me where the original stock came from.

I am informed by Mr. W. Wister, our oldest fancier, that fifty years ago (methinks that some of my younger readers will think that fifty years is a long time to be a fancier), but I will assure them that Mr. Wister was quite a fancier fifty years ago, and bids fair to continue one for fifteen to twenty years to come. I think our friend Dr. Morgan will sustain me in saying that thorough fanciers seldom die young. Had I the space I would like to tell my younger readers how much Mr. Wister has done for the fancy in this country during the past sixty years. I believe he was one of the first importers of all the varieties of Game Bantams, also of Game, and many kinds of fancy Pigeons, as well as dogs. He has never changed from his boyish fancy, and to-day he would drop one of his most difficult financial problems to admire a good Short-faced Black Mottled or Almond Tumbler; and of all the stock he has imported and bred in that time I do not believe he ever sold a specimen from his yards, but many hearts have been made glad by his generous gifts—the writer of this article among the rest. But I am getting away from my subject. Mr. Wister informs me that he remembers the "Big Eye" well for the past fifty years. When he first saw them they were bred by an Englishman by the name of Eggleton in this city, and for years afterwards they were known by the name of Eggleton Blacks, this being the prevailing colour. At this time they were excellent tumblers, and often had six white flight feathers—a peculiarity they have since entirely lost—and which gave them a very pretty appearance when on the wing. Mr. Wister can throw no light on the actual origin of the bird, but it is more than probable that they came from England or the East *via* Germany, as many of the old German merchant settlers imported largely in days gone by. The remnants of many fine strains of different varieties of Toy Pigeons are yet to be occasionally met with among the dealers of this city. If any of our fanciers can give any further information about the "Big Eye" not contained in the above article we shall be pleased to give it to our readers.—J. M. WADE.—(*American Poultry Fancier*.)

[Both the description and the portrait of this bird lead one certainly to the conclusion, in spite of the protest to the contrary, that it is the result of a cross between the Barb and the Tumbler: indeed, I have seen exactly such birds produced by this cross. I have seen them in a bird shop and in a loft, and I cannot regard them as other than a Barb spoiled or a Tumbler spoiled. It is perfectly possible that they may, or may have, tumbled, as the worst-shaped Tumblers have this property rather than the best. Whatever our cousins across the Atlantic may do, I always strongly advise fanciers in England to breed to perfection, if possible, the grand old varieties. Occasionally, as in the Satinette, a new variety comes up which is of beauty and value; but looking back upon our shows for a dozen years or so, how many new Toys, German usually, have appeared a few years and then disappeared!—WILTSHIRE RECTOR.]

THE QUEEN BEE.

IN CROSSING over one of our heather-clad moors in Yorkshire on the 8th inst., hearing a great buzzing sound, my attention was rivetted upon a drone bee with a queen bee. The drone so completely covered her majesty that I was unable to see her very distinctly. When I first saw them they were 3 feet from the ground, in equilibrium, slightly varying, and then they came very gradually to the ground, where they remained but a second; then they moved heavily away a short distance, the noise of their wings never ceasing even whilst on the ground. Following them, I again saw them gradually alight as before; and on coming near for further inspection, through the stupidity of my dog—for I was at the time hampered with both pony and dog—I lost sight of them altogether. It was about half-past twelve o'clock when this occurred, the day being warm and sunny.—W. C.

CANKER IN PIGEONS.—Rub the affected part with sweet oil, and then apply as much calomel as will lay on the extreme

point of a penknife to the part. Renew the application twice a day until the lumps may be removed by the hand. If the bird is attacked in the throat it may be applied with a feather dipped in oil. A pennyworth of calomel will suffice to cure a dozen birds. Or mix one drachm of carbolic acid and half an ounce of glycerine together, apply with a feather once or twice daily. I was recommended to try this myself for either Pigeons or poultry, and I found it soon effected a cure.—F. S. H., *St. Austell*.

BRITISH BEE-KEEPERS' ASSOCIATION.

WE cannot conclude our review of the Show without a few remarks on the honey, to which no less than nineteen classes were devoted—too many in our opinion, as we can see small merit in obtaining supers of honey under 14 lbs. weight, to which the Committee devoted four classes, embracing twelve prizes. The prize schedule for honey seemed to be in three divisions—*i.e.*, straw, wood or straw and glass, and glass only, each division being again subdivided into classes—as above 20 lbs., above 14 lbs. and not exceeding 20 lbs., and above 10 lbs. and not exceeding 14 lbs. The Committee in their next show schedule would do well to consider if weight combined with quality should not alone govern the award of prizes in each division, giving such a number of prizes as the funds permit.

The display of honey was certainly grand. Foremost was a magnificent display from Ayrshire, in the well-known Stewarton boxes; both honey and comb were nearly colourless, doubtless obtained from white clover. Much to be commended was the admirable manner in which the canny Scots had brought it to the Show, a distance of four hundred miles. We look upon the shallowness of the boxes as its salvation. Between each comb its senders had placed a folded sheet of newspaper, and the fold tightly packed again with paper, more of the same material covering all up. Mr. J. Anderson had, we were told, so brought more than thirty boxes without an accident. Certainly they taught the southerner a lesson here, for many of the finest English supers arrived too damaged to unpack. Conspicuous on the table were some beautiful Woodbury supers from Mr. Cowan, of Horsham, from 38 lbs. to 78 lbs. weight. The exhibitor in his loving care had covered them with a glazed frame screwed down, which was particularly unfortunate, as the Judges disqualified them on the ground that they could not taste the honey to insure that it was genuine, and not merely syrup stored by the bees. This dictum we look upon as a grave mistake, more especially as no such rule was in the prize schedule. Mr. Cowan's harvest from his bees this year was, we should think, the largest on record; it amounted to 707 lbs. of super, and 200 lbs. of extracted honey from twelve stocks of bees.

The three classes for straw supers only obtained six entries, for which nine prizes were offered! Two only exceeded 20 lbs. Straw must certainly surrender its ancient honours to wood and glass. Wood, and wood in combination with glass or straw, mustered sixty-two entries, twenty-eight of which were over 20 lbs., the heaviest 76 lbs. Very curious it was to note the diversity of taste in the way of shape and material for honey-receptacles. One reverend gentleman had even persuaded his bees to work in an old cheese-box, which was supplemented over a central aperture by a bell-glass.

The pride of the glass supers, numbering thirty-five, was a beautiful bell exhibited by Mr. G. Fox, containing 50 lbs. nett of comb and honey; nearly every cell seemed filled and sealed. It held its own against all comers, taking first prize; second, Mr. T. W. Cowan; third, Mr. S. Thorne. Twelve exhibits in this class exceeded 20 lbs. Placed on the table "not for competition," appeared the prize glass of Manchester Show, 1873, containing 87 lbs., but which its owner acknowledged had been obtained by feeding his bees with unlimited syrup. This glass attracted some considerable attention, as it had caused not a little discussion in the bee-keeping world. The class for table display of honey in comb was pretty well monopolised by the North Britons, who took first and second prizes; the third being withheld.

The entries for run honey in glasses were not numerous, and the variety of hues it showed seemed incomprehensible to the general public, who could not understand why some should be the colour of pale sherry, and others nearly as dark as treacle. The smaller glasses, however, of all shades were eagerly bought on the third day of the show. Cottagers' classes monopolised fourteen prizes, but only twenty-two entries were made. The Committee, however, anxious to give encouragement here, directed all the prizes to be awarded, although the Judges had at first withheld half.

We could have wished to see the "sold" ticket affixed more freely, but can well understand that a person who can afford to give £3 or £4 for a box of honey may rightly object to the trouble of taking it home, or standing the risk of breakage by railway porters.

On the 10th inst. the British Bee-keepers' Association held a meeting at the Crystal Palace to elect officers for the ensuing

year. The chair was taken by the Hon. and Rev. H. Bligh. The Chairman congratulated the meeting upon the successful progress of the undertaking thus far, and hoped that it would not be the last, as it was the first, year of such prosperity. He attributed their success to the strenuous exertions of the organisers of the Exhibition, and to the publicity given to it by those to whom we looked for information in this country. Sir John Lubbock had consented to act as President, and the Hon. Secretary, Mr. John Hunter, mentioned that the President had promised to subscribe what sum might be wanting for the expenses of the Exhibition. Mr. C. N. Abbott was elected Treasurer, and a list of Vice-Presidents was adopted, which included the names of Mr. Bligh, the Chairman, Lord Clifton, the Hon. and Rev. A. Legge, the Hon. R. C. Trollope, Sir Robert Biscoe, Messrs. Melladew, Symington, Hooker, Raynor, Carr, Cheshire, Filleul, Pennell, and other well-known bee-masters. The following resolutions were passed:—

1. That the name of the Association be the **BRITISH BEE-KEEPERS' ASSOCIATION**.

2. That its objects shall be for the encouragement, improvement, and advancement of bee-culture in the United Kingdom, particularly as a means of bettering the condition of cottagers and the agricultural labouring classes, as well as the advocacy of humanity to the industrious labourer—the honey bee.

3. That its officers shall consist of a President, Vice-Presidents, General Committee, from whom shall be selected an Acting Committee not exceeding seven, Secretary, and Treasurer; the whole of whom shall hold office for one year, and be eligible for re-election.

4. That the management of the Association shall be vested in the Acting Committee, of which the Secretary and Treasurer shall be *ex-officio* members.

5. The annual subscription of members shall be 5s., due and payable on the first day of May.

6. The Committee shall cause to be held an annual apianian exhibition, at a time and place they may deem most suitable to the interest of the Association and its objects, and adopt all such things as they believe will most conduce to extend and improve a knowledge of bee-keeping so far as the funds of the Association will permit, provided always that they shall in no case contravene a rule made in General Meeting.

7. That an ordinary General Meeting shall be holden once in each year, when the officers for the ensuing year shall be elected, and questions of government of the Association be discussed and resolved upon. An extraordinary General Meeting may be called by the Acting Committee at any time, and shall be called by the Secretary within fourteen days upon receipt of a requisition signed by any ten members of the General Committee, stating the nature of the business for which the General Meeting is to be called.

8. That as soon and so far as the funds of the Association will permit the Committee will endeavour to carry out the objects of the Association by means of lectures, meetings, the circulation of suitable books, certifying and sending out experts as qualified teachers and examiners of apiaries; exhibition and circulation of hives, of apianian apparatus, &c.; to spread a knowledge of all improvements and best possible methods of bee-keeping, and of the most profitable use and disposal of bee produce; also to establish a model apiary and an apianian museum and honey market, assist in the formation of provincial clubs affiliated with the Association, and generally to do all in their power for the advancement of apianian science.

BEE-KEEPING IN HAMPSHIRE.

ABOUT eight years ago I thought I should like to be able to tell the cottagers here how to manage their bees, without every autumn that wholesale and awful destruction of these wonderful little workers—in this neighborhood not by thousands merely, but by bushels and bushels. Accordingly I made myself acquainted with all I could possibly on the subject from all sources at my disposal. I concluded my plan should be wooden boxes 14 inches by 14 by 10, 1½-inch pine, with holes at top for feeding and supering. Driving was not in my thoughts, but the power of preventing swarming at will, and large bell-glasses full of pure honey every season were. I need not tell you I did not get either, although I soon worked-up a fine lot of healthy stocks from two good stocks purchased from cottagers. "How is swarming to be prevented?" was the common question. "Give the bees a room." "What's the use of that when bees will swarm from the roofs of houses and large hollow trees? And see what combs they make in such places. Why, I once took enough out of a roof to fill the old ooman's biggest washing pan besides what was wasted, as 'twas runnin down my elbows all the time; and jes come and see what I gets out of one of my bushel hives, for I've got um what'll hold more than a bushel o' tates." The last question and words were from a very successful old bees keeper near here now no more—one of those men who could examine his bees with bare arms, bare chest, and bare head, and they seemed to like his coming. Working in the fields all the

day, he would return in the evening and look round the garden hedges to hive what swarms were hanging there—mark this, and add to it the sulphur pit in autumn; and yet this man succeeded in obtaining large quantities of honey most years. How was it? Who can doubt that it was the swarming system and the hive that would hold "more than a bushel of tates" that did it?—the old-fashioned cottagers' system now put right and so ably advocated by Mr. Pettigrew. I say put right—that is, securing the 4-inch hole at top and the top flat, and the plan of driving and uniting, and add to that artificial swarming. This poor man managing his bees under such difficulties has taken more honey from one of his bushel hives put down with a swarm only four months before than I have in all the supers I ever put on my boxes.

About two years since I changed my plan. Having sold all my stock-boxes and all their belongings, I purchased four stocks once more from the cottagers in wretched hives, still the best I could get, and offered at our next cottagers' show 7s. 6d. and 2s. 6d. for the best and second-best straw hive, diameter 17 inches, depth 12 inches, flat top with hole 4 inches. This stimulated the men to make their first; now we can get good strong straw skeps made by them during the long winter evenings, and earning many a pound. The best hands will not be able to execute all orders during the coming winter, so great is the demand for this class of hive. From my four stocks I obtained four first and two second swarms, and last autumn I purchased at a sale twelve stocks at 3s. 6d. each, mostly in a starving state. These I fed with a half-hundredweight of sugar boiled with fifty-six pints of water, and saved them all, and gave them a little more in spring last, which set them to work in good earnest. By April, from different causes, out of my twenty-two stocks I lost six. The small black-headed tit worked some of them very hard last spring; one or two were robbed by bees and so killed. However, from my sixteen remaining I obtained twenty-six swarms, which I hived and united into seventeen hives. During the summer many a pair of old sparrows fed their young from my bee hives and kept their own coats very sleek, and sometimes I had occasion to be suspicious of starlings and swallows, both of which I have always encouraged about my house. A few weeks back, having received Mr. Pettigrew's good advice, being anxious to get rid of my small and dirty old hives I drove eighteen stocks, and united them to the bees in fourteen 18-inch hives. I got about 130 lbs. of very pure transparent run honey, carefully avoiding any pressure, as many of the combs were black and blocked up with pollen, and the hives were rotten. I threw the broken comb into water and left it to soak a few hours, washing all the remaining sweet out possible. I strained it and added a little sugar, and boiled up once; with this I fed my united bees from large bottles. Nothing could be more gratifying than to witness the hearty manner in which they all went to work to take it down—no disagreeing, but that happy roar. I must mention one exception, where I omitted using the minted syrup. The day after uniting this stock a terrible war raged, and I think most of the strangers were killed. It will be seen that since the spring I have united about forty swarms and stocks, which are now in fourteen 18-inch hives, for ten of which I have bought 100 lbs. of lump sugar, which I think will take them all through the winter in good style.

I have driven and united numbers of stocks for the cottagers during the last month; they now manage it for themselves and neighbours to their great delight. To one man it has been the means of saving at least twenty stocks, all of which were condemned to the pit three weeks ago. Another heard of two to be smothered; he quickly borrowed my dress, gave the owner the hives and contents, and secured the bees to himself.

And now, sir, if my story is not already too long, I have a question to ask you or some of your correspondents. How was it that at the Crystal Palace Show lately held the cottager, the class above all others in this country who sends the greater weight of bee produce into the market, was almost absent? for however barbarous their system may from all ages have been, it claims one merit—simplicity. Deprive it of the sulphur pit, the paltry small hive with the close top worked up to a point, and tending rapidly to a point at the bottom, and add the artificial swarming and feeding by the quart or gallon—in short, the very teaching Mr. Pettigrew is giving, and surely we have a system by far the least expensive—the system for the poor man, if not for the fanciful, but surely one that should be well brought out at the great show of the year if it is, as I think it should be, a national one.—W. I. C.

DRIVING BEES AT THE CRYSTAL PALACE.

I DESIRE to enter my earnest protest against a repetition of one feature in the recent bee show. I refer to the driving of bees in the gallery before a well-dressed crowd. As an exhibition of the humane method of keeping bees it was a monstrous folly. The bees being brought to a strange place, 50 feet above the level of the garden, and there driven, necessarily were not able to distinguish their own homes, they consequently fought

violently, and the ground was hestrewn with thousands of victims. I have made some swarms and turn-outs this year, and by following the directions laid down in Mr. Pettigrew's book I generally manage my work without killing half a dozen bees. If this can be done by an amateur of one year's experience, it may be worth the consideration of the professors of the art whether a repetition of their singularly painful performances should not be omitted next year.—BEATEN BUT NOT DISMAYED.

"PETTIGREW'S THEORY OF EVAPORATION REFUTED."

SOME days after the Crystal Palace Exhibition was closed I received a letter informing me that the words above, written in conspicuous characters, appeared on a table beside a bottle of honey at the Show. Not having a theory of evaporation, and not knowing anyone of my name that had one, I ventured to write to Mr. Hunter, the Secretary, to ascertain whether I had been rightly informed. Mr. Hunter has very kindly told me that the paper with these words "was published." He thinks the "exhibit was legitimate, but certainly should not be made in an offensive manner." He has given me the name of the gentleman who placed the paper on the table, but assures me "that the Committee as a body had nothing to do with the matter." I readily accept his explanation.

I have no theory to propound, and what I know on the question of crude and perfect honey was well known by many apiarians before I was born. I was taught it before I was eight years of age, by very experienced bee-keepers. For fifty years I have had ample opportunities of seeing, tasting, and handling both crude and perfect honey. The truth of the lesson taught me in early life has been confirmed a thousand times. Some three or four months ago I found in the works of Kirby and Spence, that they believed that honey undergoes a change in the bodies of bees. I will not enter into a controversy of any kind with the gentleman who placed the paper on the table at the Crystal Palace. I have no "theory of evaporation."

With a view to convince others that honey is perfected by bees, I extracted two bottles of crude honey from two hives about three months ago. It had been gathered into the hives but not reswallowed, or made into honey perfect. Four eminent medical doctors of Cheshire, and almost all the apiarians who have visited this place during the last three months, have tasted and examined it. They find and say that it is the pure nectar of flowers, but very different in taste from real honey. I took leave to send a bottle of it to the Editors of THE JOURNAL OF HORTICULTURE two months ago. I have still a small bottle of it left, which I should like to send to one or more of the Judges at the late Show, to taste and examine. No process of evaporation or artificial treatment will ever give it the flavour of honey proper.

I will now make a proposal, which I hope will be considered fair and honourable to all parties. I do it in the interests of truth and without ostentation. It is this—That I will undertake to extract crude honey next summer from the hives of any gentleman living within fifty miles of Manchester, in the presence of witnesses, and hand it to competent and trustworthy persons, and if they succeed by any artificial process in converting it into honey proper, I will give £5 to be offered as an extra prize at the next Crystal Palace apiarian fête, provided that those who differ in opinion from me on this question will give £5 each towards the same object in the event of failure. If a more fair and satisfactory proposal be made I shall be glad to accept it. If the proposal be accepted I hope that all parties will act in a manly spirit, and avoid the use of offensive personalities.—A. PETTIGREW.

A VALUABLE RECIPE.—The *Journal of Chemistry* publishes a recipe for the destruction of insects, which, if it be one-half as efficacious as it is stated to be, will prove invaluable. Hot alum water is a recent suggestion as an insecticide. It will destroy red and black ants, cockroaches, spiders, chintz bugs, and all the crawling pests which infest our houses. Take 2 lbs. of alum, and dissolve it in three or four quarts of boiling water; let it stand on the fire till the alum disappears; apply it with a brush while nearly boiling hot, to every joint and crevice in your closets, bedsteads, pantry-shelves, and the like. Brush the crevices in the floor of the skirting or mop boards, if you suspect that they harbour vermin. If, in whitewashing a ceiling, plenty of alum is added to the lime, it will also serve to keep insects at a distance. Cockroaches will flee the paint which has been washed in cool alum water.

PRESERVATION OF ESSENCE OF CITRON.—The addition of 2 ozs. of water to each pound of essence of citron assures its preservation, and the agreeable odour is retained for many years; the water, in falling to the bottom of the containing vessel, carries with it the mucilaginous matters which favour the resinification of the essence.—(*Pharmacist.*)

OUR LETTER BOX.

DEATH OF HEN (M. R. S.).—Her liver was severely ulcerated. No treatment could have saved her life.

COCHINS AT SPALYBRIDGE SHOW.—The second-prize chickens shown by Mr. Crabtree were bred by Captain Heaton. We correct the error in our report, because we know that the Captain covets the credit of being a successful breeder more than that of being a winning exhibitor.

WOLDSINGHAM POULTRY SHOW.—Mr. W. Younghasband informs us that the first prize for Game chickens was awarded to him.

DIARRHŒA IN YOUNG TURKEYS (J. R.).—The scouring of your Turkeys may be cured at once by giving some food made of barley, pea, and bran meal, mixed with a little pounded chalk and slaked with water. The swelling of the head is more serious. It is the commencement of a disease known only during the last few years. It attacks the head, eyes, throat, and mouth; the latter is generally extensively lacerated. The treatment usually is to feed on bread and ale, to give two pills of camphor, each as large as a horsebean, till there is improvement, and to rub the mouth with a strong solution of tar. The cause generally is that the weather has been cold and wet, or that the pouls have been allowed to wander about in the morning while the white frost is on the grass. At this time of year keep them shut-up till the sun is high enough to dry the grass. When there is neither frost nor dew let them out early.

HIVES (W. J. C.).—A series of notes on hives, their special objects, size, shape, and materials, will appear in our columns.

DAMSON WINE (E. L.).—We published a recipe in our Journal on the 3rd inst.

REMARKS.

16th.—Fair but dark early; fine by 9 A.M.; fair all day, but dull; sun bright at times.

17th.—Rather dull, though fair all day; gleams of sun occasionally; and fine night.

18th.—Hazy early, but soon cleared off, and was a pleasant day and night.

19th.—Fine morning and pleasant day, though not particularly bright or warm.

20th.—Fine morning; very bright at noon, cloudy after; and rain at 10 P.M.

21st.—Hazy at 8 A.M., fine at 9, and till the afternoon, when there was a sharp shower; a fine evening.

22nd.—A very fine forenoon, but showery in the after part of the day; wind rather strong.

Rather cloudy, and unsettled weather; the mean temperatures very slightly above that of last week.—G. J. SYMONS.

COVENT GARDEN MARKET.—SEPTEMBER 23.

TRADE still keeps quiet, and the late rains have brought in a better supply of vegetables. Prices generally lower.

From observations taken near London during forty-three years, the average day temperature of the week is 61.0°; and its night temperature 42.8°. The greatest heat was 89°, on the 5th, 1834; and the lowest cold 25°, on the 5th, 1855. The greatest fall of rain was 1.05 inch.

PANSIES AND OTHER VIOLAS AS GARDEN PLANTS.

BOTANICALLY speaking there is no distinction between Pansies and Violas, yet by custom and adaptability to a particular purpose there has arisen a popular and acceptable definition and designation of a different class of members of the same old family of plants. Violas, or what are popularly known as such, are characterised by a dense close habit, blooms below medium size, very abundant, and long-lasting. They will stand more heat and drought than the indigenous English type *V. tricolor*, the homely Pansy, probably traceable by an infusion of alpine blood communicated in hybridising with the once-famous and still useful *Viola cornuta*.

Violas are a very gay, easy, and hardy class of plants, at home anywhere. They have rapidly improved in colour and size of bloom without deteriorating in continuity. *Viola cornuta* Perfection, Magnificent, Sensation, and Queen Victoria are all examples of this. These are very rich in colour, free, and telling in spring and summer garden decoration, either in lines, beds, or mixture with other flowers. They are amongst the most useful plants that an amateur lacking glass convenience, and not able to make large purchases, can grow to make his home plot gay and interesting.

This form of Violas as a class will prove most effective in masses or unbroken lines of colour. Some of them, however, are by the intrinsic merits of individual blooms worthy of a place in the mixed garden, where, as a rule, nothing should have a place but what is good in itself, and will bear the test of scrutiny by the eye of a florist. One of the most useful and generally recommendable is the well-proved *Viola Perfection*, not that it is better than some of the others, nor, indeed, so good, but because it combines merit with cheapness it is worthy of the attention of the great mass of garden lovers who cannot appropriate a large outlay to the purchase of plants in quantity. The glossy mauve blue of this, with its close habit and profusion of bloom, will make a mark in any garden, and being plentiful, it can be had by the dozen, hundred, or thousand at a cheap rate. It is not an early spring bloomer, but is lasting.

To get a stock easily, the best plan is to purchase plants or cuttings now. They are plentiful, and in the best order for striking at this season. They can, moreover, be topped and struck again, and make fine blooming plants for next year. *Viola Magnificent* is of precisely the same nature as the above, but is richer in colour, and, being scarcer, is dearer; withal, I do not find it quite so free as its prototype. *Viola Sensation* is new, earlier than the preceding, and very fine. There is also *Viola Queen Victoria*, which carries a fine, shapely, high-coloured bloom. I have seen, but not grown, these, and will say no more than that they should be added to every stock, and this is the best time to do it, and far preferable to waiting, as is commonly

done, until the usual time of purchasing bedding plants in May.

Another promising and very distinct variety of *Viola* I find in *The Tory*. It was clothed with bloom in April, and so it has continued every day since. It is a fine bloom, of circular outline and good substance, of a deep blue colour. It emanated from Dicksons, of Edinburgh. I am considering whether I dare venture to post a cutting or two to Mr. Peach, but I am afraid the plant is not in his line. It is good. I have yet another fine telling blue, which most people walk up to and examine. It hails from the north. I have put in every sprig of a cutting from the solitary plant which is called *Alpha*, and I have hopes of extending to it the same measure of respect which I bestow on *Laxton's Pea* of the same advanced designation.

Here I leave the blue section of Violas, one and all of which are worthy of culture by all who can appreciate hardy plants, and who want a colour, with habit, which they cannot get in anything else to give the same effect.

Proceeding to the yellow bedders of this class of plants we find bright floriferous varieties, differing more in name than character. Most or all of them are crosses with the small *V. lutea* and some one or other of the large yellow Pansies, and combine the perpetuity of the one with the larger petal of the other. *Sandbeck Gem* and *Pride of Rufford* carry larger blooms than the *Cliveden*, and are very early, free, clear, and good. I can speak well also of another variety not yet common, which was the first to bloom, and has continued without any signs of failure through the tropical term of sunny weather of the passing summer—it is *Dicksons' Golden Gem*. It has been truly a mass of gold, the brightest and freest thing in the garden under either sun or rain. Its blooms are medium-sized, of no particular individual excellence, but for massing it is one of the most telling of the many effective varieties. Where *Calceolarias* refuse to prosper, and a bright yellow is wanted, *Golden Gem* may be tried with a fair amount of confidence.

What may be called the Pansy proper, *Viola tricolor*, may now have a meed of attention. It is not often it is deemed worthy of public mention. It is one of the flowers almost kicked-out of the garden by the tyranny of fashion. But fashion cannot annihilate, and this and other garden flowers have lived to be welcomed back to gardens. The greatest admirers of the Pansy are found amongst old people, and—has anyone ever noticed it?—young children. The aged recognise it as an old friend, loved in childhood and cherished still. The young, who know not what fashion is, receive the impress of its bold form and rich beauty, and in their innocence and still free minds admire. Turn a bevy of young children into a garden of flowers, and they will, as if by instinct, pick out the Pansies. Pansies and Primroses are names of plants first lisped and remembered. Other names may in after years be learnt and forgotten, but these old names are deeply engraved on the memory, and live to the end. The Pansy is a homely flower and a flower of home. It is quiet yet cheerful. If it savours of humility it is not

destitute of a certain pose of dignity, and reminds one somewhat of a pensioned-off housekeeper, who "rose from nurse, and was in the family for years;" and is not that a pleasing sight, speaking as it does of quiet and content? Pansies speak of this. See them where we may, they shadow from without the stability and easy comfort of the home within. They are not indicative of grandeur and gaiety, but rather of quiet home enjoyment which mayhap the grand and the gay not unfrequently long for. Let them, then, have a word of recognition, let them not remain in obscurity for ever. Their place is in the mixed garden, wherever that garden may be situated. It may have a place, as it ought to have, in the nobleman's demesne; it may be, as it often is, in the snug secluded parsonage; it should be, because the best suited, a part of the appendage of the British workman's home: but wherever the mixed garden is, there let Pansies be.

I am not going to enumerate varieties, or treat the Pansy now as a florists' flower, it is as a garden plant that I prefer to view it; yet I cannot help asking how many finer things have we, richer and of more real beauty than Pansy Imperial Blue, and what more bright than the glowing Cloth of Gold? How pure and clear is the early-blooming Blue King, and how intense and massive the later-flowering Celestial Blue! These are self useful to grow in quantity to make a garden gay rather than to be treated as florists' flowers after the manner of the particoloured varieties. Then there is the Magpie, quaint almost as its mottled patronymic; for it only puts on its white plumage in autumn and spring, casting it again in the hot season of summer. This is a variety for every old garden; and it is admired, too, by many more people than possess it, judging by the request for cuttings by those who see it when in full feather. Then what grand, gay, wonderful varieties there are now in the fancy class! They positively make people stop to look at them, and many to stoop and measure them. I have seen three and four-year-olds do this; and if the newer kinds of the Downies and Dicksons have made any reasonable advance in size and colour, they must be wonderful indeed.

This is a very good time of the year to increase Pansies. The autumn growth will bristle at the base with rootlets, and these sprigs have only to be planted in ordinary light soil to take root and grow; but they must be pricked-in deeply, leaving only an inch of green tip out of the ground. Finer individual blooms are produced from cuttings. These should be made of fresh crisp shoots that have not bloomed, and have solid—not hollow—stems; put under a hand-light in free soil, the surface covered with grit, and watered and shaded, they will soon become plants. The covering is best removed at night for the benefit of refreshing dews—the best of stimulants to make Pansies, Celery, and Groundsel grow. But for ordinary purposes in ordinary gardens the handiest way of increase is by root-division of the young autumn growth. The divisions should be planted in a nursery bed, and when nice plants, replant where required to bloom. Yet this final planting must not be deferred until late in the spring; that is a very common and very fatal error. Pansy planting with the rest of the bedding plants in April or May is, as the common saying goes, "the road to no town;" still this is often done, and then the plants are condemned for transient blooming. It is the very way, and the very best way, to create what is so severely condemned. Plant them early, in November if possible, but not later than January, or there can be no just judgment on their merits. Plant early, plant deeply, surround them with sharp grit to tickle the slugs and make them turn their tails, stay them with sticks or pegs to keep the wind from twisting their necks, and then when the cultivator has done his duty expect them to do theirs. They are easily raised from seed sown in light soil in a shady spot in March, for blooming the same season, and in August to stand over the winter, and bloom finely in spring. In this old land of ours, the land of old homes and associations, let not the old flowers be altogether forgotten, but give them a home and habitation, and never hustle them at the dictates of imperious fashion out of the gardens of their native land.—J. WRIGHT.

NOVELTIES IN THE ROYAL GARDENS, KEW.

MESEMBRYANTHEMUM TRUNCATELLUM is flowering in the Succulent house. It is one of the most curious of the genus both in form and colour, and is also extremely rare and little known. Though introduced in 1795, it was figured for the first time in any work in the "Botanical Magazine" for January

of this year. It is nearly allied to *M. obeonellum*, but is very much larger, and the leaves are of a livid brown colour; the flowers are yellow. It may be increased, though very slowly, by division.

Cedronella cana is flowering on the Rockwork. It is a pretty suffruticose Labiate, with dark carmine-coloured flowers, and is worth a place in every collection. Though an old plant it is not very commonly cultivated. It is considered hardy, but does not always survive the winter; a few young plants from cuttings should be kept in a greenhouse or frame for the winter. It flowers very freely, and the leaves are sweet-scented. *Polygonum Brunonis* is very pretty and suitable for rockwork. It produces a tuft of oblanceolate leaves; the flower stems are erect, about 1 foot high, and terminate in racemes of pink flowers. *Omphalodes Luciliae* is producing a few flowers, though out of season. It is very rare, both as a wild and cultivated plant. The leaves are smooth and glaucous, not at all according with the usual character of the Boraginaceae, to which it belongs. The flowers present the shades of colour between pinkish purple and azure blue. It is one of the very choicest plants for rockwork. Increase is effected by careful division. In winter it should be kept rather dry, as it is liable to damp-off. A native of Asia Minor. "It inhabits considerable altitudes, attaining 8000 feet." It was figured in the "Botanical Magazine" for July of last year.

Fourcroya Selloa is in flower in the Succulent house, and has never yet been figured. *F. bommelyni*, also referred to at page 72, proves identical with *F. gigantea*, figured in the "Botanical Magazine," 48, t. 2250. *F. bommelyni* itself is quite distinct, and in many collections *F. gigantea* may be doing duty for it; cultivators should therefore take note.

COTTAGE GARDEN SOCIETIES.

Any sane person must acknowledge that cottage garden societies are doing a vast amount of good. I do not propose to dwell at present upon the good resulting from them, but to point out a few errors and inconsistencies connected with them. I will, however, merely state *en passant* that in my opinion the best results come from judging the crops as they are growing in the gardens and allotments, rather than from the collections in the show-field. I could give many reasons for this if it is at all disputed. Nevertheless, have your great shows by all means; they give so much pleasure to visitors, exhibitors, and everybody concerned, excepting secretaries and judges. Now, I ask, Is it not possible to lessen the wear and tear of mind and body these gentlemen have to undergo on the occasion of a "grand exhibition and floral fête?" The duty of officiating at a show in London, Liverpool, or Manchester, is as play compared to that of being secretary or judge at a cottage garden society's show in a country village, for although there is more to do at the large shows, it is done more systematically, and everyone knows what he has to do.

I believe the great stumbling-block of cottage garden societies is making rules which they cannot enforce. The rules should be made less harsh, and when made should be enforced to the letter. Why should it be printed in the schedules, "no produce will be received after nine o'clock," and italicised "this rule will be strictly adhered to," when everybody knows he can take in his vegetables at half-past nine or even ten? And why should the judges be summoned to attend at nine, when they cannot possibly commence their duties before eleven? It is only those who have the charge of large establishments that know the value of an hour or two in the morning, and the mortification they experience of being hurried away from home and having left something undone, merely to stand about on the wet grass for an hour or two doing nothing, and perhaps without even an introduction to one's fellow judges. You must not look inside the tents, and you must not go out of sight, for you will be wanted directly. But if your lot is hard, what must be that of the poor secretary, with all his work to do, and everybody tugging at his elbow? However, the secretary's duties only come once a year; those of a judge often come two or three times a week.

In the course of time all is ready for the judges; it is perhaps eleven o'clock or half-past, and visitors are to be admitted at one. Now, if there is one thing more than another that takes time to judge it is cottagers' vegetables; there are such a large number of exhibits, and many of them are so much alike that at first sight it seems almost a hopeless task; if, however, your brother judge is a qualified one impossibilities soon vanish, and the prizes are awarded to your own satisfac-

tion, which is the chief point. The satisfaction of exhibitors must never be taken into account; all but the first-prize men are sure to be disappointed.

Difficulties often arise from the wording of the schedule. Species are written where varieties are meant; culinary and dessert fruits are lumped together, and classes are to be determined by the shape of the fruit. For instance, at a recent important show, it was thus: "Class 61, dish of Plums, oval. Class 62, dish of Plums, round." One judge wished to give the first prize to an extraordinary dish of Green Gages, the other preferred a fine-looking culinary Plum. There was no chance of the two agreeing, and there was no time to be lost; it was finally decided to award a special extra prize to the Green Gages, and all went on smoothly. But these hitches should not occur. Would it not be well if compilers of schedules would submit a copy to some competent authority for his approval?

Another thing which deserves attention is, prizes are offered for things which are of no value, and which require neither taste nor skill to exhibit; for instance, a device in flowers. What hideous things we see exhibited and gain prizes under this name. A hard-hearted judge will say, "This is not worth a prize; these shows are intended to be educational, to elevate people's tastes." The accompanying official replies, "It is only 5s., and the poor thing has had a lot of trouble." Judge No. 2 says ditto, and the prize is awarded; the result is, the following show sees a device a little larger, a little more crammed, and altogether a little uglier than its predecessor.

I could enlarge considerably on this subject, but I trust I have said enough to draw the attention of some of those concerned. And there is just another hint I should like to give in the gentlest possible manner. It is not a good plan to have always the same judges. They should not all be local men, and those who do come from a distance should have their travelling expenses paid voluntarily, as a matter of course, and not let it depend merely on whether or not they choose to hunt-up the secretary to bid him good-bye. Such matters should not be left to secretaries. Good gardeners are too much interested in the progress of their art to refuse to lend a helping hand when required; they often put themselves to much inconvenience to do so; they do not go to shows for pleasure, but because they feel it a duty to go when called upon; and they should not be expected to give their money as well as their time and talent.—W. TAYLOR.

STRAWBERRIES AND STRAWBERRY CULTURE.

In the midst of many counsellors surely there must be some wisdom, and it gives me pleasure to see that the opinions expressed in this Journal from the Editors* and Messrs. De Jonghe and Gloede, down to the more humble, practical, working gardener, will still rise triumphant above the statements of Mr. Douglas, and that the truth disinterestedly stated will yet prevail. One or the other must have been in error. While I am thankful to those who have taken the trouble to record their opinions, I have never courted an encomium in any single instance. What interest could M. De Jonghe have had in making the remarks he did concerning Early Prolific in the number for July 20th, 1871? I never saw M. De Jonghe, never corresponded with him directly or indirectly in my life; we are perfectly unknown to each other.

M. De Jonghe, in the article above alluded to, says, "Early Prolific, one of Dr. Roden's seedlings, is a masterpiece." I must here correct my impression that the words were "a masterpiece of skill." I spoke then only from memory, but the import is as stated, and is stronger really without the addenda. He goes on to describe what he is pleased to call its good properties. These are, "Early ripening. At the present time (June 10th), though it is a late season, out of twenty-eight plants in a bed some 40 feet long by 7 wide I count twenty-three large fruit ripe and ripening; whilst on May 25th, 1870, there were several fruit ripe. I have never met with any variety which sets its fruit so freely, or ripens it so quickly, as this. Its great productiveness may be judged from the fact that on two three-year-old stock plants there are respectively five and seven trusses of flowers, and 107 berries set in the

one case, and ninety-two in the other, neither flowers nor berries having been injured by the late spring frosts. Its hardiness is sufficiently proved by what is stated above." And he adds in a postscript, "I have delayed sending this article till the present time in order to assure myself of the accuracy of my observations. I think English growers who have the two Strawberries referred to (the other being James Veitch, raised by M. Gloede) will confirm, if they have not already proved, the truth of what I have advanced." Now after such a statement as this (as perfectly disinterested as it is possible to be) from, perhaps, the greatest authority on the Strawberry in any country, I do not think I have much to fear.

Mr. Douglas goes on to say, "Does 'W. R.' think that gardeners will believe him when he says that he saw ripe fruit of Duke of Edinburgh early in April, produced with little or no artificial heat? They must have been forced Strawberries in the usual sense of the word." Of course they must. Mr. Douglas must be very ignorant of his profession if he does not know that Strawberries will force by sun heat under glass, even if there is very little artificial heat. Possibly any little heat that was given was given at night, but of this I know nothing. I can quite believe the statement of the accomplished gardener who grew the Strawberries in question, and if he happens to see these remarks he may possibly echo that statement. When I called to thank him for such a fine specimen of his productions, he observed that even finer fruit had been sent into the house, and what is more, he added it forces with so little heat; in fact (I understood him to say), it was grown in quite a cool house. I merely mentioned the subject to show the great capability of one variety over another in this respect.

With reference to the annual renewal of Strawberry beds, I have no reason to alter the views already expressed. I have no doubt that a few fine berries are grown on first year's plants, and, indeed, at one time I adopted the plan to some considerable extent; but having of late years tried the opposite plan, I have quite satisfied myself that frequent renewals are unnecessary, and, of course, lead to a great amount of extra labour. Mr. Douglas says as one of his arguments, that several plants die every year, which does not improve the appearance of the beds. I beg to inform him that my plants do not die at all, but instead of that, continue to increase in strength and productiveness for several years, as already stated. If only a few plants die, my sense of order and regularity would be so much disturbed that I should order the entire bed to be destroyed. This shows me that either the soil or the cultivation at Mr. Douglas's place is not congenial to the Strawberry, and hence his want of success in the infrequent-renewal system. If I found, too, that the plants produced only small, ill-shaped berries, though they might be numerous, I should not recommend the plan; but I do recommend it as saving an enormous amount of trouble, and as being capable of producing a large quantity of fine handsome fruit, finer and handsomer, regard being had to the quantity, than can be obtained in any other way. If the season is fair for Strawberries in general, I say to all disputants, Come and see.

If Mr. Douglas ever ventures to submit his favourite Black Prince for competition as the best early Strawberry, I hope somebody fond of this kind of excitement will oppose him with Early Prolific and Duke of Edinburgh, and give him a good thrashing. That is all the harm I wish him.—WILLIAM RODEN, M.A., M.D., *Morningside, Kidderminster.*

ELECTION OF ROSES.—No. 2.

In giving the lists for publication I also endeavour to show in some degree the relative value of the Roses in the southern and the less favoured parts of the country. Perhaps I have made the division too southerly, but it was necessary in order to give some voters northwards. The line has been drawn in such a way as to leave Norwich and Leicester north of the line. By this means I have divided the voters into twenty-nine southern and nine northern.

I have not attempted again to distinguish the value of the vote as to the best twenty and second thirty, but have simply taken each Rose as named in the fifty. I have further mixed the two classes of voters together. It will be seen that the highest possible number of votes is twenty-nine in the south and nine in the north. In the following table the two divisions are arranged side by side, so that at a glance the different position of a Rose in the north and south can be seen. In each

* The writer, before bringing out these Strawberries, took an opportunity of showing them to Dr. Hogg and several members of the Fruit Committee who happened to be at Chiswick at the time; and in the Journal of the following week the Editors kindly append their opinion to my article describing them, saying they had seen and tasted the fruit of these Strawberries, and considered them a marked improvement on existing early kinds, or words to that effect.

list there are over fifty Roses—sufficient to show what are considered the best Roses in the two divisions.

SOUTH.—Highest possible, 29.

Fifty-four in all.

Those on the north side in italics are the Roses that appeared to do well in the colder regions, the proportion of their votes from the north being mainly the cause of their position in the general list. Comparatively speaking, Annie Laxton, Lyonnaise, and Boule de Neige have the greatest proportion of votes, as, although the southern voters are more than three to one, yet the northern votes are half their total. Madame Lacharme, it will be noticed, stands well as to its northern votes. Duc de Rohan does not hold the position that the list from Morpeth suggests. North gives only one vote out of the four it receives: this is the fair proportion—one in four. It will be noticed in the southern list that only four Roses obtain the highest possible number of votes, whilst in the north no less than eleven Roses obtain this enviable position, and amongst these is one Rose—Gloire de Dijon, which in the general list is not even in the first twenty; and Xavier Olibo stands nineteenth in the twenty, that Rose also obtaining the full number of votes from the north.

I have also thought it might interest some of our readers to see how many of those Roses, which by the general voting have obtained the twenty highest positions on the poll, are named by each of the thirty-eight voters in their twenty best. Mr. Burrell heads this list by naming in his selected twenty, seventeen Roses. Rev. A. Cheales, Messrs. Cragg, R. Smith, and Hinton respectively name sixteen each. Messrs. Quennell, Cranston, Davison, Turner, Mitchell, Walter, and Cooling, name fifteen each. Rev. C. P. Peach, and Messrs. J. Scott, H. Bennett, B. R. Cant, Curtis, and Fraser respectively note fourteen; Messrs. Robson, Mayo, Curtis, Ellis, Ewing, and Durbin, thirteen each; Revs. J. B. Camm and E. N. Poehin, and Messrs. Harrison, twelve; Rev. R. N. Milford, and Messrs. Tapner, Davis, and Prince, eleven; Revs. G. Arkwright, H. Dombrain, W. F. Radclyffe, and Mr. R. W. Beecher, ten; Messrs. Burley and May, nine each; and Mr. W. Wheeler, seven. I do not think from this list that locality has much effect on the issue.

Curiously enough, in last week's number Mr. Radclyffe rather answers my remarks on the four Roses that have lost position by a single vote. He omits Marie Baumann, and gives his reasons. I cannot put myself against his authority, still I cannot help urging all beginners to try Marie Baumann, and then discard it if they can. It is truly a magnificent Rose, and though a weak grower, and hanging down its head, yet few Roses can show such a lovely countenance. It is not weak everywhere. I have shoots from the bottom this year over 3 feet—not amiss for a weak grower; and certainly with me more than several—to wit, Baronne de Maynard and Felix Genero, Roses which Mr. Radclyffe has in his list. I am anxious to lessen slightly, if I can, the stigma thus placed on Marie Baumann, and therefore I urge it everywhere a fair trial. I feel convinced that of the thirty-eight voters, three-fourths would name it in the first ten.—JOSEPH HIXTON, Warminster.

P.S.—Since writing above, I have received a letter of thanks from a gentleman who regrets the omission of Madame Vidot. That Rose has, however, been named four times, twice by amateurs—viz., Messrs. Quennell and Curtis, and twice by nurserymen—viz., Messrs. Cranston and R. Smith. This is a further drop since 1872. I then made a few remarks on this Rose, which in former years I have seen grown by others most beautifully, especially by Mr. Durbin, of Englishcombe Rosery, near Bath. Greatly to my own disappointment, I can do little with it. Most of the white and blush Perpetuals have apparently a weakness of constitutional power which unfits them for the great wear and tear of Rose life, exquisitely beautiful as they are. I know no more beautiful Rose blooms, if well grown, than Madame Vidot, Mrs. Rivers, Madame Noman, Mlle. Bonnaire, Louise Magnan, and Marquise de Mortemart. All are beautiful, and all, alas! are tender. Madame Rothschild, as a blush, is an exception.

I have also received a note from Mr. Radclyffe, adding the raisers' names to some of the Roses. I gratefully acknowledge this help, and now add them. I think this suggestion of Mr. Peach's has been admirable.

Camille Bernardin (Gantrean), Maurice Bernardin (Granger), Général Jacqueminot (Rousset), Jules Margottin (Margottin), Madame Willermoz (Lacharme), Marquise de Gibot (De Sansal), Centifolia Rosea (Touvais), Marquise de Mortemart (Liaband), Mlle. M. Dombrain (Eug. Verdier), Souvenir d'un Ami (Belot Defougère).—J. H.

SUBJOINED are the lists of the amateurs' votes, those of the nurserymen will be given next week.

MR. J. ELLIS, *Harpley, Brandon, Norfolk*.—1, Alfred Colomb; 2, Maréchal Niel; 3, Charles Lefebvre; 4, Comtesse de Chabillant; 5, Duke of Edinburgh; 6, François Michelon; 7, La France; 8, Louis Van Houtte; 9, Madame Victor Verdier; 10, Madame Rothschild; 11, Madame Charles Wood; 12, Xavier Olibo; 13, Gloire de Dijon; 14, Reynolds Hole; 15, Pierre Notting; 16, Marie Baumann; 17, Lyonnaise; 18, Etienne Levet; 19, Maurice Bernardin; 20, Beauty of Waltham; 21, Dupuy-Jamain; 22, Annie Laxton; 23, Anna de Diesbach; 24, Baron Bonstetten; 25, Captain Christy; 26, Dr. Andry; 27, Exposition de Brie; 28, Ferdinand de Lesseps; 29, Fisher Holmes; 30, Gloire de Santenay; 31, Le Havre; 32, John Hopper; 33, Jules Margottin; 34, Lord Macaulay; 35, Madame Willermoz; 36, Madame Lacharme; 37, Madame Hippolyte Jamain; 38, Mlle. Eugénie Verdier; 48, Lord Macaulay; 49, Maurice Bernardin; 50, Olivier Delhomme.

REFERRING to Mr. Hinton's surprise at the preference for Climbing Devoniensis in the north over Maréchal Niel, I may say that I read his remarks while wearing in my coat a beautiful bud of the former, while I have quite failed to get a decent bloom of the Maréchal out of doors after several years' trial.

Climbing Devoniensis is most useful with us, blooming in autumn till the severe frosts come. I am, however, not intending to give up the Maréchal yet, and have within the last fortnight ordered a fresh lot budded on various stocks. In particular, a trial will be made of it on a north wall, for it is desperately "spring tender."

Allow me to express my obligations to Mr. Hinton for his annual list. I make it a rule to order any that appear therein well noted for, and not already in my collection.—E. P., *County of Durham*.

BATTERSEA PARK.—No. 2.

IN continuing my pleasant task I am desirous first of all to direct attention to a simple group that was remarkable for its inviting freshness, combined with an air of novelty and grace. It consisted of some large Fuchsias, Abutilon Thompsoni, a golden-leaved Fuchsia, and a broad green edging of Ivy. This beautiful bed was on a sloping bank, and, as in almost every other instance, the plants were skilfully arranged, so that the colours blended in pleasing harmony. Old or overgrown Fuchsias of all kinds may very usefully be turned to account in this way, and in a free rich soil they grow with surprising vigour, flowering profusely. They require no special preparation for this purpose, and invariably answer best when taken from the shed in which they are kept during winter, and planted at once in their summer quarters. When no shed is available for storing them in winter, they may be plunged in a thick bed of leaves, the tops covered with fern or straw, and be so left in the open air till spring with the great st safety.

Now let us turn to another of those charming circular beds which abound here, and which may justly be termed the gems of the garden. Clinging the gently-sloping margin we have an edging composed of two rows of Echeveria pumila, with a simple band of well-matched plants of Mrs. Pollock Geranium inside; the surface was carpeted with Lobelia speciosa dotted with Fuchsia Sunray, and there was a plant of Phoenix dactylifera

in the centre. The Fuchsias were about a foot apart, the branches upspringing and pendant with a few crimson flowers; the foliage yellow, pale green, and crimson, literally glowing like a sunray, mingling with the deep blue of the Lobelia; and the brightly green frondage of the Date Palm curving gracefully outwards from the centre over the bright colours beneath gave an indescribable charm and finish to the whole. The appearance of this bed was chaste, and yet very rich; it is a fine example of what is really desirable to replace the stereotyped combination of scarlet, yellow, and blue; and, what is more to the purpose, the lesson which it teaches is applicable to almost all gardens, for the few and simple materials of which it is composed are certainly within reach of all having a glass house or pit. Peter Grieve, a Golden Tricolor Geranium of a neat compact growth, and with beautiful leaf tints, might be used with advantage in this arrangement instead of Mrs. Pollock. Another circle had the Lobelia and Fuchsia precisely the same way, but it had no Palm or large central plant; the Lobelia was surrounded near the margin of the bed with a ring of the very choice Mesembryanthemum tigrinum, and an outer row of Sempervivum Pittoni.

Among the beds of bolder type the masses of Canna were most conspicuous, the taller kinds springing upwards far above one's head; fine as the effect of so many huge masses of this striking plant undoubtedly is, the situation and form of many of them strike one as being susceptible of considerable improvement. A long formal wall of Cannas elevated upon a plateau high up the side of a steep bank is neither a graceful nor attractive object, the formal outline and rigid block-like appearance being rather curious than beautiful. Many of these fine plants are, however, introduced very happily among some of the mixed groups, as was explained in the first paper; and this reminds me that there yet remains a group or two of bolder type to describe. Around one such was an edging of the huge grey-leaved Salvia argentea, with a row of white variegated Geranium inside it, enclosing a carpet of Geranium anemonifolium, out of which spring some immense plants of Wigandia mingled with what appeared to be some unusually tall plants of Solanum Pyracantha. The carpet of Geranium undoubtedly made this bed very attractive, the green Fern-like foliage imparting an air of sprightly grace and relief to the entire mass. A mixture of Ricinus, Wigandia, and a white-flowered Abutilon, with an edging of Funkia in flower was also good. Flourishing beds of Polymnia grandis, with its fine deep green much-cut pendant foliage, were of course very striking, as were many other beds of old and well-known favourites.

As usual the few examples of carpet bedding were very good, especially in the semicircular borders by the central river entrance. To these I hope to allude more fully in some future papers on modern flower gardens; but I must not omit to state here, that wherever I found a carpet bed composed of colours so bright as to somewhat infringe the bounds of good taste, a second glance invariably showed that foil beds composed of dark bronze-leaved Cannas, Ricinus, Polymnia, or Ficus elastica were there to complete the scene, which was evidently never intended to be dissected and carried away in separate portions, but that the entire group of beds, with the turf, the shrubs, aye, even the very walks themselves, should be regarded as composing a picture—one grand whole, every part or feature of which exercised an important influence upon the general effect. It is important to remember this, because many beds that appear very beautiful in a large public garden are not at all suitable for small places, and in the selection made here care has been taken to describe most fully such beds as are likely to prove generally useful.

The growing taste for succulent plants is commendable, their neat growth and the exquisite proportions of many rendering them very desirable as edgings and for marking the most intricate designs, as well as for rockwork, and I will now proceed to note a few of the most select kinds.

1, *Mesembryanthemum cordifolium variegatum* is placed first, not for its novelty, for it is now well known and appreciated, but because it is quite the best variegated succulent we have, and it also worthily takes high rank among bedding plants generally.

2, *Mesembryanthemum tigrinum*.—A rare, distinct, and very curious variety, with thick green leaves, closely dotted with white spots, and with a row of curved hook-like spines along the edges. It forms a pretty and very attractive edging.

3, *Mesembryanthemum deltoideum*.—A green-leaved kind, valuable for edgings from the quaint form of its abundant leaves.

4, *Sedum glaucum*.—This is a most interesting, useful, and

ornamental plant, yielding thousands of lovely, clustering rosettes of a bright glaucous hue, tinged with pink. Nothing can be finer than a carpet of it dotted with *Echeverias*, *Aloes*, or the pretty *Kleinia repens*.

5, *Echeveria secunda glauca*.—An indispensable plant, too well known to need description.

6, *Kleinia repens*.—The colour of this may be termed a bluish-grey. It has round tapering leaves, which by their peculiarly stiff and erect growth impart the singular and distinct appearance which renders it so valuable.

7, *Sempervivum montanum*, the Mountain Houseleek, is notable for the exquisite form of its compact rosettes. It forms a capital edging, as well as fine clumps for carpet beds.

8, *Sempervivum tabulaforme* is a singular plant, very suitable for an edging to beds of large plants. It grows to immense size; and the leaves lying perfectly flat upon each other, impart the table-like appearance which gave rise to its name.

There are so many other distinct succulent forms worthy of culture, that one hardly knows which to select. Those which I have described are, perhaps, the most useful. To those who desire a more extensive collection I may name *Echeveria glauca-metallica*, *E. pumila*, *E. atropurpurea*; *Aloe attenuata*, *A. mitraformis*, *A. cymbiformis*, *A. distans*, *A. frutescens*, and *A. pilifera*; *Sempervivum canariense*, *S. ciliare*, *S. repens*, *S. arachneoides*; *Cotyledon pulverulenta*, *C. alata*; and *Saxifraga nepalensis*.

Turning now to other plants we find a decided acquisition in *Leucophyton Brownii*. To the passing glance each plant of it appears to consist of a host of slender branches without leaves, but a closer inspection shows that its beautiful silvery-grey hue is imparted by the minute narrow leaves which thickly clothe the branches; it grows freely, but may be kept very dwarf by frequent pruning, which it bears with impunity. Of other grey-leaved plants, *Cineraria maritima compacta* is very good, as also is *Achillea umbellata*. *Santolina incana* is still unsurpassed as the best dwarf plant of its class. *Lobelia Omen*, of a pleasing lilac colour, with a dense spreading growth, is a very pretty, distinct, and effective kind that is calculated to become as popular as *speciosa*. A row of it looks well next *Leucophyton Brownii*. It is also good in Hyde Park. Of *Fuchsia Sunray* I have already said enough to show its value. It is a lovely variety, and appears to retain its foliage and colour perfectly well. *Coprosma Baueriana variegata* is another really splendid bedding plant.—EDWARD LUCKHURST.

GLAZING WITH PUTTY.

I CANNOT understand why such an outcry is raised against putty. I venture to say that nothing yet discovered answers the purpose so well if used in the right place, and here is the gist of the matter. Putty, as now made, is worse than useless in any position fully exposed to the sun and rain, for there, in the course of a year or two, it cracks and cakes off, and if renewed the same process takes place again and again, consequently the roof is never watertight.

As I said above, nothing answers so well as putty, but only for bedding in, and really this is all that is required of it. For some years I have adopted the following plan in glazing new houses, of which I have erected several. My roofs are all fixed, rafters or sash-bars 20 inches apart, and all the glass 12 by 20; this I find a most convenient size, and the advantage of having all one size enables you to keep some in store to repair breakages. The bars are placed so as to allow about an eighth of an inch, or scarcely so much, play; this is quite sufficient for any expansion of glass or wood. The glass is bedded in putty in the usual way, and as the work proceeds a small broad-headed tack is driven in at the lower corner of each pane, and this, if properly done, will both keep the pane tightly down and prevent it from slipping downwards. The putty on the outside is then smoothed off fair with the pane of glass, and the operation is complete. Thus done it has a neat and light appearance, and a couple of coats of paint (I use Carson's anti-corrosion) renders the roof perfectly watertight, and I venture to say that with a coat of paint every alternate year the roof will be as good after fifty years as when first glazed.

On a house I erected some ten years ago, and glazed in the old-fashioned way with sloping putty on the outside, I remove all loose putty each year, and it is now pretty nearly all off; but I do not put any more on, but simply paint over where the removal has taken place.

I am anxious to impress upon all putting up new glass the advantages of the above mode of glazing, on account of its simplicity; indiarubber strips, lead clamps, &c., I look upon

as cumbersome, expensive, and ineffectual. Not the least good quality of my mode of glazing is the ease with which repairs can be done, for by simply drawing the tacks and passing the knife down each side of the glass the broken pane will rise easily, and the new one be as easily put in and fastened down. It may be supposed that the tacks interfere with the free running-down of water, but this in reality does not occur in the least. —W. WINDEBANK, *Berwick Mount Nursery, Southampton*.

DEATH OF MR. ALDERMAN MASTERS.

It is with great regret that we have to announce the death of Mr. Alderman Masters of Canterbury, which took place on the 26th ult., at the ripe old age of seventy-eight. Mr. Masters was one of those rare instances of men in business who found time to cultivate intellectual pursuits, and who bring to bear the refinement which such pursuits produce on the everyday work of their calling. As a nurseryman long and well known he stood in the foremost rank, and the valuable collection of all kinds of trees, shrubs, tender and hardy plants which he formed in the Canterbury nursery, can only be judged of by a reference to the "*Hortus Cantuariensis*" which he published. The collection was in fact, when the writer of this first visited it more than thirty years ago, far superior to that of many of the botanical gardens of the Continent. Of late years, however, these rich collections have, in consequence of Mr. Masters' declining health, been allowed to go down; and as all his sons, with the exception of the accomplished editor of the *Gardeners' Chronicle*, long predeceased him, there was little inducement for him to continue them. Alderman Masters will be long remembered in the city of Canterbury as an active magistrate and a respected citizen; and as a patron of early genius, to the encouragement of which he lent his best efforts. There are many men eminent in art and in science who, when youths in the ancient city, can now testify to the stimulus they received in their upward course by the patronage of him whose loss they now lament.

SEEDLING BRIARS.

LAST autumn I obtained a few hundreds of seedling Briars, strong plants, for budding this season. They were planted in rich ground and grew freely, but I cannot say that they have proved a very satisfactory investment so far. Perhaps those who have grown them on a larger scale will be able to tell me whether it is usual for them to have such a very short crooked space between the roots and the collar of the plant as mine have. It is with the greatest difficulty that room has been found to insert a bud at all in the main stock; and when this is done, so crooked and knotty is the stem, that many of the buds have failed to unite on account of the uneven surface on which the plate of the bud rests. Altogether it seems to me to be a troublesome and fidgety stock to bud compared with the Manetti; and unless the future growth of the bud makes up in a marked manner for the extra trouble in budding, I shall most certainly stick to the Manetti for dwarf Roses, even if seedling Briars can be obtained at 1s. 6d. a hundred.—R. W. BEACHEY.

[The Editors have forwarded the above to me. Not having had sufficient experience, and the question being one of great interest to Rose-growers, I should be glad to elicit replies from others. "*D. De L.*" has spoken most favourably of Mr. Prince's seedling Briars, and I have no doubt that under proper conditions they will succeed. Perhaps the lasting powers of the blooms may have as much to do with the quality of the soil as the stock. A good staple of soil converted into a Rose garden from an ordinary arable wheat field would most likely prove a first-rate soil for exhibition.

From Mr. Beachey's description I should fancy the seedling Briars were not sufficiently pruned or planted deep enough. The question in my own mind is, whether the real value of the seedling Briar is not really the fact of its being a seedling, and not that of being a Briar. Some plants I got from Mr. Prince of new sorts of Roses on the seedling Briar, which were put in alongside Manettis, are much the same in growth, &c. There is, in short, little apparent difference, and I do not see that the system of budding on the seedling Briars will prevent the root-suckers which are so obnoxious in Briars. No doubt some persons will make the same objections to Manetti suckers, but they are easily preventible, and everyone or anyone at all conversant with Rose-culture can easily prevent suckers from Manettis; but no precautions can prevent

the glazed frames with hooks and eyes at the top instead of using hinges or making them fixtures. I made one yesterday, and it has simply two or three hooks on the top bar of the frame, and the eyes are on the glazed frame. This mode renders them easy to paint and remove for any purpose. They are easily unhooked, and the wholeinery is so rendered portable.—G. C., *Croydon*.

GERANIUMS AT CHILWELL.

HAVING on the 21st of August an opportunity, by a little study of Bradshaw, to have about an hour and a half at Mr. Pearson's Chilwell Nurseries, and being somewhat of "D., Deal's," turn of mind—inclined, like Dr. Watts's busy bee, to make the most of the shining hours, I accordingly paid a flying visit, and will endeavour briefly to allow your readers to partake of the honey I gathered from the flowers—not feeling like that selfish bee who gathered honey all the day, but ate it all the night.

HAVING wasted nearly two minutes over the station-master at Beeston, who refused to allow me to retain my ticket because I had booked through from Bristol to Nottingham instead of to Beeston, whereby the station-master was able to secure to the Midland Railway Company the great sum of 6d., which was my additional fare from Beeston to Nottingham, I found Mr. Pearson waiting for me outside the station, and a few minutes' drive brought us to Chilwell.

Previous to going to see the new seedlings of 1873 I went round the gardens to see some of the older favourites. The first bed we came to, passing over one or two Tricolors, was Corsair, here as elsewhere very good, and establishing its reputation as being one of the best zonals for bedding, not shedding its petals as Jean Sisley and one or two others of that class. Mrs. Mellows came next: this was not so good as I have seen it before, the season being too dry for it. Mrs. Holden, a dwarf deep pink, a type of a good bedder, stout footstalk, large truss, was next. Then came Edward Sutton: this and General Outram are much alike—a deep scarlet crimson. Next to this was Mrs. Turner, in colour somewhat between Amaranth and Florence Durand, and very promising. Augusta Miles was not at its best—too dry. The Rev. T. F. Fenn, a dark crimson, was near it and doing well; the dry season which had not suited Augusta Miles having just suited the latter, which last year grew much too strong for me. The next, George Miles, a cerise scarlet, large truss, tall in the footstalk, was new to me. One of Dr. Denny's seedlings, Wellington, was the next bed; fine in colour, but growing too strong here. My own namesake, a bronze raised by Mr. Laing, of the firm of Downie, Laird, & Laing, near to this, was one of the best bronze beds I ever saw—short-jointed habit, and a fine rich gold and red leaf. Robert Evans, a cerise or rosy scarlet, gave me the impression as being better for pots. Col. Holden was good, but too coarse and strong for most gardens; but this and Dr. Tate seem exactly suited for those who like a good hardy sort and free grower.

Mrs. Fyche, another dwarf deep pink somewhat like Mrs. Holden, a very good bedder, came next; then General Outram, and next Mrs. Hole, a dwarf magenta—one of the seedlings, I believe, from Violet Hill—a large truss, very floriferous, and quite a gem with those who will treat it properly, but too dwarf for harsh treatment. Near this was Grand Duke, still one of the best of its class, raised, I believe, by Mr. G. Smith; then Shakespeare, not so good as I have seen it before, and near, Lady Kirkland, one of Mr. Laing's seedlings, very good. If Lady Kirkland had but a stouter footstalk it would be very difficult to defeat. I had a bed this year fuller of large trusses of flower than almost any bed I ever saw; it hardly ever seeds, and the petals stand sun and wind well, but it wants a good footstalk. Next was Mrs. Hetley; then Florence Durand, not nearly so good as with me, but the bed was too dry and suffered from the proximity of a Conifer. Then came two old favourites—Bayard and Duke of Devonshire, and near, Mrs. Lowe and Frank Miles. And to show how Geraniums vary in different seasons under different conditions, Mrs. Lowe, which with me was one of the very best light flesh-pink beds I ever saw, was not nearly so good here—so much so as hardly to be like the same plant; but there had been so great a demand for them in the spring that Mr. Pearson was almost sold out, and only some of his worst plants had been put out. This also confirms me in my impression that if there is a trying season inferior plants, however good the kind, never recover to do justice to the sort. In another part of the grounds, in

front of the orchard houses, were some more beds of zonals; some of those I have named recurring again with one or two others, as Mrs. Taite, a good pink, and Mrs. Vincent, a very fine crimson, which were not planted out elsewhere.

We next went to a long double span house full of seedlings of 1873, to be sent out next year. The most noticeable features in these were, speaking of them in general, a great advance in the size of each individual bloom, with a rounder-shaped flower, more of the true florists' type; the generality of the flowers much larger than a crown piece, and the truss large. How much of the Nosegay blood is left in is difficult to say, or whether they will stand sun and wind when bedded—this will be a test of time; but, as far as the individual flowers in their pots in this house, there was no doubt that there was a great advance. I will mention those that struck me most. First Sir H. G. Stanhope, of the General Outram stamp, but larger flower and pip; Lady Byron, bright pink, a white eye, good for exhibition as a pot plant; Brutus, a light crimson scarlet; and Charles Smith, a darker; Ethel, a fine lilac; and Mrs. J. F. Fenn, somewhat in the way of Amaranth, but size of pips larger; Rev. — Atkinson, somewhat like Mr. Pearson's Rev. C. P. Peach, a deep scarlet, very little orange; John Gibbons, very large, crimson scarlet, likely to make a striking pot plant; Mrs. Huish, a magenta crimson, very good; and John Fellows, reddish crimson, very good; Mrs. Bosworth, light pink, light eye; Annie Orton, something like Amaranth, but much larger individual flower; Percy Cooper, scarlet, with a white eye, of the Jean Sisley stamp, a finer flower and brighter, would be first-rate for exhibition. Next I noticed Mrs. Whiteley, also a scarlet with a white eye; and two of the very best salmons I have yet seen—Miss Strahan and Ellen—a great advance among the salmons, fine both in truss and flower, sure to be good in pots, but yet to be tested for bedding. There was also a fine 1874 seedling, Miss E. Burnside, of the type of Maid of Kent, but a much finer and smoother flower, and large truss. Among the 1873 seedlings I also omitted Mrs. Brown, a cerise magenta, large truss, perhaps of the firm Brown, Jones, and Robinson. Two of Mr. Pearson's Tricolors not sent out will also be acquisitions as striking now a really new stamp of colour—a magenta tinge in the red zone; these two are Miss H. Walter and Miss Eleanor Miles. I have not time at present to add more.—C. P. P.

SEACON HEATH.

THE SEAT OF THE RIGHT HON. G. J. GOSCHEN, M.P.

TOURISTS and others visiting the fashionable watering place Tunbridge Wells cannot have omitted noticing the beautifully undulating character of the country near that great resort of wealth and fashion. The common, around which residences of every style of architectural design have arisen, is in itself not a bad example of what the neighbourhood abounds in. Sandstone rock more or less exposed to the surface, and Ferns and Gorse, give it a stamp of wildness. But my purpose is not to describe Tunbridge Wells, but merely to point out that the country is of the same character for several miles in various directions, more especially eastward. The eminences and declivities seldom prevent cultivation, but are sufficient to give that interesting character to the landscape so much admired by those who look to the softer and more manageable features of rural scenery, if it may be so called, with greater pleasure than they do on barren rock and inhospitable waste; for here we have the highest possible cultivation blended with a natural scenery that in itself is at all times a source of pleasure to look upon.

Decomposed sandstone is the basis of the surface soil. The vegetation is, as may be expected, a wide and varied one. The Oak, Birch, Scotch and Spruce Fir assert their sway as monarchs of the forest, or of such lands as still retain a semblance of not having submitted to either spade or plough. To these may be added the Hazel, Broom, Furze, and now and then Heath, with plenty of the common Brake. The northern sides of hedges and positions of a like kind glisten with the common hardy Ferns, not the least interesting being several varieties of the Scolopendrium, which here finds a home to its liking. The soil is generally of a pale yellow colour, and contains few stones, and these generally soft, but it is very fertile, and most crops attain great perfection, notably many kinds of fruits; and it is a singular feature of the district that Apples grown here produce a different kind of cider from that which is made from the same variety grown in the neighbourhood of Maidstone, the latter being an inferior liquor, although

the fruit appears to be finer, thus showing that certain soils supply food of a different kind to what others do. An absence of calcareous matter and a corresponding preponderance of iron cause much of the difference, and iron works existed in the neighbourhood and were worked to great advantage long before the present seats of the important iron trade in the northern counties were ever thought of. Lamberhurst, a village a few miles to the east of Tunbridge Wells, supplied the iron from which the railing that until very recently surrounded St. Paul's Cathedral was made; but the furnaces have long ceased to be worked, and the neighbourhood is as exempt from the smoke of iron foundries as it was in the days of Julius Caesar. But the loss of the iron trade is amply compensated by the improved cultivation of the land, and the greatly enhanced value of property resulting from the health-giving character of

the district having attracted many of the rich London merchants and others in search of a pleasant country home. Hence many small villages have acquired a certain degree of importance, and notable amongst such is that of Hawkhurst, which has made such rapid progress that not long ago I heard it mooted amongst some of its inhabitants whether it could not support a local paper.

Seacox Heath is about ten miles east of Tunbridge Wells, and two miles west of Hawkhurst. I am not exactly certain whether the mansion stands in the county of Kent or in Sussex, but believe it is in the latter county, although the grounds extend in both. The property would appear some time in the early part of the present century to have been in the possession of a gentleman who had a good appreciation of what was likely to improve the aspect of the grounds, for he

Fig. 87.—SEACOX HEATH.

planted most of the choice trees and shrubs that were to be had at the time, notably some good Evergreen Oaks and several Pines, as well as deciduous shrubs and trees, which, having now attained a large size, give importance to a place that by its architecture at once strikes the beholder as quite new. A large mansion, successively the residence of the Wardroper and Palliser families, stood near here. It is said to have been built by the "Goudhurst smugglers," a gang infesting the neighbourhood until they were extinguished by their leaders being executed in 1748. The wealth of some of the members of the gang, and their daring exploits, would be incredible were they not revealed by evidence preserved in our judicial records.

The present mansion and its terraces are the creation of the last seven years, the property having been purchased by its present owner shortly before that time; and the existing mansion and its appurtenances not being adequate to the requirements of the family, Mr. Goschen determined to build another. A suitable site having been found but a short way from the old one, a large and handsome structure of a pretty light-coloured freestone has been erected. Externally it presents suitable architectural and sculptural embellishments, the character of the stone aiding the latter considerably by the fineness of its grain, which is capable of being cut with great sharpness; while internally there are a noble hall and staircase,

with suites of rooms fitted with all the modern requisites which wealth and skill can command.

The situation is well chosen. The highway, a broad and well-kept one, leading from London to the once-important town of Rye, passes through the estate, and a suitable lodge is being erected at the entrance to the carriage road, the latter curving round and partly through a cutting, rendered necessary by the high ground in a south-westerly direction, for some distance, when the mansion is approached on the north side, a spacious area being set apart for the carriage front, which is fenced-in by a suitable balustraded wall, with ample space for a carriage road, gravelled with the small coloured pebbles found on certain parts of the seashore. The carriage road, I may observe, in its course to the house passes through a portion of the park as well as the grounds to which the term "dressed" may be applied, and groups of shrubs have been planted at suitable places along its line. The mansion, I believe, does not stand exactly with the cardinal points, but sufficiently so to justify my saying that the carriage entrance is on the north side, while on the opposite side an ample space is enclosed as a terraced flower garden, the natural fall of the ground in that direction rendering more than one terrace necessary. On the lower one, which is reached by wide flights of steps, a set of flower-beds, upwards of fifty in number, and occupying a sort of semicircular plot

of ground, with the most ample spaces of grass between, looked exceedingly well at the time of my visit, being planted with the best varieties of bedding plants, including some not generally met with. Notable amongst the latter was apparently a *Chrysanthemum*, which I was told was quite hardy and continuous-flowering; in height and habit it matched very well with *Geraniums*, the colour being a clear white, and in the distance it looked well. To the westward of the mansion the terrace was also continued, but in a different form, yet still with an ample enclosure next the mansion; while on the east side, which led to the main part of the dressed grounds, a large and showy conservatory had been erected. I use the terms "large" and "showy" in contradistinction to good and commodious, which I doubt much if it can be made to be without such alterations as the architect would be apt to say would mar his work. As it was, architectural embellishment left no room for plants, and climbers would seem to be ignored altogether. Perhaps, however, the necessity of preserving the harmony of design between a conservatory adjoining a mansion and the latter is so great that resort must be had to a professional artist. It would be well for all who contemplate erecting a costly structure for the well-being of plants to consult someone who understands that part of the decorative art better than the man of bricks and mortar, for great mistakes are often made in this matter. At the time of my visit, however, the conservatory had barely passed out of the builder's hands, but I remarked that at least four-fifths of its internal area was occupied by paths neatly paved with fancy tiles, and the walls, roof, and the fittings generally gave token that the builder would not like these features to be concealed by climbers or vegetation of any kind.

Emerging from the conservatory we find ourselves by degrees carried beyond the range of the geometric and formal stamp of things immediately surrounding the house, and winding walks bring us amongst Pines and various shrubs planted a long time ago, but very considerable alterations and additions have been made up to the present season. A mass of shrubs was shown me that had only been planted last autumn, and when we consider how very unfavourable the spring had been to all new-planted subjects, their appearance was highly creditable. Some good examples of Pines were to be met with, and a Yew hedge of considerable age and size was pointed out as having been planted only a year or two ago, yet it had the appearance of having been there all its life. The walk referred to led by the site of the old mansion, a part of which is to be left for some special purpose, and as it does not in any way intrude upon the present structure, it may very properly remain.

The kitchen garden is also in this direction. It is mostly new, and with, perhaps, somewhat too steep a slope to the south; but to obviate the evils of this by the sun striking too forcibly on the steeply sloping side, the rows of vegetables, including Celery, had been wisely planted east and west, so as to afford each other shade; and although my visit was in one of the hottest days in July, and at a time when most crops were languishing from want of water, everything was fresh and doing well. The surroundings contained many tokens that the presiding genius was well versed in botany, which, however, will hardly create surprise, seeing the garden is under the care of a Mr. Don, a name sufficient in itself to indicate that practical botany was sure to be attended to; but that a scientific knowledge of the character of plants is not inimical to good cultivation was here shown, for everything was in good order. A walk round revealed the fact that Mr. Don is a great admirer of all that is good in shrubs. I noticed several shrubs not usually met with in ordinary collections, and the same of herbaceous plants, of which there is a good collection. Mr. Don was specially anxious to cultivate such plants as produced flowers which when dried are ornamental in winter, and among the Everlastings there was a good batch of *Acroclonium roseum* growing in a sort of raised bed, luxuriant and fine, while, of course, the various kinds of *Helichrysum* were duly represented.

The term Heath as applied to this place has no more bearing on its present appearance than the term "park" or "fields" has to districts in London now closely packed with streets. The old name only has been retained; the place in every sense is new, and looks out on a park of rich pasture land, sufficiently diversified with trees of healthy growth. So far from its bordering on an extensive waste, it is questionable if there is any part of the United Kingdom where land is of more value than it is here; and I may add that it would be

difficult to find in any part of the country a place where the farming is better.—J. Rouson.

FLOWERS FOR OUR BORDERS.—No. 41.

ARNEBIA ECHIOIDES.—ECHIUM-LIKE ARNEBIA.

This plant has been bandied about from one genus to another by different botanical writers, until it has acquired a somewhat lengthened list of synonyms. By Linnaeus it was termed *Lycopsis echioides*, but in that genus the mouth of the flower is closed by scales, and the nuts are hollowed at their base; by Bieberstein it was classed with the *Alkanets*, but these, too, have the throat furnished with scales, as we have already seen; and by Fischer and Meyer it was placed among the *Lithospermums*, under the name of *L. erectum*. It is with

Fig 88.—*Arnebia echioides*.

this genus that it has the greatest affinity, and there seems, indeed, no good reason for removing it thence. The genus *Arnebia* is doubtless sufficiently distinct from *Lithospermum*, the two-lobed stigma of the latter being replaced in the former by one with four lobes of a subglobose form. But it is singular that this feature, which is almost the only point of difference between the two genera, is absent in the species under consideration, its stigma being bifid.

But under whatever genus the plant may eventually be classed, there can be no doubt of its ornamental value as a rock or even a border plant. It grows from a span to a foot high, the stems being mostly simple, clothed with oblong hairy foliage, and terminated by a head of handsome yellow flowers spotted in the throat with purple. It has proved of difficult cultivation, and has consequently become very rare; it is, in fact, doubtful if the plant now exists in more than one or two private gardens in this country. *Arnebia Griffithsii*, or "Flower of the Prophet," a pretty annual species, has proved equally intractable, all attempts to retain it in cultivation having failed.

Arnebia echioides is a native of the mountains of the Caucasus, and also of Armenia; and was first introduced to the Royal Gardens, Kew, by the late Dr. Fischer, of St. Petersburg. It is to be hoped that so good and desirable a plant may attract the attention of collectors, and be again introduced to our gardens.—(W. Thompson's *English Flower Garden*, Revised by the Author.)

DISPUTED DECISION AT A ROSE SHOW.

A short time since a stand of Roses took the first prize, the exhibitor of which, ignorant of Rose-showing, had placed

them on his beard deprived of all their foliage, till a brother exhibitor told him he thought they ought to have had their foliage with them as when cut from the tree. Thinking himself wrong, he, the exhibitor, before the judging came on, placed foliage to the blooms artificially. The Judges, being ignorant of the fact, awarded him the first prize, and when told of what had been done, disagreed with the majority of members, and said they were supposed to judge Roses, not foliage. At the same time those Roses that took the second prize had their foliage as grown with them.—G. DRYSON, *East Malling, near Maidstone*.

Off the schedule stated that the blooms were to be exhibited with the foliage attached, then the Judges were undoubtedly wrong, for they ought to have examined the flowers to see whether the foliage was attached or not. If there was no condition as to foliage, and the Judges awarded the prize to the best blooms, then they were right.—EDS.]

NOTES AND GLEANINGS.

MANY of the flies at this time of the year found dead on the window panes are surrounded by a white powder, which is said to be the spores of a fungus that has caused the flies to burst and die. This morning I observed several living flies running their probosces over these spores, so it is very clear how the disease is propagated.—G. S.

— AN interesting and instructive EXHIBITION of collections of EDIBLE AND POISONOUS FUNGI will be held in the Council-room at South Kensington on Wednesday, October 7th, when prizes amounting to £28 will be competed for in the following classes—viz., Class 1, Collection of Fungi arranged according to their botanical affinities. Neat arrangement and correct nomenclature will be taken into account in awarding the prizes. The edible and poisonous species are to be so marked on their respective labels; the edible species being named on white labels, the poisonous on red labels, the rest on yellow labels. Prizes £5, £3, £2. Class 2, Collection of Edible Fungi. These should be shown when possible in juxtaposition with specimens of similar but noxious species. Prizes £3, £2, £1. Class 3, Collection of New or Rare Fungi. Prizes £3, £2, £1. Class 4, Cultivated Edible Fungi. This class is intended for species likely to be useful as esculents, but which are not now known in the cultivated state. Prizes £3, £2, £1.

— THE importation during 1873 of Potatoes, 7,506,615 cwt. of the value of £2,120,151, being an increase over that of the previous year of 25 per cent in quantity, and 29 per cent in value. Of eggs, 660 millions were imported, being an increase of 21 per cent in quantity, and the increase in their value was 33 per cent.

NOTES ON VILLA AND SUBURBAN GARDENING.

Annuals.—In those days when annuals were used either in combination with herbaceous plants, or in masses in beds by themselves, for the decoration of the garden, they were thought highly of, and were treated with something like the care they deserved; for many, if not most, of the varieties in repute at that time—that is, before the Geranium was so much used for bedding, were, by sowing at different times in the year, grown so as to keep a garden gay throughout the spring, summer, and autumn months. True, there always is in such things considerable labour in keeping them in their highest trim, such as picking seed-pods off, regulating the growth, and picking out those plants which show an inclination to depart from the original variety, a circumstance so frequently occurring in seedlings of that kind; but this labour is not more than other plants of the present day require, and the blooming powers of an annual are extraordinary, and well repay the trouble. I am glad, however, to see that annuals are regaining their lost ground, and are fast growing into favour again. It has been my lot to witness on several occasions the gay appearance of some gardens from growing a collection of annuals, and these some of the most common among them; quite hardy too, and their treatment of the simplest kind—so much so, that no one need fear a failure in a first attempt at their cultivation. As this is the time of year to sow those sorts to which I allude, I intend giving the names of a few I have grown for years and of which I have proved the qualities for the decoration of a suburban garden (I have not the remotest idea that annuals will ever take the place of those plants at present used for beds; but for the spring there is as yet nothing so beautiful as some of them), adding a short description of each for the guidance of those who desire them.

First of all I must state that it is necessary to prepare a piece

of ground for the seed; and I would advise this, that the seed be sown in close quarters, as I presume that to those for whom I write space is valuable. Each sort should be separated from the others by a narrow path trampled out with the foot, and the seed sown in the most careful manner, so that none of it springs over the bounds and becomes mixed with its neighbour, which at the blooming time would produce confusion and disappointment. The soil need not be of the richest kind, nor the very poorest, but such as has grown a crop of Potatoes, for instance, would possess staple sufficient to carry them over the winter without the addition of any manure. The ground should at all events be in a sheltered aspect, a southern one if possible, and be dug deeply and marked out as above described. Some of the seed being very small—that of *Silene pendula* for instance—such species will not require so much space for the same number of plants as the larger sorts, therefore a bed for each may be allotted as the sowing goes on, marked out, and every sort named accordingly. Now, as there are some annuals the seeds of which vegetate better if the soil is worked down very fine, it will be desirable, unless the soil is unusually heavy, for it all to be worked down, and then push a quantity of it back with the rake, to be afterwards returned when the seed is sown. This is a safer method to ensure the covering of the seed than first sowing on the surface and then raking it in, as much of it is then pretty sure not to be buried.

If the weather is moist and warm the seeds are not long in coming up; then comes a little attention in order to keep away snails, which will speedily attack some of them. Use lime mixed with soot in equal proportions to prevent injury from that cause.

Now as to the annuals to be sown, beginning first with *Nemophilas*. *Insignis* and *maculata* do not exceed a foot in height; they are rather impatient of too much wet, and should therefore have the driest place; the colour is blue, and blue and white spotted sometimes. These are sown a month earlier, and then transplanted in autumn, but I advise their standing in the seed bed during winter. *Lasthenia californica*, a splendid bright yellow flower, grows in a sort of tuft-like form about a foot high, and is suitable for large borders in front of a shrubbery or round the base of a specimen evergreen. Then there are the *Lupines*; *nanus* (white and blue varieties) is dwarf, but tricolor is a tall one. *Limnanthes Douglasii* is among the hardiest of all annuals; it has more of a straw-coloured blossom, flowers abundantly, and will grow almost anywhere; it is about a foot high. *Collinsias bicolor*, *grandiflora*, and *verna* are well known to be very beautiful, and make good blue and white beds; they grow about 15 inches high. *Silene pendula* and *pendula alba* may both be used with great success; the former is a pink and the other whitish, or perhaps I ought to say cream colour. These are plants of the hardiest description, spreading habit, and are excellent for beds, clumps, baskets, or rockwork, and grow about 15 inches high. *Saponaria calabrica* is another plant of the easiest culture, and, to my thinking, the most beautiful of all of this class of hardy annuals when grown in a mass, such as a bed, or in a line with others in a border. As it grows it becomes very compact, and produces thousands of tiny bright pink flowers, and the most lasting of any. The plant is a foot high. Next we come to the *Forget-me-not*, a fine blue colour, well known to be one of the best decorative plants for spring gardening; it grows well in clumps or rockwork, in beds or baskets, and is about a foot high. *Virginian Stock* is a pretty little annual of dwarf growth and much sought after; about 5 inches high. *Eucharidium grandiflorum*, purple, about 1 foot high, is fine for small beds and borders. *Eutoca viscida* is also a dwarf grower, and would be much admired in patches or beds; 1 foot high, blue. *Leptosiphon densiflorus*, purplish colour, is low-growing, and compact. Now comes *Clarkia pulchella*, a very hardy annual of a purple colour, a foot high, one of the best; there is a white variety also good and worthy of cultivation.

I have now named about a dozen of the most varied colours; the plants compact in habit and free in flowering, and such as will be sure to please. There are several tall-growing sorts, such as *Godetia Lindleyana*, rose; and *rubicunda*, rose with a red centre; *Erysimum Peroffskianum*, orange, and some others which I have not named owing to their being of too tall and spreading habit for small gardens, but which, if desired, would afford a quantity of cut blooms. I am sure with what I have named a great display may be made in the spring. Some of them do not bear well too much wet, and others do not succeed so well if planted in their flowering quarters in autumn, as they are liable to die off. My object has been to advise the sowing of them rather later in the way above recommended, and letting them stand in the seed beds all through the winter, where, if heavy snow and frost come on, the whole can be protected by hoops and mats, or any other means at command, and during that time the beds and borders that are to receive the plants can be turned-up to the action of the weather and become pulverised and sweet. About the middle of March transfer them to the garden in small patches, and they will at once after watering start into growth with no further trouble and flower abundantly. While

in the seed bed, if the weather should prove mild, the coarsest of them will be the better of a little punching-back; they will then transplant all the better and flower quite as well.—THOMAS RECORD.

DOINGS OF THE LAST AND PRESENT WEEKS.

KITCHEN GARDEN.

DIGGING, trenching, and making alterations. The weather has been very favourable for all these operations, and it is highly important to get all such work done as soon as possible. We have had very little rain during the last four weeks, but sufficient to moisten the ground, and this caused the autumn-sown seeds of Lettuce, Cabbage, Onions, Cauliflowers, &c., to vegetate freely. There are few vegetables more esteemed in the late spring and early summer months than Cauliflowers, and it is very desirable to get them in at as early a date as possible. Our earliest are planted out on a south or east border, or, failing this, in as warm a position as possible; and to insure success, the ground has been trenched and well manured, and the plants are carefully put out with a trowel. A later sowing is pricked-out in boxes, and these are just sheltered by glass lights from severe frosts or heavy pelting rains. At all other times the lights are removed. Spare plants may be pricked-out in a bed of fine, but not rich, soil out of doors, and about the best position for them is under a south wall. Lettuce plants will also be put out on a south border, and in a more exposed position as well. A succession of vegetables may be obtained not only by sowing at different times, but also by planting in different positions. Attention should also be given to securing a northerly aspect; indeed in light shallow soils it is not possible to obtain a supply of crisp wholesome vegetables during the dog-days without being so favoured. Strawberry plants have not grown so freely this year. Small-sized plants invariably produce the best and largest fruit. Large plants produce a quantity, but from being more shaded by the leaves are not so good. Removing superfluous Raspberry canes, as well as those which have borne fruit. It is much better also to tie the canes in a position where they can have the full benefit of light and air. The best way to treat Raspberries is to plant in rows 1 foot apart, and at the distance of 2 or 2½ feet between the plants; the canes to be trained at regular distances to a wire strained horizontally at 3 feet from the surface of the ground.

FRUIT AND FORCING HOUSES.

Vinerias.—We can only reiterate the instructions given in previous numbers about the care requisite to preserve ripe Grapes in late vinerias, and also to see that inside borders do not suffer from want of water; but this ought to have been seen to early in September at the latest, as watering the borders now would be a predisposing cause to damp, and injuriously affect the berries. Black Grapes are not so readily affected by mould as white. There is not much trouble to keep Black Hamburgs, or even Black Muscat of Alexandria, until Christmas; yet Royal Vineyard, Syrian, White Tokay, and others recommended as keepers are constantly having mouldy berries cut out from the bunches. There is not much said about White Lady Downe's, which was stated to keep quite as well if not better than the black variety. It has been pretty generally planted, and must have been sufficiently proved now.

We are getting compost ready for surface-dressing the borders of the early houses. Where the roots are much restricted it should be rich, and where attention is given to annual dressings a very limited extent of border will suffice to maintain Vines in health for many years; indeed better Grapes are sometimes produced from such borders than from those where the roots have an unlimited range. The dressings used here are prepared in the following manner:—Cow and stable manure is collected as it can be obtained, and thrown into a heap to ferment, but not to the extent of drying it. When the violent heat has subsided the manure is mixed with an equal proportion of turfy loam, and laid up in a heap, where it will again heat, so that the loam will become incorporated with the ammonia. This mixture is used to dress borders where the roots are not much restricted. In very much confined borders a 12-inch potful of guano, or twice the quantity of pigeon dung, is added to each barrowload of the mixture.

The extension of borders is required from time to time when young Vines have been planted to allow of it. A range of vinerias at Loxford was erected on very unsuitable soil with a wet subsoil. Plenty of drainage was put in; and as the Vines would not have thriven if the roots had got into the natural soil, a 9 inch wall was built in front of the border. This is taken down and rebuilt at a distance of from 4 to 8 feet; but before adding the material, which had been previously prepared, a foot at least of brickbats should be placed underneath, and over this some turves with the grass side down. After filling-in the compost to within a foot or 18 inches of the surface some of the roots should be spread out over it, and the remainder a little nearer the surface. Instructions how to prepare the compost have been given in previous numbers. If it is intended to force

Vines about the middle of November, they should be at once pruned.

Strawberry Plants for Forcing.—From the time these are cut from the parent plant until they are taken under glass, the pots always stand in an open position fully exposed to the sun. This year the crowns are already very prominent. It is sometimes necessary to place the plants in an unsuitable position, and also to crowd them too closely together. It is in the case the plants would be much benefited by being placed on an open spot in the kitchen garden from which any crops have been removed. We do not water so freely now, only plants that are really dry are watered. The plants of Black Prince intended for early forcing should be on a south border, or where they can at least have the full benefit of the sun.

PLANT STOVE.

In our house there is a mixed collection of plants of opposite character and requirements—Phalenopside and Nepenthes needing deep shade; and Palms, as well as hardwooded plants requiring all the sunshine that can be obtained. Then we have of Ferns, Adiantums such as *A. trapeziforme*, macrophyllum, cuneatum, &c., which require to be screened from the sun for an hour or two in the middle of the day in hot summer weather, and to have no shade after September. A farleyense, Sancte-Catherine, the Gold and Silver Gymnogrammas, and many others, suffer severely from even moderate sunshine. This is very often the way that many gardeners are situated, but we must make the best we can of our difficulties. All plants requiring shade must be placed in one part of the house, and those requiring sunshine at the side where they can have the full benefit of it. Amongst the Orchid family, the Moth Orchid, Cypripediums, and a few of the more delicate-leaved Odontoglossums, require shade. Vandas and Saccolabiums are not yet able to stand the full exposure. Cattleyas, Aërides, and Dendrobiums should stand or be hung up close to the glass in the full sun.

All plants that require repotting should be attended to at once, as only a very few of the fastest-growing hardy plants should be potted after this time.

Orchids from the cool regions of New Grenada, of which so many beautiful species are now in cultivation, such as *Masdevallias*, *Odontoglossum crispum*, *O. triumphans*, &c., have been removed from the cold frame under the north wall to a heated span-roofed structure, where they will stand during winter and spring. At no season is a high temperature necessary. A minimum of 45° is the best for the next six months. One often sees these fine Orchids grown in a too high than in a too low temperature. Many persons fancy that because they are Orchids that they must be grown in a high temperature. Nothing is more erroneous: a high temperature in winter will ruin the constitution of such plants. *Poinsettia pulcherrima*, which has been until now grown in a greenhouse temperature, with air on night and day, is now in a stove temperature, and a little weak manure water, or surface-dressing with some rich compost, causes the leaves to retain a green colour. One often sees this fine plant disfigured by the loss of three parts of its leaves, a few sickly specimens alone remaining at the top of the growth when the rich crimson-coloured floral bracts appear.—J. DOUGLAS.

TO CORRESPONDENTS.

* * It is particularly requested that no communication be addressed privately to either of the Editors of this Journal. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably.

BOOKS (T. D.).—The "Cottage Gardeners' Dictionary" may be obtained at our office for 6s. 6d., or free by post 7s. 2d. Lindley's "Guide to the Orchard and Kitchen Garden" we think is out of print; it and London's "Hortus Britannicus" were published by Messrs. Longman. We do not know at what price you can obtain them second-hand.

SALARIES (Beta).—The parties are quite capable of taking care of their own interests.

FRENCH GARDENING MAGAZINES (*H. B.*).—"Revue Horticole," published at Rue Jacob 20, Paris, and "Flore des Serres," by Louis Van Houtte, at Ghent.

CUT FLOWERS FADING QUICKLY (*Gamma Rose*).—We did not publish on the day you name, nor do we remember the recipe. No one could tell the cause of failure unless he knew all particulars.

SEEDLING APPLE (*James Cuthbush & Son*).—The specimen Apple sent is very handsome, and although the flavour is not so good as to recommend it for dessert use, it would be a useful kitchen Apple. The great beauty of its colouring would make it sell well at market.

STORING POTATOES (*R. J. B.*).—Store them in a dry cellar or substantial outhouse, in layers alternating with sand, and covering all with 2 inches in depth of sand.

WHITE FOOTSTIGAN GRAPE (*Mrs. C. W.*).—It will succeed in your cool greenhouse with a south aspect. It deserves the warmest end.

SMALL GREENHOUSE (*T. A. G.*).—No paraffin lamp would exclude frost from the plants, nor could any other source of heat be employed that produced fumes from burning oil, or coal, or gas, unless those fumes could be conveyed by a funnel into the air outside. The fumes would injure and kill the plants. A gas stove would be your best aid.

STORING NETS (*V. torquatus*).—Do not remove the hanks, and put them in jars in layers alternating with sand, and keep in a cellar.

AMARANTHUS HENDERSONII (*J. H.*).—It was exhibited and commended at one of the recent meetings of the Royal Horticultural Society's Floral Committee, and was very showy and effective, presenting great brilliancy and diversity of colour, and the habit, too, was good. No doubt the plants make a brilliant display. When used as table decorations, the contrast of their brilliant colours against the white tablecloth could not fail to be effective. One or two plants of the group appeared to be distinct, the carmine and orange being more vivid, and the dark part much nearer to black. Those varieties we think ought to be propagated from cuttings and named.

ALLOWANCE FOR WEAR AND TEAR OF GLASS STRUCTURES.—MANURE FOR VINE BORDER (*T. H. T.*).—The loss with glass structures is great. They are worth about fifteen years' purchase, more or less according to the substantiality of the structures, but fifteen years is a fair average, and the wear in that time is about equal to the first cost of wood, glass, &c., equivalent to about 64 per cent. per annum. Poultry manure is a good dressing for a Vine border. One bushel per 50 square yards is a sufficient quantity to apply at a time, and is equal to about six bushels of soft bedded manure.

WINTER-DRESSING PEACH TREES (*Id. m.*).—Soft soap 1 lb., flowers of sulphur 1 lb., tobacco pipe-rod gullion, and a wine-glassful of spirits of turpentine well mixed, boiling for about a quarter of an hour, and applying to the trees with a brush at a temperature of 12° to 130°, brushing it well into every hole and crevice, taking care not to dislocate the buds. It should be applied when the trees are at rest, before the buds have begun to swell.

ARTIFICIAL MANURE FOR HAY CROP (*Idem*).—Probably for a hay crop the best manure next to that from the farmyard, is guano, 2 cwt. per acre, applied during moist weather at the close of March or early in April.

HEATING GREENHOUSE (*S. N.*).—You could well heat your greenhouse with a stove, as it would dry the atmosphere too much, but it might be heated by a slow-combustion stove-boiler within the house, having two 2-inch flow-pipes, and the same number of return pipes along one end and the front, having the boiler within the house, and its smoke-chimney taken to the external air clear of woodwork. Write to one of those advertising in our columns stating what you require.

KEEPING GERANIUMS STOCKY.—VIOLE CORNUTA HARDINESS (*Tertia*).—The Geraniums will be kept stiff if they be stopped when about 4 inches high, and each succeeding growth afterwards up to April, keeping near the glass, and giving air whenever the weather is mild. They should not be buddled together, but have room to grow. *Viola cornuta* is perfectly hardy even in exposed situations, the plants being well rooted and established before winter. Your flowers were all crushed; we cannot tell from leaves.

GRAPES NOT COLORING (*L. H.*).—Your bunches of Black Hamburgh Grapes with some berries quite black and others red and withered, are shanked. The cause is mainly an insufficiency of foliage arising from a deficiency of sap, the roots not supplying enough to meet the requirements of the Vines in a dry and hot period. Probably more air, a greater amount of foliage, and not overwatering, would do much to remedy the evil in future. The low and shady situation is not good; but the soil and subsoil appear suitable. The Geraniums thinly planted may not do any great harm, but the border would be better without them, as they will deprive it of much air and warmth. Give the border a dressing of bones (half-inch), an inch thick, pointing them in with a fork, and in spring dress it with soot, making it quite black; when the Lonicas are well set, and also when taking the second swelling before colouring, apply one peck of guano to 20 square yards, and give a thorough watering at a temperature of 75° immediately after each application of guano. Plant the Vine in the outside border the early part of March, before the eyes swell.

WINTERING LOBELIAS.—DAILIAS FROM CUTTINGS (*Chee*).—Lobelias of the dwarf bedding or Etruscan section will not winter safely in a cold frame. The only ones that winter finely in a cold frame are the herbaceous kinds now but little grown. It is a waste of space to winter Lobelias; they are raised so easily from seed, make better plants, bloom longer, withstand drought better, and come so true to name. Some kinds it may be desirable to winter, but only those of which seed cannot cheaply and safely be had, as some of the new kinds. Dailias are best raised from root-cuttings; the shoots when 3 or 4 inches long being taken off with a heel or small portion of the old tuber, and struck in small pots in gentle heat. The main thing is to strike rather early, say February or early in March. When well rooted remove to a cool house, keeping well aired, with plenty of light and room, shifting into larger pots as required, so as to have good, stiff, strong, hardy plants for planting-out in May.

TEMPERATURE FOR STOVE FERNS (*J. C. N.*).—All stove Ferns may be grown well in a good stove in winter November to January inclusive, 55° at night and 60° by day. February to May 5° higher. June to August 10° higher, on both the night and day temperatures first mentioned; and September and October 5° less than from June to August. From October to February inclusive the temperature by day may rise 5° to 10° with sun and air, and from March to September 10° to 15° or 20°, according to the sun heat, giving air moderately, and in proportion to the amount of sun heat, and affording moisture corresponding to the increased temperature.

HIGH RENT (*W.*).—The rent you are to pay for your plot of ground will prevent you from making more of it than a hobby, though you might by working it yourself be able to grow some vegetables for your own use that would give you some return for your outlay. It is useless, however, thinking of making it pay at a rental equal to £75 per acre. By growing a few such things as Cabbage, Cauliflowers, early Potatoes, to be followed by Brussels Sprouts and Savoy for winter, with Celery, a few Peas, Dwarf Kidney Beans, and Scarlet Runners, you may supply yourself with most of what you need in vegetables, and thus have some return for rent, besides the pleasure and health-giving employment of cultivating them. It would be better than allowing the ground to remain idle.

TRAINING AND MANURING VINES (*H. P.*).—Vines trained upright are best treated on the spur system, which insures their breaking regularly, the tops of the rods being depressed before they start. The border is best dressed with manure whilst the Vines are at rest.

GLOXINIA SEEDLINGS (*W. J. B.*).—We should shift the largest plants into 6-inch, and the next size into 4½-inch pots, and it is likely they will flower this month and onwards in a light airy position in the stove, probably up to Christmas, when they may be kept drier, and they will again in February or March start fresh shoots from the base. The old shoots dying away should be removed when the young ones are advanced an inch. For the supports in the conservatory, *Mimosa prostrata*, *Acaëa oleifolia elegans*, and *Habrothamnus fasciculatus*.

TRENTHAM BLACK GRAPE.—LILY OF THE VALLEY FORCING FOR CHRISTMAS (*A. B. C.*).—The smallness of the berries of Trentham Black is probably due to the vigour of the Vine; but from what you say we do not think you have it true, as it is a free setter, and the berries are large and oval. The Lily of the Valley should be placed in gentle heat the middle of November, and if possible a bottom heat of 65° to 70°, and a top heat 55° to 65°. *Lilium auratum* should be potted when the stems turn yellow, and the pots ought to be placed in a cool house or frame safe from frost. Instructions for potting, &c., have been repeatedly given.

SELECT NEW BEEDING GERANIUMS (*F. E. J.*).—Yours is a somewhat difficult question to answer, as there are so many diversities of opinion as to what is new. Some gardeners think that a plant two years old has become almost obsolete, other gardeners that any plant is new if they themselves have only just obtained it. The best new *Scarlets*, including *Crimsons*, are Edward Sutton, General Outram, Harry King, a seedling from Jean Sisley and very like it. *Magenta*.—Not many good new ones of this colour. *Mias Saunders* is good, so is *Isabella*, but truss not large enough. *Pink*.—In this colour Mr. Pearson of Chilwell has given us a great many good kinds, as *Mrs. Taite*, *Contessa Quarto*, *Mrs. Holden*, *Augusta Miles*, *Cannell's Master Christine* is also good, though it drops its petals in hot sun. *White*.—Well, the less said about whites the better; we have never seen a really good white yet, all turn pink in the sun; none is better yet than *Madame Vaucher*.

GLADIOLUS (*T. Simpson, York*).—The spikes which you sent us are fine, and some of them quite equal to named varieties, notwithstanding, as you remark, the bulk of them having been injured by wind and rain.

NAMES OF FRUITES (*T. F.*).—Flemish Beauty. (*W. Foote*).—King Edward's Pear, or more properly, Edwards' King. (*A. B. G.*).—Golden Winter Pearmain, or as it is commonly called, King of the Pippins. (*Horace Huntley*).—White Nonpareil. (*G. Dix*).—1, Urbaniste; 2, Triomphe de Jodoigne; 3, Vicar of Winkfield; 4, Beurre Diel. (*W. S. G.*).—1, Easter Beurre; 2, Chantanelle; 4, Beurre Diel; 5, Vicar of Winkfield. It is quite clear that, judging from the specimens sent, these varieties do not succeed in your district. You ought to graft the trees with varieties better adapted for it, and if you decide upon doing so we will be pleased to furnish you with the names of the varieties which will succeed better. (*Chas. T. Hall*).—Your Grape is very curious, and resembles a small black Tomato. It is, in fact, a combination of two ovaries, in which the sutures of the carpels are so marked as to give the fruit the appearance it has. *Pears*: 1, Beurre de Rance; 2, Beurre de Capiaumont; 3, Fondante d'Automne; 4, Haupden's Bergamot. The malformed Pear is caused by a prolongation of the axis in which there has been first an arrest of growth, and the calycinal segments are developed into leaves. *Apples*: Collini. (*A. Learner*).—1, Marie Louise; 2, Crasane; 3, Beurre Diel; 7, Bellissime d'Hiver; 9, Downton; 10, Ne Plus Meuris. (*C. W.*).—All the Apples which you have sent from an orchard in the west of England are cider Apples, which we cannot undertake to name. No. 2 is Kingston Black; No. 10 is not Manks Collini; No. 7, Chantanelle Pear; 1, Louise Bonne of Jersey Pear; 2, Marie Louise; 3, Beurre de Capiaumont; 4, Duchesse d'Angoulême. (*W. T.*).—Brickley Seedling. (*W. H. P.*).—1, Winter Nels; 2, Figue de Naples; 3, Vicar of Winkfield; 4, Beurre Diel; 5, Passe Colmar; 6, Knight's Monarch. We cannot make anything of the Grape, which is quite smashed. It appears like *Isabella*, an American variety. *Pears*: 1, Beurre de Rance; 2, Duchesse d'Angoulême; 3, Beurre Diel; 6, Winter Nels. (*E. Norwich*).—Your Plum is Queen Mother, a dessert variety. (*Hurst & Son*).—1, Beurre Clairgeau; 2, Duchesse d'Angoulême; 3, Fondante des Bois; 4, Fondante du Comice; 5, Enfant Prodigue. (*Thos. H. Sykes*).—Beurre Amande. (*Shrublands*).—Collini. (*Hogg & Wood*).—We cannot distinguish the Apple, it is evidently an imperfect specimen. (*W. C. D.*). 1, Golden Winter Pearmain; 2, Winter Greening; 3, Unknown; 4, Keswick Collini; 6, Nancy Jackson. (*E. S. Turner*).—The leaf is that of *Liquidambar styraciflua*. A, Fondante de Noël; B, Easter Beurre; C, Knight's Monarch; D, Carrel's Seedling; E, Not known; F, Winter Nels. (*P. Bennett*).—1, White Summer Calville; 2, Birmingham Stone Pippin; 3, Gravenstein; 4, Autumn Pearmain. (*H. M.*).—1, Beurre Clairgeau; 3, Easter Beurre; 4, Louise Bonne of Jersey; 5, Summer Franc Real; 6, Comte de Launay. (*L. J. B.*).—1, Nonesuch; 3, Flushing Spitzenburgh; 4, Fearn's Pippin; 5, Golden Noddy; 6, De Neige. (*T. E.*).—1, Norfolk Storing; 2, Stamford Pippin; 3, Fondante d'Automne; 4, London Sugar.

NAMES OF PLANTS (*W. A. Mount Chisley*).—It is a Fungus, *Peziza aurantia*. (*J. Bab*).—You have not numbered the specimens of Ferns, so it would be useless to publish the names. (*R. A. P.*).—*Betula asplenifolia*, *Asplenium-lanceolatum* Birch. It is hardy. (*X. Y. Z.*).—1 and 4, *Sedum Telephium*; 2, *Achillea tanacetifolia*; 3, *Alchemilla vulgaris*; 5, *Adiantum cuneatum* (?); 6, *Ruscus androgynus* (?), two flowers. (*H. P.*).—20, *Tyrus japonica*, var.; 19, *Sollya heterophylla*; 18, *Campylopus* (material insufficient); 21, *Gaillardia bicolor*, var. *Drummondii* ("Bot. Mag.") 3551. (*O. O.*).—*Dorea* sp. (no fruit); 2, *Davallia (Laciniata)* *gibbosa*; 3, *Verbascum Blattaria*. It is an unusual occurrence. (*Inquirendo*).—Apparently *Scilla maritima*, but your description and drawing are insufficient. (*T. H.*).—We only name six specimens at a time, you send seventeen: 2, *Doodia humulata*; 5, *Nephrodium molle*; 6, *Pteris serrulata*; 7, *Phlebodium aureum*; 9, *Adiantum bispidulum*; 13, *Adiantum cuneatum*.

POULTRY, BEE, AND PIGEON CHRONICLE.

OUTRAGES ON PRIZE POULTRY.

On the 8th inst. I sent to the Farnworth Show a valuable pen of Duckwing Game chickens, where they obtained the first prize. The birds when sent back from Farnworth were all right, but upon their arrival home I found that some rascal had pulled both sickle feathers out of the cockerel's tail. Now this could not have been done by accident, for the bird is young and his sickles were not full grown, being about 2 inches shorter than the straight feathers. This almost convinces me that the bird must have been taken out of the hamper, most probably at the Worcester station, and the feathers abstracted; as Mr. Hewitt, who officiated as Judge at the Show, informs me that the bird's tail was not only right when he judged him, but just prior to his leaving for Birmingham, when he again visited the show tent, the bird was perfect. I believe the injury to be the work of some malicious scoundrel to prevent good birds winning and beating his own. My first-prize Black Red cock at the late Hereford Show had both his sickles broken off, and I am constrained to believe both to be the work of the same hands. I am not able to attend shows with my birds. I should feel obliged if any amateur would kindly be on the look-out, and I would gladly give a guinea to anyone for information to enable me to bring the offender to justice.—JOE MASON, *St John's, Worcester.*

[We fully sympathise with Mr. Mason, and will readily aid in detecting the miscreants. Prevention of crime rather than its punishment being preferable, we suggest that the baskets containing exhibition poultry should be canvas lined; the lid with an edge descending over the side and secured by a padlock, a key of which might be sent by post to the secretary and returned by post by him.—EBS.]

LONG SUTTON POULTRY SHOW.

THE Long Sutton Agricultural Society has several times been unfortunate as regards the weather at the time of the Show. This year it was so again; for soon after the opening, heavy rain came down for some hours, and although it cleared up again, the ground was so saturated that the comfort and pleasure of sight-seeing were spoiled, and doubtless the Society also suffered pecuniarily. However, the fowls were in very good shelter, so that they did not suffer from the rain. They were well fed and attended to, although we think if less paste and more barley had been given it would have been better, as the paste, when supplied in large quantities, has a great tendency to make the pens dirty and uncomfortable. The prizes for poultry were awarded by Mr. Teehay, and those for Rabbits and Pigeons by Mr. F. C. Esquilant. Instead of cups the Long Sutton Society have adopted a system of giving extra prizes of three guineas or two guineas to each section of classes throughout the Show.

The *Dorking* classes were fairly good, but it struck us that the extra-prize bird was in the wrong pen. The occupant of that pen should have been a chicken, whereas the winner of the prize was an old bird, a great deal like one belonging to the owner of pen No. 2, Mr. Moritt, of Gooles. The first-prize Coloured hen was very large. The principal *Cochin* prizes were awarded to young birds, Mr. Lingwood being the winner of the extra with a very promising young Buff cockerel. Mr. Sidgwick's birds were both good and deserving. Mr. Derry showed a very fine Partridge hen, which won the first prize. Mr. Lingwood won another extra prize with one of his wonderful Dark *Brahma* cockerels; Mr. Garner's second-prize bird being of a very similar stamp. In *Brahma* hens the first prize was won by a very beautiful pullet, which will, we think, be very difficult to beat. She was entered at the low price of three guineas. The Light *Brahma* classes were large, and both the first-prize birds were excellent, being particularly good in colour and in shape. The *Hamburg* classes were very good. The extra prize was for some time placed on Mr. Ward's pen, a nice Golden-spangled; this was, however, discovered to be a mistake, and it was eventually placed on Mr. Beldon's Silver cockerel, an extra good bird, with plenty of marking, and very good in comb and ears. Most of the Spangled *Hamburg* prizes went to Silvers; the first and second pullets being very perfect; the third a rich Golden. In the Pencilled classes, however, the prizes went just the opposite way, five out of six being Golden. The *Game* classes contained some good birds, but many of the best were either too young or else not in good-enough feather for exhibition. The *Spanish* classes were almost exclusively composed of adult birds. The extra prize was won by a fine hen, which we thought, however, rather coarse in face. The *French* and *Polish* classes were good but small, many of the best birds being in full moult, and this detracts much from the beauty of the show pen. The best birds in the Variety class were the Black *Hamburgs*, which were very good.

In the *Game Bantams* the special prize was won by a smart young Black Red cock very well shown. The second-prize bird was also a capital one. Mr. Entwistle's highly commended pen was a bird of good shape and colour. In hens the winners were very good, and all, we think, were this year's birds. In *Game Bantam* cocks, any other variety, a very nice Duckwing was first, second being a Brown Red, and third a stylish Pile undoubted. In the hen class a Pile was first. In Black *Bantams* Mr. Beldon won another extra prize with a nice pair. In the Variety class first and second were Golden, third nice Whites.

The *Ducks* were very good classes. The *Selling* classes were well filled; several pens were, however, rather poor. The prize birds were good.

PIGEONS.—Coming to the Pigeons, the best and largest class amongst the *Carriers* was that for birds of this year, many of which were very promising. The other classes were, however, very good, and the *Pouters* were also very nice birds. The *Trumpeter* class was a good one; so was that for *Fantails*, which were all White. *Almonds* were capital, and White African took both prizes in the *Owl* class. The *Barb* classes were large and contained a lot of capital birds, but we did not think the class for this year's birds was anything very extra. The *Turbit* class was good, and Mr. P. H. Jones's Silvers were very fine. In the Variety class first were Pigmy Pouters, second Turbitteens.

RABBITS were capital, amongst the best being Mr. Boissier's Tortoiseshell doe and Mr. Swetnam's Angora doe. The Sale class contained some cheap animals.

DORKINGS (Coloured).—Cock.—1, L. Wren, Lowestoft; 2, J. E. Pilgrim, Hinchley. Hen.—1, O. E. Cresswell, 2, L. Wren.

COCHINS (Cinnamon or Buff).—Cock.—Extra, Henry Lingwood, 2, C. Sidgwick, Kingley. 3, E. Winwood, Worcester. Hen.—1, Mrs. Bentley, Upper Teddington. 2, C. Sidgwick, 3, E. Winwood, Henry Lingwood. 4, G. Freeman, Gosherton Spalding.

COCHIN-CHINA (Any other variety).—Cock.—1, R. S. Woodgate, Pembury, Tunbridge Wells. 2, C. Sidgwick, 3, T. Aspin, Church. Hen.—1, C. Bloodworth, Bay's Hill, Cheltenham. Hen.—1, T. M. Derry, Gidney. 2, C. Bloodworth, Cheltenham. 3, J. A. Sleep, Kingsland, London. 4, C. Sidgwick, 5, T. Aspin, 6, J. Bloodworth.

BRAHMAS (Dark).—Cock.—Extra, Horace Lingwood, Cretingham, Northam Market. 2, W. R. Garner, Dyke, near Bourn. 3, Rev. R. L. Sorey, Lockington Vicarage, Derby. Hen.—1 and 3, Rev. T. C. Peake, Hallaton Rectory, Uppingham. 2, Horace Lingwood, 4, J. Harvey, jun., Thimington, Canterbury; 5, Lantour, Hexton, Amphill; 6, Fritchard, Tettenhall, Wolverhampton. 7, G. W. Petter, Streatham Grove, Norwood.

BRAHMAS (Light).—Cock.—1, G. W. Petter, 2, R. E. Hor-fall, Grassendale Priory, Liverpool. 3, Mrs. Peet, Searnbrook, 4, P. Haines, Palgrave, Diss. Hen.—1, Mrs. Peet, 2, G. W. Petter, 3, J. Bloodworth, 4, Horace Lingwood; 5, P. Haines; 6, J. Bloodworth; 7, J. T. Hincks, 8, W. H. Garnish, Avenue Road, Acton.

HAMBURG (Gold or Silver-spangled).—Cock.—Extra, H. Beldon, Giltstock, Bingley. 2, J. Gee, 3, W. K. Tucker, Ipswich. Hen.—1, T. & W. Fawcett, Beldon. 2, H. Beldon. 3, J. Ward, Bardon Hill, Ashby-de-la-Zouch. 4, W. H. Lindsey, Great Yarmouth.

HAMBURG (Gold or Silver-pencilled).—Cock.—1, H. Beldon. 2, C. J. N. Row, Melford. 3, C. W. Gibbs, Sutton Bridge. 4, T. & W. Fawcett. Hen.—1 and 3, H. Beldon, Giltstock, Bingley. 2, A. F. Faulkner, 4, W. K. Tucker; 5, Smallpage, Coln.

GAME (Black Red).—Cock.—Extra, H. Beldon. 2, S. Matthew, Stowmarket. 3, G. H. Fitz-Herbert, Sevenoaks. Hen.—1, G. H. Fitz-Herbert, 2, S. Matthew, 3, B. Mollet.

GAME (Black Red, any variety).—Cock.—1, J. Cock, St. John's, Worcester. 2, H. Beldon, 3, E. Martin, Sculthorpe. Hen.—1, J. Nelson, Cockshaw, Hexham; 2, H. Wrist, 3, J. Nelson. 2, S. Matthew, 3, H. Beldon. 4, W. Kirby, Hugglescote, Ashby-de-la-Zouch.

SPANISH.—Cock.—1, H. Beldon. 2, J. Laming, Broughton, Preston. 3, W. Nuttage, Northampton. Hen.—Extra, J. Laming, 2, W. Woodhouse, King's Lynn. 3, Mrs. Tomsin, 4, W. Nuttage.

FRENCH.—Cock.—1, W. Cutlack, jun., Littleport (near Great). 2, W. Dring, Faversham (Roadan). 3, G. W. Hibbert, Goudy, Hyde. Hen.—1, G. W. Hibbert, 2, W. Cutlack, jun. (Roadan). 3, E. Lantour (near Great).

POLANDS.—Cock.—1, H. Beldon. 2, W. Boothby, Louth. Hen.—1, H. Beldon. 2, G. W. Boothby. 3, O. E. Cresswell, 4, T. C. Seabitt, Epworth.

ANY OTHER DISTINCT VARIETY.—Cock.—1, H. Beldon. 2, A. J. Sharp, Spalding. 3, R. S. Woodgate. Hen.—1, H. Beldon. 2, R. S. Woodgate, 3, W. Cutlack, jun. 4, T. L. Nash, Sproughton.

BANTAMS (Game, Black-breasted).—Cock.—Extra, W. F. Addie, Fishergate, Preston. 2, J. Nelson. 3, Wells & Sherrin, 4, J. Nelson; W. F. Entwistle, Bradford. Hen.—1, W. F. Addie, 2, J. Nelson. 3, W. F. Entwistle, 4, W. F. Entwistle; J. Nelson.

BANTAMS (Game, any other variety).—Cock.—1, J. Nelson. 2, T. Barker, Hill End, Burnley. 3, W. F. Entwistle, 4, J. Nelson; W. F. Entwistle. Hen.—1, G. Evans, Worcester. 2 and 4, W. F. Entwistle, 3, J. Nelson, 4, W. F. Entwistle; W. Murray, Hexham.

BANTAMS (Black).—Extra, H. Beldon. 2, J. Mayo, 3, R. H. Ashton, Mottam. 4, Mrs. G. Clarke, Long Sutton.

ANY OTHER VARIETY.—1, W. Stringfield, Lowestoft (Gold-laced). 2, M. Leno, Markyate Street (Laced). 3, G. Vincent, Upper H. Roadon, Norwich (White).

DUCKS (Rouen).—Extra, W. H. Robson, Reepham. 2, J. Gee, 3, T. M. Derry, 4, J. Newton; W. Bigott, jun., Eye Hill, Eichey Junction (2); J. Nelson; W. H. Robson.

DUCKS (Aylesbury).—1, T. P. Carver, Langthorpe. 2, Miss M. C. Campain, Deeping. 3, T. Sear, St. Nicholas, Spalding. 4, W. Souche, Whitby.

DUCKS (Any other variety).—Extra and 2, M. Leno, 3, T. L. Nash.

PHEASANTS.—1 and 2, M. Leno.

ORIENTAL BIRDS.—1 and 3, G. Howes, Long Sutton (Rosella Parrot and Lincoln Cockatoo). 2 and 4, W. Jakes, Fleet, Wisbech (Rose Gallat Parrots and Major Mitchell Cockatoo).

TRICKERS.—Cock.—Extra, Mrs. E. B. Bottan, in Gidney. 2, Miss Jordan, Driffield. 3, Rev. N. J. Radley, Hollington House, Newbury. Hen.—1, Rev. N. J. Radley, 2, Mrs. E. B. Bottan.

GEES.—Gander.—1, T. M. Derry. Goose.—1, T. M. Derry.

SELLING CLASSES.—Cock.—Extra and 1, J. Franklin, Torrington, Lynn (Partridge Cochins). 3, J. Laming, 4, G. W. Petter (Brahma); Miss H. J. Maples, Spalding (Light Brahma); T. M. Derry. Hens.—1, Mrs. Peet (Light Brahma). 2, Miss E. M. Maples (Light Brahma). 3, A. Cole, Long Sutton (Cochin). 4, F. Cleaver (Light Brahma); C. G. Cave, Spalding; A. Cole (Cochin); Mrs. G. Clarke (Dorking); Miss T. M. Lowe, Wisbech (Brahma).

CROSS-BRED FOWLS OR DUCES.—1, T. P. Carver. 2, H. C. Naunton, Lynn. 3, A. Cole.

PIGEONS.

CARRIERS (Black).—Cock—1, E. Horner, Harewood, Leeds. 2, R. Fulton, Brockley Road, New Cross. *he*, W. Massey, Spalding. *Hen*—1, E. Horner. 2, R. Fulton. *he*, W. Massey; R. Fulton; E. Horner.

CARRIERS (Any other colour).—Cock—Extra and *he*, E. Horner. 2, R. Fulton. *he*, W. Massey; R. Fulton. *Hen*—1, R. Fulton. 2, E. Horner. *he*, R. Fulton; E. Horner.

CARRIERS (Any variety).—Young.—Cock or *Hen*—1, E. Horner. 2, W. Massey. *he*, W. Massey, Spalding (2); Wells & Sherwin, Spalding; A. Bullyeall, Nottingham; H. Thurlow, Burnham Market; T. Warrell, Spalding; W. Massey (3); J. E. Palmer, Peterborough.

PUTTERS.—Cock—1, P. R. Spencer, Hereford. 2, R. Fulton. *he*, A. Storrar, Peterborough; H. Simpson, Spalding; G. Holloway, jun., Stroud, Gloucestershire; R. Fulton. *Hen*—1, E. Horner. 2, R. Fulton. *he*, Mrs. Ladd, Calcestr; R. Fulton.

TRUMPETERS.—Extra and *he*, R. Fulton. 2, A. A. Vander Meersch, Lower Tooting.

FANTAILS.—1, P. R. Spencer. 2, H. Simpson. *he*, J. F. Loversidge, Newark; R. Fulton; E. Horner.

TUMBLERS (Almond).—Extra, R. Fulton. 2, H. Yardley, Birmingham. *he*, R. Fulton; E. Horner.

TUMBLERS (Any other colour).—1, J. Ford, Monkwell Street, London. 2, E. Horner. *he*, E. Beckwith, Sunderland; H. Yardley; R. Fulton.

OWLS.—1, R. Fulton. 2, T. Chambers, jun., Northampton. *he*, P. H. Jones, Fulham; R. Horner.

BARBS.—Cock—1, J. Firth, Dewsbury. 2, H. Yardley. *he*, H. B. Massey; E. Beckwith; E. Horner. *Hen*—1, H. B. Massey. 2, R. Fulton. *he*, W. Massey; T. Yardley; J. Firth; E. Horner (2). Young.—Cock or *Hen*—1, C. G. Cave. 2, W. Massey. *he*, J. Firth.

ANTWERPS.—1, H. Yardley. 2, W. Gamon, Chester.

JACOBINS.—1 and 2, R. Fulton. *he*, T. W. Dows, Boston.

THE POULTRY-KEEPER.—No. 21.

COCHIN-CHINA OR SHANGHAI.

CINNAMON VARIETY.

In this variety (*fig. 89*) are usually found specimens taller than in the other varieties.

Fig. 89.—Cinnamon Cochin-China Hen.

The plumage of the hen is a reddish yellow colour; that of the cock is of a deep red and golden on the backle, shoulders, and lance-shaped feathers. The breast, the back, and the thighs are dark brick red. The sides, the abdomen, and the foot feathers are tau red, and the tail black, iridescent with green.

BIRMINGHAM SUMMER POULTRY SHOW.

SEPTEMBER 24TH-28TH.

The Birmingham Summer Show is over, the pens are put by. Mr. Watts is arranging his hall again, and all who attended the Show have seen the best specimens of the year. We congratulate this Society on their admirable meeting. We certainly were not prepared for such quality as we saw exhibited. We have attended many such exhibitions, but never have we found the officials more courteous than they were here. The Treasurer himself spread no trouble to make all go on pleasantly, and the exhibitors as comfortable as possible. We hope he was pleased with his entries; had there been more we cannot imagine where the pens would have been ranged, for the whole building seemed full from basement to roof; in fact some of the upstairs rooms were very hot indeed, and so were the

lower rooms at times—so much so that we almost trembled for the lives of some of the birds; but this was all seen to, and the rooms better ventilated at once. The birds were in Turner's pens, and well fed on Spratt's food, &c., and the pens were kept well cleaned out, and the birds generally most carefully attended to. One word only about the pens we must have: We do not care for the way they were arranged. We like them to run on smoothly in rows, and not up and down as here. It is not only puzzling to follow, but hardly puts all the exhibitors on a fair level, for a bird in the top pen has an immense advantage over a bird on the floor, especially as the pens in the bottom tier were very dark. We hope next year some plan will be contrived to make the hall lighter, and we hope sincerely the Show will end on the Saturday, so as to give those who wish it an opportunity of taking their birds home. Five days are too many, especially with young birds, at this season. We put forth these hints in the most friendly way, for the other arrangements were indeed very satisfactory. One plan especially we noticed as good: the numbers of all the pens were written out in order on sheets of paper at the door of the hall, and as each pen came in or went out the number was crossed off the list, and it was thus seen at once what really did come in and what went out. The Judges were Messrs. Hewitt and Felton, and Rev. G. Hodson. We were glad to see Mr. Felton judging his old friends the Cochins, and his awards seemed to give great satisfaction, as, too, did those of the other gentlemen. This is saying a good deal, for it must have been a hard matter to do so at a show like this, where the quality was so good and the numbers so great.

Dorkings had four classes. They came to the front well. In Coloured chickens Mrs. Arkwright cleared all the prizes. The first were very large, but we fancied the cock was a little open in tail. The pullets in the second-prize pen looked elderly, and had very sooty feet. In the third-prize pen the cockerel, judging by his spurs, looked a very early bird. The pullet was very dark, and had white ears. Still they were three splendid pens. The Silver-Grey class was very good. The cup was taken by a pen of chickens. We never remember such splendid colour, and this is the best pair of Silver-Greys we have seen for some time. The second were very large, but inferior to the first in colour. The third contained a beautiful cockerel. White Dorkings were very few, and, save the first-prize, not very good. The first were wonderful in colour and size for their age, being only five months old. In the £3 3s. Dorking class the first were not very large, in fact we did not think much of this class.

Cochins had five classes. Buffs came first. We were a little disappointed in them; we did not think them so good as they should have been. The best pullet was in the cup pen, and the best cockerel in the second-prize pen; both the pullets, however, were good in colour, and the cockerels also. We liked the third-prize pen immensely; the colour was beautiful, and we should have thought this cockerel might almost have been first, but he lacked fluff rather, and was poorly feathered on the legs. Pen 49 (Nash) contained a gigantic Cinnamon cockerel; and pen 50 (Walker) had a splendid pair of chickens, not very large, but grand in colour. The Partridge Cochins were very good. The cup pullet was grandly fluffed, but not very large; the cockerel very rich in colour. The second-prize pen must have run them closely for the cup; they were a grand pen all round. Third went to fair birds. Pen 69 (Tudman), very good indeed, also pen 67 (Tudman), very large, but in the dark and not properly seen. The White Cochins were very good. The cup pen was considered the best pen of Cochins in the Show; they were in exquisite condition and dazzling whiteness. There was a cup for the best pen in the Show except Brahmas, and this pen of White Cochins and a Duckwing Game hen were considered the best two pens, and the champion cup lay between them. It was eventually given to the Game hen; we almost think a pair of Cochins should have the first chance before a single Game hen; but she was a beauty, and of lovely colour. The second White chickens were also very good; the cockerel immense, the pullet very young. The third-prize pen contained a grand pullet, but the cockerel with her was very juvenile. Pen 73 (Birch), highly commended, had a capital pullet, but a leggy cockerel. Black Cochins were a good collection, in fact the best we have ever seen of this colour. Good birds won the cup; the hen nice in colour and shape; the cockerel very large, but badly leggy-feathered, and rather leggy. The second was a large pen, but the cock had grey under hackles, and was not good in legs. The third went to chickens. They were very promising, but we should have placed, most certainly, pen 89 (Darby) before them. This latter pen contained a grand hen, in fact the best we ever saw. Pen 85 (Nash), very promising and good. The £3 3s. Cochin sale class was not up to much, though the first-prize pen was good and colour nice. Pen 106 (Watts) was good, and should have got into the list, we think; pen 91 (Burnell) good in colour, but small.

Brahma (Dark) cockerels were thirty-five in number, and a generally good class. The bird which won the £10 10s. cup was

immense in size and good in shape, yet the second bird must have run him closely, and the third too almost. They were three grand birds, we first thought one the best and then the other, they were all so grand. Pen 131 (Cresswell) was a large bird, good in colour and of fine shape; he will make a splendid bird. Pen 132 (Wright) was a large cockerel, but he is not made up yet; he will, all well, develop into a huge cockerel. In Dark Brahmas pullets we thought the winners very good, but hardly up to the quality of one or two other pens, but they were in so dark a place that it is hardly fair to criticise. Pen 111 (Walker) was a grand pullet. So were pens 191 and 195 (Watts). We did not much care for the third-prize pullet; she was rather light. Light Brahmas were good. We admired the pullets much, Mrs. Williamson's most especially; but the cockerels were hardly old enough for them. There was an inclination to yellow in the cocks. The second-prize pen seemed as good as any. Pen 208 (Holmes), was most promising. Pen 198 (Williamson) will make a wonderful pen.

The £3 3s. Selling Brahma class was not so good as we expected. The winners were cheap birds, still we expected to see more bargains in this class.

Spanish we did not think much of. The second-prize went to good chickens. Pen 264 (Walker) had a good cockerel.

Game were on the whole very good. The cup cockerel was rather coarse. We liked the third Black Red cockerel very much; also pen 281 (Matthews). In Duckwing hens the cup bird was truly superb, we doubt if we ever saw her equal. Mr. Matthews may well be proud of her.

Hamburghs did not muster very strongly. We expected a larger entry from Goitstock. The cup Gold-spangles were in exquisite condition. We admired this pen immensely; their colour was good, and so was their style. In Silver-spangles the cup pen was beautiful. Second also good. In the Pencilled, first in exquisite feather, third pressing closely on the second. Pen 363 (Feast), good. In Black Hamburghs the first were good, so were the third; in fact the pullet in this pen was of most gorgeous colour, almost the best Hamburgh hen shown.

Polands were a capital lot. The winners' names show the quality. In the Dark variety the third pullet was the best in the class, but the cock with her too young.

Houdans brought nearly thirty pens. The first were good, but we liked pen 391 (Dring), or 405 (Wood), as well as any. The second looked like the Faversham stamp too. *Crievs* were good; the winners well placed.

Malays were splendid. The first were in good plumage and hard feather; but the second pressed them closely. The birds in the third prize pen were very young and good chickens.

Silks.—With these we were much pleased. The judging was good. Mr. Hodgson does carry one stamp of bird in his eye—such a relief after the execrable judging of this variety we saw at Bath. We liked the second-prize pen best; the first were a trifle coarse. The third had the best pullet in the class. Pen 436 (Darby), very good. Pen 433 (Cresswell), an admirable pullet.

In the *Variety Class* poor Sultans won first. A smart pen of Minorcas which was second we liked much better, or even a good pen of Leghorns (Fowler), which were third.

Game Bantams were not so good as we have seen at other shows of this year, though the cup pen was grand in colour. These were Piles.

Laced *Bantams* were good. We were delighted to see so many entries, and hope they will muster as well at Oxford. Mr. Leno's Silvers were of beautiful colour. Black Bantams also good; the winning pens fully up to the mark. In the *Variety Bantam* class Pekins won first. They were rather out of condition. White-booted second; the hen rather too big, but the cock of the purest colour. Third very pretty White Frizzled. We should have almost placed this pen higher in the list.

Turkeys were very large and good generally. We admired pen 522 (Fowler) as much as any, though the first-prize pen were very large and heavy-looking. In *Goslings*, two huge birds won, but they looked a trifle elderly. We should have placed Mr. Fowler's Embden gander second. Aylesbury and Rouen Ducks were good. We think the first pen was the cup Aylesbury pen. The third were also a grand pen, as, too, were the third Rouens. Of the Black East Indians we really cannot speak. They might as well have been in a coal-cellar. The pens were so dark it was impossible even to see if they were empty or full. We heard, however, the awards were placed. The *Variety Duck* class was again badly situated, but the collection was a most uncommon one, and we never remember seeing a prettier collection.

This ended the poultry section. We have criticised this department as honestly as possible, but we could not get at the birds from the crush of visitors and darkness of most of the pens to do that justice we would have wished to those pens which are not in the prize list. We fancied many birds were worthy of high commendations which were passed by without one. To some amateur exhibitors a notice of any kind is certainly a kind

of sop after having invested in an expensive entry fee. We hope Mr. Watts made the Show pay; if so we shall expect to see a pair of St. James's Hall next year, for most certainly he can pack no more than the 1350 entries of 1874 in the present building. We have made this report so lengthy we must postpone that of the Pigeons to our next number. We take this opportunity of saying how civilly on the part of the officials does answer. We heard of no one case of grumbling, and in every way all exhibitors were treated alike, no favour or partiality to personal friends being in any way shown, and we received the same courtesy from the feeders and workmen as we did from those higher in office.

DORKINGS (Coloured, except Silver-Gray).—*Chickens*.—1, Cup, 2, and 3, Mrs. Arkwright, Sutton Scarsdale.

DORKINGS (Silver-Gray).—*Chickens*.—Cup, O. E. Cresswell, Early Wood, Bagshot, 2, J. Fotheringham, Fleam, Stirling, 3, J. J. Moser, Kendal, *hc*, Dr. T. Moore, Petershead, 4, J. Hunt, Kington.

DORKINGS (Any variety).—*Chickens*.—Cup, O. E. Cresswell, 2 and 3, J. E. Pugin, Huddley.

DORKINGS (Any variety).—Cup, R. W. Richardson, Meaux Abbey, Beverley, 2, J. Hughes, Kiddleminster, 3, Mrs. E. Williams, Redly, Berwick.

COCHINS (Any variety).—*Chickens*.—Cup, W. A. Taylor, Manchester, 2, C. Sugwick, Rydesden Hall, Keighley, 3, W. A. Burnell, Southwell, Notts, *etc*, T. A. Sash, Sproughton, 4, J. Walker, Rochdale.

COCHINS (Partridge).—*Chickens*.—1, Cup, Of Sidgwick, 2, W. A. Taylor, 3, R. P. Percival, Northwich, Manchester, *hc*, Hon. Mrs. Sugden, Wells (2); E. Tadmam, Whitechurch, Salep.

COCHINS (White).—*Chickens*.—1, Cup, and 2, R. S. Woodgate, Pembury, Tunbridge Wells, 3, Mrs. A. Williamson, Leicester.

COCHINS (Black).—1 and Cup, T. Aspdon, 2, J. Walker, 3 and *hc*, Mrs. Taaffe, Foxborough, Tuck.

COCHINS (Any variety).—1, J. K. Fowler, Aylesbury, 2, C. Bloodworth, Chesham, 3, C. Sidwick, *etc*, J. Watts, Hazlewell Hall, Birmingham, *hc*, G. Pettifer, Hark, *etc*.

BRAHMAS (Dark).—*Cockerels*.—1, Horace Lingwood, Cresting, Needham Market, 2 and 3, T. F. Aspell, Cowley Mount, Needham Market, *hc*, O. E. Cresswell, 4, Wright, Crutch End, London; Horace Lingwood, *c*, Hon. Mrs. A. B. Hamilton, Woburn.

BRAHMAS (Dark).—*Pullets*.—Cup and 2, Horace Lingwood, 3, R. P. Percival, *etc*, R. B. Wood, *hc*, J. Walker, T. Lewis, Wolverhampton; E. Ryder, Newton Bank, Byde; Hon. Mrs. A. B. Hamilton, J. Bennett, G. W. Palmer, Shifnal, W. E. Leches, W. Leches, Salop; J. Watts (2), *c*, J. Beck, Lifford.

BRAHMAS (Light).—*Chickens*.—1, Horace Lingwood, 2, R. E. Hosald, Grassendale Priory, Liverpool, 3, Mrs. A. Williamson, *etc*, Mrs. A. Williamson, Horace Lingwood, *hc*, Rev. G. Watson, Lymington, J. T. Holmes, E. B. H. Harris, Bridgend, Penryn, 4, J. H. Butler, Erdington, *c*, T. A. Dean, Marden, Hereford, 2, P. Barnes, Fairgate, Diss; J. Mitchell, Moseley, Birmingham.

BRAHMAS (Any variety).—1, T. P. Andell, 2, W. B. Etches, 3, E. Kendrick, jun., Lichfield, *hc*, Hon. Mrs. A. B. Hamilton, E. Sharratt, *c*, E. Pritchard, Tettenhall, Wolverhampton, J. Watts.

SPANISH.—*Chickens*.—1, E. Wraywood, Worcester, 2, G. K. Chilcott, Cotham, 3, J. Pitt, Wolverhampton, *hc*, J. Walker.

GAME (Black-brasted or Brown Red).—*Cockerels*.—1 and Cup, T. Dyson, Bahliax, 2, G. H. 1, *ey*, Newark, 3, S. Field, Bicester, *hc*, W. Ferrin, Nantwich, S. Matthew, Stowmarket, G. Bagnall, Draycott.

GAME (Black-brasted or Brown Red).—*Pullets*.—1, G. Bentley, Rickmansworth, 2, T. Dyson, 3, S. Matthews, *hc*, B. Mollit, Balham; S. Field (2); Lunt and Hassall, Market Drayton; J. Foreyth, Wolverhampton (2), *c*, G. W. Ward, Kington, *c*, T. Whitaker, Nettleton, Snowhay; E. Bell, J. Cock, H. E. Martin, Sculphorpe; G. H. Fitzherbert.

GAME (Duckwing, or any other variety).—*Cockerels*.—1, G. H. Fitzherbert, 2, S. Matthews, 3, W. Gough, Early, Skipton, *hc*, H. P. Price, Castle Madox, Brecon, *c*, E. Aykroyd, Eccleshill.

GAME (Duckwing, or any other variety).—*Pullets*.—1 and Cup for best pen in Show, S. Matthews, 2, Wilson & Hodgson, Ilkington, 3, D. W. J. Thomas, Brecon, *hc*, J. A. & H. H. Daveley, Driffield; T. Whitaker; G. H. Fitzherbert; Lunt & Hassall, *c*, T. Whitaker, Nettleton, Snowhay; E. Bell, J. Cock.

HANDICAPED (Gold-spangled).—1 and Cup, J. Long, Loomley, Kent, 2, T. May, Wolverhampton, 3, H. Beldon, Gont-cup, Pingley, *hc*, I. Davies, *c*, G. and J. Duckworth.

HAMBURG (Silver-spangled).—1, H. Beldon, 2, J. Long, 3, W. McMellon, West Glossop.

HAMBURG (Gold and Silver pencilled).—1, H. Beldon, 2, G. & J. Duckworth, Church, 3, J. Long, *hc*, H. Feast, Swansea (2).

HAMBURG (Gold and Silver).—1 and Cup, H. Beldon, 2, J. Long, 3, W. Birch, Barnacle, Coventry, *hc*, C. Sidwick, *c*, E. Leake, Brimfield, Salop.

FOLANDS (Gold and Silver-spangled).—1 and 3, G. C. Atkins, Lightwolds, Birmingham, 2, T. Dean, *hc*, J. E. Earmley, Lowton, Newton-le-Willows; W. A. Taylor, P. Unsworth, Lowton, Newton-le-Willows.

FOLANDS (Black, or any other variety).—1 and 2, P. Unsworth, 3, A. Darby, Shrewsbury.

HUTCHINS.—*Chickens*.—1, Miss C. G. Neville, 2, Mrs. Vallance, 3, Miss Woodhead, Leiston, *hc*, W. Dunn, Faversham; R. B. Wood, Uttoxeter; G. Berry, Little Heathon, *c*, W. H. Coppleson (2).

CREVELLERS OR ANY OTHER FINEST VARIETY. —1, R. B. Wood, 2 and 3, Rev. C. C. Ewbank, Biggleswade, *hc*, W. Dring.

MALAYS.—1 and *hc*, J. Hinton, Warminster, 2, Rev. A. G. Brooke, Shrawardine, 3, R. Hawkins, Seaham.

SILKYS.—*Chickens*.—1, S. P. Broad, Reigate, 2, Mrs. J. T. Holmes, 3, R. S. S. Woodgate.

ANY OTHER VARIETY EXCEPT BANTAMS.—*Chickens*.—1, H. Feast, 2, J. Croote, jun., Wellington, *hc*, Thurnham Bros., Piccadilly End, Hemel Hempstead; J. Long, *c*, J. Watts.

GAME BANTAMS (Black or Brown Red).—*Cock or Hen*.—1, R. Brownlie, Kirkcaldy, 2, T. Barker, Burnley, 3, F. Shumack, Southwell.

GAME BANTAMS (Duckwing, or any other variety).—1 and 3, R. Brownlie, 2, F. Matland, Worcester.

BANTAMS (Gold or Silver-faced).—1 and 2, M. Leno, Markyate Street, 3, A. Robertson, Kilninch, *hc*, J. Walker, *hc*, J. Walker, Brimingham, *c*, C. H. Poole, Bridgewater, Somerset; F. Brand, Mrs. Mayo, Gloucester.

BANTAMS (Black Roscomb).—1, Milner & Lealand, Keighley, 2, H. Beldon, 3, R. F. Parrott, Hensbury, *hc*, F. Ashton, Mottram, *c*, H. Feast.

BANTAMS (Any other variety).—1, J. Walker, 2, E. S. S. Woodgate, 3, A. A. Vander Meersch, Lower Tooting, *hc*, T. Cropper, Bacup; J. Watts.

BANTAMS (Any variety).—1, M. Leno, 2, J. Ossett, Heston, 3, H. Yardley, Birmingham, *c*, J. Watts; G. F. Ward.

POULTRY.—1, E. Kendrick, jun., Newbury, 2 and 3, F. Lythall, Offchurch, Leamington; *hc*, J. Walker, *hc*, Rev. N. J. Killey, J. K. Fowler.

GUSLINGS.—1 and 2, J. Walker, 3, S. H. Stott, Preston, *hc*, F. E. Rawson, Thorpe, Halifax, *c*, J. K. Fowler.

DUCKS (White Aylesbury).—1 and 2, J. K. Fowler, 3, J. Walker.

DUCKS (Rouge).—1, W. Manley, Handsworth, 2, T. Wakefield, Golborne, Newton-le-Willows, 3, J. Walker, *hc*, H. Dowsett, Mesley, Chelmsford; J. H. Hewitt, St. Austell; P. Unsworth.

DUCKS (Black East of India).—1 and 2, G. S. Sainsbury, 3, Rev. J. Richardson, Sandy Beach, *hc*, J. V. Kellaway, Merston, Isle of Wight; G. S. Sainsbury.

DUCKS (Any other variety of Fancy Waterfowl).—1 and Cup, H. B. Smith, Broughton, 2 and 3, M. Leno, *hc*, J. Walker; E. A. Bailey, Tenbury;

Dr. W. Binns, Tudey (2); H. B. Smith; H. S. Edmunds, Handsworth; Mrs. Arkwright, *c*, Mrs. J. Southall, Handsworth; Mrs. Arkwright.

SELLING CLASS.—1, E. Kendrick, jun., 2, J. K. Fowler, 3, J. Watts, *hc*, J. Hughes.

PIGEONS.

CARRIERS (Black).—*Cock*.—Cup and 1, H. Yardley, Birmingham, 2 and 3, W. Siddons, *sen*, *hc*, G. F. Whitehouse, King's Heath, Birmingham; W. Siddons, *sen*, *hc*, W. G. Hammock, 2, W. Palmer, Spelling, 3, Major J. H. Cryer, Southport.

CARRIERS (Dunk).—*Cock*.—1 and *hc*, H. Yardley, 2, W. G. Hammock, Florid, 2, G. F. Whitehouse, *sen*, *hc*, H. Yardley, 2, W. G. Hammock, 3, W. Siddons, *sen*, *hc*, Major J. H. Cryer.

CARRIERS (Any other colour).—*Cock*.—1, J. F. White, Birmingham, 2, E. C. Stretch, Oldsark, 3, W. Massey, Spauling, *hc*, R. Cant, *sen*, *hc*, E. C. Stretch, 2, W. G. Hammock, 3, J. C. Ord, Farnley.

CARRIERS.—*Young*.—*Cock or Hen*.—1, W. Dunmer, 2, W. G. Hammock, 3, W. Siddons, *sen*, *hc*, R. Cant, Broughton (2); H. H. Massey.

POULTRY.—*Cock*.—1, E. Beckwith, Underland, 2, 3, and 4, H. Pratt, Hampton-in-Arden, *hc*, J. Richmond, Oswaldtwistle, *sen*, *hc*, J. Baker, Kew Bridge, 2, 3, and *hc*, H. Pratt.

BABES.—*Cock*.—1 and 2, J. Firth, Dowsbury, 3, F. Smith, Selby Oak, Birmingham, *hc*, J. Dowling, Blackrock, Cork, *sen*, Medal, J. Firth, *Young*.—*Cock or Hen*.—1 and *hc*, J. Firth, 2 and 3, F. Smith.

TUMBLERS (Short-faced).—*Almonds*.—*Cock or Hen*.—1, H. Yardley, 2, W. G. Hammock, 3 and *hc*, J. Ford, Monkwell Street, London.

TUMBLERS (Short-faced).—1 and 2, 3, *hc*, and *c*, W. Woodhouse, King's Lynn.

TUMBLERS (Short-faced, any other colour).—*Cock or Hen*.—1, R. Minnitt, jun., Rochdale, 2, H. Yardley, 3, J. Ford, *hc*, E. Beckwith; E. Horner, Harewood, Leeds, *c*, H. Verdon, Waverley; E. D. Careless, Aston.

TUMBLERS (Long-faced, Flying, Rosewing, Kid-basted, or Mottled Muff-legged).—*Cock or Hen*.—1, W. B. Mapplebeck, jun., 3 and *c*, J. Watts, 3, P. D. Carless, *hc*, E. W. Careless; W. B. Mapplebeck, jun., Moseley, Birmingham.

TUMBLERS (Long-faced, Flying, Saddle or Badge, or any other variety of Muff-legged).—*Cock or Hen*.—1, cup, 2, and 3, W. B. Mapplebeck, jun., *hc*, R. G. Tebbay (2), *c*, W. B. Mapplebeck, jun.; R. G. Tebbay, Grimsby.

TUMBLERS (Long-faced, Flying, Clear-legged, any colour).—*Cock or Hen*.—1 and 2, J. Ford, 3, D. Ridgough, jun., Bradford, *hc*, D. Ridgough, jun.; J. Watts, *hc*, W. F. Edge, Birmingham.

FANTAILS (White).—*Cock or Hen*.—1 and 3, Q. Blumh, Higher Broughton, Manchester, 2, A. Smith, *hc*, Q. Blumh; H. C. Bowman, Higher Broughton; J. F. Loversidge, Newark; Rev. W. Serjeantson, Acton Burnell; J. Richmond.

FANTAILS (Any other colour).—*Cock or Hen*.—1, Q. Blumh, 2, Major J. H. Cryer, 3, H. C. Bowman.

JACOUBINS (Red or Yellow).—*Cock or Hen*.—1 and 3, J. Baker, 2, H. W. Webb, Lower Sydenham, *hc*, L. Allen, London Road, Southwark; W. Croft; T. Holmes, Sydenham.

JACOUBINS (Any other colour).—*Cock or Hen*.—Cup, J. Baker, 2 and *hc*, A. A. Vander Meersch, 3, W. Croft.

TERBITS (Red or Yellow).—*Cock or Hen*.—Cup, A. A. Vander Meersch, 2, O. E. Cresswell, 3, W. Croft, *hc*, C. A. Crafer, Wallington; W. J. Rumley, Ballinacarra; W. Croft; J. Baker, *c*, A. Riddell.

TURKISH (Any other colour).—*Cock or Hen*.—Cup, E. T. Dew, Weston-super-Mare, 2, G. H. Gregory, Taunton, 3, J. Baker, *hc*, P. H. Jones, Fulham (2); J. Nield, Birmingham; O. E. Cresswell (2); J. Baker.

OWLS (English).—*Cock or Hen*.—Cup, J. W. Edge, 2, G. Henry, 5, Ward and Rhodes, Otley, *hc*, E. W. Van Sanden, Shepherds Bush; H. Verdon; A. J. Barnes, G. Guesier; G. Henry, Sandymount; T. W. Clementson, Hexham; H. H. Jones; Dr. W. Binns (2); J. Nield.

OWLS (Foreign).—*Cock or Hen*.—1, L. Allen, 2, P. H. Jones.

SCOTTISH.—*Cock or Hen*.—Cup, J. Lederer, Boodle, 2 and 3, A. A. Vander Meersch, *hc*, H. Yardley.

DRAGOONS (Blue).—*Cock or Hen*.—1, Ward & Rhodes, 2, H. Yardley, 3, W. Smith, *hc*, W. H. Mitchell, *hc*, W. Gamon, Chester; W. Bishop, Dorchester; J. Watts, *c*, L. Whitehead, Drury Lane, London; H. Yardley.

DRAGOONS (Red or Yellow).—*Cock or Hen*.—1, L. Whitehead, 2, F. Graham, Birkenhead, 3, J. Ashworth, *hc*, W. H. Mitchell (2).

DRAGOONS (Any other colour).—*Cock or Hen*.—1, W. Smith, 2, H. Yardley, 3, J. Downing, *hc*, C. F. Staunton, L. Whitehead, *c*, F. Graham; D. Young, Leamington.

DRAGOONS.—*Young*.—*Cock or Hen*.—1 and 2, F. Graham, 3, T. Charnley, Blackburn, *hc*, J. G. Dunn, Durlham, 4, F. Graham, 2, Young; J. Downing, W. Bishop, *c*, R. Woods, Mansfield; J. Ashworth, E. Horner.

ANTWERPS (Short-faced, Blue or Silver).—*Cock or Hen*.—1, 2, and *hc*, W. Gamon, 3, J. F. White, *hc*, J. Gardner, Preston, *c*, J. W. Ludlow, Birmingham.

ANTWERPS (Short-faced, any other colour).—*Cock or Hen*.—Cup, 3, and *c*, W. Gamon, 2, J. W. Ludlow, *hc*, H. Yardley (2).

ANTWERPS (Short-faced).—*Young*.—*Cock or Hen*.—1, H. Gough, Wolverhampton, 2, E. Thompson, Selby Oak, Birmingham, 3, S. Foster, Birmingham, *hc*, J. Deakin, Sheffield; J. Forrest, Birmingham; C. F. Copman, Solihull; A. J. Barnes.

ANTWERPS (Homing, Long-faced).—*Cock or Hen*.—1, J. Lister, Keighley, 2, E. L. Keys, 3, W. K. Pratt, *hc*, J. W. Barker, Reading; J. Nield, *c*, J. W. Barker.

SWALLS.—*Cock or Hen*.—Cup, E. Horner, 2, H. Draycott, 3, J. Gardner, *hc*, F. Braund, Biddford; J. Gardner, *c*, E. Duckworth, Waverley, Liverpool.

MAGPIES.—*Cock or Hen*.—Cup, D. Young, 2, E. Horner, 3, P. H. Jones, *hc*, C. G. Hitchcock, Oxford (2); M. Ord; H. Yardley; W. G. Davies, Swansea; J. Watts.

ARCHANGELS.—*Cock or Hen*.—1, P. H. Jones, 2, R. Wilkinson, Gaidford, 3, J. W. Ludlow, *hc*, W. J. Rumley, H. Yardley; W. H. Dawson, H. W. Webb, *Any other VARIETY*.—*Cock or Hen*.—Cup, J. W. Ludlow, 2, J. H. Inchley, Leamington, 3, H. Yardley, *hc*, M. Ord (Fribback); H. W. Webb; Malle, M. Vander Meersch; J. Watts; F. H. Paget.

SELLING CLASS.—*Cock or Hen*.—Cup, J. Baker, 2, E. Beckwith, 3, W. H. A. Miller, Walsall, 4, H. B. Massey, *hc*, J. Ford (2), *hc*, H. Yardley; J. Nield; F. H. Paget, *c*, H. Yardley, 4, J. Richmond; J. Ford; J. W. Ludlow.

SELLING CLASS.—*Pair*.—1, J. Ford, 2, W. H. A. Miller, 3, F. Braund, 4, T. Chambers, jun., *hc*, E. Beckwith, *hc*, D. Causar, Erdington, Birmingham; F. Braund; H. Yardley; W. D. Richardson, Welles; J. Watts, *c*, S. Howe, Erdington, Birmingham; Rev. A. G. Brooke (Fire Pigeons); J. F. Loversidge.

SELLING CLASS.—*Pair or single Birds*.—1 and *hc*, J. Ford, 2, G. F. Whitehouse (Black Carriers), 3, H. Yardley, 4, J. Baker, *hc*, E. Beckwith, *c*, W. Croft (Black Jack).

JUDGES.—*Poultry*.—Mr. E. Hewitt, Rev. G. F. Hodson, and Mr. C. Felton. *Pigeons*.—Mr. F. Esquilant, Mr. H. Allsop; and Mr. G. Gorden for Flying Tumblers.

SOUTH STOCKTON ORNITHOLOGICAL SHOW.—From a schedule before us we note that an Exhibition of Cage Birds, open to all England, will take place at South Stockton on the 16th and 17th of October, when prizes of 10s., 5s., and 2s. 6d., will be awarded to each of the following breeds of Cage Birds: Belgians, Norwich, Cinnamon, Lizards, Yorkshire, Clear Green,

any other variety, cages of sixes, Males, Goldfinches, Brown Linnets, &c. A silver medal, value £1, will be awarded to the exhibitor obtaining the greatest number of points. The entries are announced to close October 10th, and it is stated that the surplus of the proceeds will be given to the Cottage Hospital, a praiseworthy act indeed, and which deserves all support.

ELLESMERE POULTRY SHOW.

THE arrangements for this Show (held on September 25th), do not admit of improvement, and the weather proving all that could be desired, the greatest amount of success resulted. In fact, this has been by far the best Show yet held in the district.

All the *Gama* chickens were unexceptionably good, perhaps never exceeded at any show; but strange to say, the class for single Game cocks proved the worst in the Show, the two prizes only being awarded, and even those with difficulty. In spite of so many as five principal shows being held simultaneously, the *Cochins*, whether Buff or Partridge-feathered, were such as can be but rarely met with at any exhibition; in both of these varieties the winners were of marvellously good quality, and in this instance the majority of the highly-commended pens would have readily secured prizes at most shows. The *Spanish* class would have been a credit to even a Bristol meeting, the first prize going to that district. *Hamburghs* were far better than common in this neighbourhood; and the *Grey Dorkings* were few but very perfect. In *Turkeys*, *Geese*, and *Ducks* the known popularity of this district was fully maintained; in fact, it would be hard to meet with better ones.

In *Bantams* the Black were the best of any. A very large Selling class contained some first-rate bargains, which were quickly claimed by ready purchasers.

(From a Correspondent.)

THE Meeting of the Oswestry District Agricultural Society was held this year at Ellesmere. The poultry were penned under a good tent, and the arrangements seemed very satisfactory. Mr. H-witt judged. The birds were all of this year and quite up to the average; in fact, considering there were four more shows being held elsewhere, we were much surprised to find such good specimens. The day was lovely—quite August weather, consequently the birds seemed to feel the heat, though the tent was nicely ventilated and care taken of the birds. Only one thing, however, we must mention: we saw no chaff or grit at the bottom of the pens—nothing but the bare boards, which so soon become soiled, and then spoil the appearance of the birds and the look of the pens generally.

The catalogue commenced with Black Red *Gama*. A beautiful cockerel was in the first-prize pen. They were only entered at 30s. and were quickly claimed, and a bargain they were. The second were good, but not of the quality of the first. Two good pens were highly commended. In Brown-breasted only two good pens appeared; they were both in good feather and of nice colour. In the next class a nice Duckwing won—in fact all the *Gama* were good. *Dorkings* only mustered two pens, both poor, and not equal to what we generally see at this Society's shows. *Cochins* were very good indeed; they would be a credit to any exhibitor, but they were most stupidly classed—Buffs and Whites in one class, Partridges in the other. We hope next year the Society will give classes for each of the three colours. We feel sure they would all be well supported. In the first class Buffs won both prizes; they looked very much like Capt. Heaton's stamp. The pullets were both beautiful, the colour being so good. The first cockerel was a large bird; the second cockerel not so large, but grand in colour. Mr. Sidgwick's highly-commended pen was nice; the same pen we think we saw at Aylesbury. A very good pair of Whites (Woodgate) were also highly commended; the cockerel very undeveloped, but well feathered and white; the pullet young and promising. In Partridges both the prize cockerels were good in size, shape, and colour; the pullets looked rather dull and elderly, but were good in pencilling. *Spanish* were a small and good class. The first were nice forward chickens; pen 29, highly commended (James), very promising. Dark and Light *Brahmas* were both good classes. We thought the best pullet was certainly in the first-prize pen, while the best cockerel was in the second, but the latter's comb was not good. Several good pens were highly commended, especially those of Messrs. Dean and Etches. Lights were admirable; we fancy, however, there is a tendency to bad combs in the Light cockerels. The first-prize one had this failing, and he was rather yellow, but he was good in style and shape. *Hamburghs* came well to the front, all varieties being good. In the Pencilled the first went to good Silvers, very young, but good in all points; second nice Golds; pen 57 (Carr) was also very good. In *Spangies* Silvers won again—a capital pen, and the highly-commended pens were also good birds. *French* had two classes, *Creves* and *Houdans*. There were only two pens of the former; both had well-grown chickens, and of a good black colour. The first *Houdans* were very fine; this pen contained the best cockerel we have seen this season;

his condition was perfect. Second also good, but not looking in such good feather as the first. Several good pens were highly commended. Of *Game Bantams* there were but two entries, and the birds only fair. In the next Bantam class young but good Blacks won first, and fair Gold-faced second. Two more good pens of Blacks were noticed.

Turkeys were a capital—quite a noble-looking collection, and so were the *Geese*, two wonderfully good young pens of goslings winning. *Aylesbury* and *Rouen Ducks* were also good. The former were not up to the Fowler standard, still they were well-grown ducklings. In the Variety Duck class good-coloured but very large Black East Indians won; second and highly commended, *Fancy Waterfowl*; highly commended (Kendrick), large East Indians.

The *Sale* classes were not up to much. Each pen had to contain three birds, and the price being limited to 30s. per pen, we can easily account for the poor quality. The first prize went to nice Black-breasted chickens, second to Ducks.

The local department was a great success. *Turkeys* were first and *Geese* second, both lots being good, useful, farmyard birds, and these are the kind of birds such classes are made to encourage.

Some extra *Game* classes of 1874 birds finished up the Show, which from its good management and full attendance must, we think, have been a great success. We give awards below.

GAZE.—Black-breasted Red.—1, G. Cottle, Westleton, Salop. 2, Mrs. Wilkinson, Green Hays, Manchester. *hc*, P. A. Beck, Galsfield, Welshpool; W. C. Phillips, Worcester. *Brown-breasted Red*.—1, T. Dyson, Halifax. 2, Rev. P. G. Bentley, Westleton. *Duckwing Greys and Whites or Piles*.—1, J. Mason, Worcester. 2, W. C. Phillips.

DORKINGS.—1, E. Shaw, Plaswilmot, Oswestry. 2, Mrs. Somerville, Chirk, North Wales.

COCHINS.—*Brown or Partridge*.—1 and 2, E. Tufman, Ashgrove, Whitclough, *hc*, C. Sidgwick, Kendley. *White or Buff*.—1, W. H. Crabtree, Levenshulme, Manchester. 2, W. Whitworth, jun., Longgait, Manchester. *hc*, C. Sidgwick; K. S. S. Woodgate, Pembury, Tambridge Wells. *c*, Mrs. E. Wilkinson.

SPANISH.—1, J. Giddon, Bristol. 2, H. Wilkinson, Earby, Skipton. *hc*, Mrs. Tonlon, Bristol; E. Winwood, Worcester; F. James, Peckham Rye.

BRAHMA.—*Pootras*.—*Dark*.—1, J. H. Pickles, Etrichale, Southampton. 2, W. H. Crabtree. *hc*, W. B. Etches, Whitechurch; E. Wilkinson; T. A. Dean, Marton, Hereford. *c*, W. B. Etches; Bridgewater & Yoxall, Welnesbury. *Light*.—1, H. Boulton, Llandysul Rectory, Montgomery. 2, T. A. Dean. *hc*, C. Morris, Chester (2). *c*, Miss S. Cotes.

HAMBURGH.—*Silver or Gold pencilled*.—1, J. Long, Bromley Common. 2, Mrs. G. M. Rolis. *hc*, G. Kirby, Ludlow, Salop; F. B. Lowe, Whitechurch; J. Carr, Swansea; J. Robinson, Garstang; Mrs. G. M. Rolis. *c*, T. G. Jones, Llansaintfrid. *Silver or Gold-spangled*.—1, J. Robinson. 2, T. Blakeman, Tevenhall. *hc*, J. Long; J. Carr; Mrs. G. M. Rolis.

GREY.—*Geese*.—1, R. B. Wood, Uttoxeter. 2, G. W. Hibbert, Godley, Hyde. *BANTAMS*.—1, G. W. E. Wood. 2, R. B. Wood. *hc*, R. B. Wood; C. Morris (2).

c, E. Williams, Henllys Berriew, J. Robinson.

GAME BANTAMS.—1, J. Long. 2, J. Cowburn, Maesgarneid, Corwen.

BANTAMS.—1, R. H. Ashton, Mottram. 2, H. Yardley, Birmingham. *hc*, R. H. Ashton; T. Dyson.

TURKEYS.—*Young*.—1, G. Robinson, Llandrinio. 2, E. Kendrick, jun., Lichfield. *hc*, N. J. Ridley, Newbury; W. B. Etches; Mrs. Somerville. *c*, J. Cowburn.

ELDERLY.—1, T. Mills, Scacombe. 2, W. B. Etches. *hc*, P. Cook, New Marton, Ellsworth; E. Shaw.

DUCKINGS.—*Aylesbury*.—1, Rev. G. R. Bailey, Madeley, Newcastle. 2, E. Shaw. *hc*, W. H. Crewe, Derby (2). *Rouen*.—1, W. B. Etches. 2, E. Kendrick, jun. *hc*, E. Shaw.

DUCKS.—*Any other variety*.—*Any age*.—1, E. Shaw. 2, H. Yardley. *hc*, E. Kendrick, jun.; Mrs. G. M. Rolis.

SELLING CLASS.—*Any age*.—1, E. Smith, North, Oswestry (Black-breasted Red); 2, E. Shaw (Ducks). *hc*, G. Roberts, Woodhill, Oswestry (Game); J. Wainwright, Galsfield, Welshpool (Black-breasted Game) (2); H. Wilkinson; E. Smith (Black-breasted Red); E. Shaw. *c*, Mrs. H. Floukes, Montgomery (Light Brahmas); T. Groves, Shrewsbury (Cochins); F. Edwards, Penybont, Chirk (Silies).

LOCAL CLASSES.

TURKEYS, GEESSE, DUCKS, OR FOWLS.—1, P. O. Gull, Trewern (Turkeys). 2, Mrs. C. E. Blackwell, Rayton-at-Towans (Geese). *hc*, Mrs. Somerville (Turkeys); E. Shaw (Turkeys).

GAME.—*Black-breasted*.—*Chickens*.—1, P. A. Beck. 2, J. Wainwright. *hc*, C. H. Bull, Caeglas, Oswestry. *Any colour*.—*Pullets*.—1, P. A. Beck. 2, C. H. Bull. *hc*, E. Shaw; T. Edwards, Chirk, Raibon. *c*, Rev. P. G. Bentley. *Cock*.—1, E. Shaw. 2, P. A. Beck.

DORKINGS.—*Chickens*.—1, Mrs. Somerville. 2, E. Shaw.

JUNCOE.—Mr. E. Hawitt, Elen Cottage, Sparkbrook, Birmingham.

AYLESBURY POULTRY SHOW.

As might be fairly anticipated, *Aylesbury Ducks* were the leading feature of this Show, and we are happy to say no one ever saw a better collection, Mr. Fowler as usual being at the head of the poll. The young drake in the first-prize pen is certainly the best that we can call to remembrance. *Rouens* were equally praiseworthy. *Brahmas* and *Cochins* were shown of the finest possible quality, though the first-prize Dark *Brahma* chickens were scarcely so matured as could be desired. The *Game* fowls were grand classes, Mr. Matthews being triumphant with capital birds. *Hamburghs* were better than customary at shows held so far south. The class for *Fancy Ducks* was most praiseworthy, and the birds were all shown in the greatest perfection of feather. The first prize in the variety Ducks was awarded to very exquisitely-feathered *Vidua* Ducks, the second prize to a pair of remarkably fine *Cayuga* Ducks, the third being allotted to *Bahamas*. As many of our readers may feel interested in the extraordinary weights attained by *Aylesbury Ducks*, we subjoin those of the three winning pens, 19 lbs.; 17 lbs. 11 ozs.; and 17 lbs. 4 ozs. This

was the actual nett weight per couple, and by young ones like the first-prize pen we believe has never been surpassed, nor even equalled. Amongst the most interesting and unique exhibits at the Aylesbury Show was a pair of Amherst Pheasants, the property of Baron A. de Rothschild, shown as extra stock; they were in the most perfect and lovely feather imaginable, and were the most noteworthy pen in the Show. They were, as no prizes were scheduled for extra stock, only very highly commended. Being sent in such faultless condition, it is hoped these rare birds received no injury to their plumage by their visit to the Aylesbury Exhibition. It is almost needless to say the attention of the Managers, and the arrangements generally, were all that anyone could wish for, and we are informed that the whole meeting was highly successful.

DORRINGS.—1, T. C. Burnell, Micheldever. 2, Mrs. A. Tindal. 3, O. E. Cresswell, Early Wood, Bagshot. *hc.* R. Trevellick, Tring; Mrs. E. Williams, Icknield, Burrow.

BRAHMAS.—1, Lady Gwydyr, Stoke Park, Ipswich. 2, W. J. Jervis, Pinner. 3, H. Feast, Swansea. *hc.* S. W. Hallam, Whitwick, Leicester. *c.* J. K. Fowler, Aylesbury; W. Seward, jun.; M. Leno, Markyate Street.

SPANISH.—1, W. Nottage, Northampton. 2, E. Vinwood, Worcester. 3, F. James, Peckham Rye. *c.* H. Feast.

COCHINS.—1, Land Cup, Lady Gwydyr. 2, J. Walker. 3, W. A. Taylor, Manchester. *hc.* Mr. A. Tindal, Aylesbury (2). *c.* C. Sidgwick, Rydblesden Hall, Knebly; C. Bloodworth, Bays Hill, Cheltenham. *Partridge.*—1, W. A. Taylor. 2, C. Sidgwick. 3, ant. *c.* J. K. Fowler. *White.*—1, 2, and 3, R. S. S. Woodgate, Pembury, Tunbridge Wells. *hc.* C. Bloodworth; J. Funge, Long Marston. *c.* F. Belford; A. F. Faulkner, Thrapstone.

GAME.—1 and Cup, S. Matthews, Stowmarket. 2, J. Cock, Worcester. 3, Mrs. A. Tindal. *hc.* G. Bentley, Rickmansworth (2); G. Bagnall, Draycott, Stoke-on-Trent; Mrs. A. Tindal.

PHEASANT.—1, J. J. Madden, Biggleswade. 2, Rev. N. J. Ridley, Hollington House, Newbury. 3, H. Feast. *hc.* G. W. Hibbert, Godley, Hyde; J. K. Fowler; Mrs. A. Tindal; W. Dring, Faversham.

HAMBURG.—*Gold or Silver-pencilled.*—1, T. & W. Fawcett, Baildon. 2, H. Feast. 3, S. W. Hallam. *hc.* J. Walker, Rochdale; O. E. Cresswell. *Gold or Silver-spangled.*—1 and Cup, T. & W. Fawcett. 2, J. Long, Bromley, Kent. 3, S. W. Hallam.

BANTAMS.—*Game.*—1, Wingfield & Andrews, Sidbury, Worcester. 2, T. Bradbury, Buckingham. 3, J. Long. *hc.* W. Adams, St. Clements, Ipswich; M. Leno, Wingfield & Andrews; H. Gurney, jun., Aylesbury. *Any other variety.*—1, J. Walker. 2 and 3, M. Leno. *hc.* R. S. S. Woodgate; J. K. Fowler; M. Leno; J. Mayo, Gloucester. *c.* H. Feast.

DUCKS.—*Aylesbury.*—1, 2, and 3, J. K. Fowler. 3 and *hc.* J. C. Hedges, Aylesbury. *c.* T. Kingsley, Boarscroft, Tring. *Rouen.*—1, 2, and 3, W. Evans, Prescott. *hc.* J. Walker; J. Newton, Siladen, Leeds. *c.* R. Gladstone, jun., Broad Green, Liverpool. *Any other variety.*—1 and 3, M. Leno. 2, J. K. Fowler, *hc.* J. Walker; M. Leno.

AMERICAN FOWLS.—*White Leghorns, Brown Leghorns, and Plymouth Rocks.*—1 and *c.* J. K. Fowler. 2, A. Kitchen, Dunsdale, Westham. 3, J. Long.

DUCKS.—*Aylesbury.*—1, W. Soton, Aylesbury. *hc.* Mrs. M. Watson, Tring; R. Trevellick, Tring. *c.* F. Payne, jun., Aylesbury; G. Rodwell, Aylesbury.

ANY OTHER DISTINCT VARIETY.—1, J. Long. 2, J. K. Fowler (Leeds). 3, R. S. S. Woodgate (White Silvers). *hc.* J. Walker; A. Darby, Little Ness, Shrewsbury; Rev. N. J. Ridley, Malsay; W. A. Taylor (2). *c.* H. Feast.

SILVER CLASS.—1, F. Belford, Great Berkhampstead, White Cochins. 2, J. K. Fowler. 3, C. Bloodworth (Silver Polands). *hc.* T. Kingsley (Ducks). *c.* R. Harver, Chaddington, Euston.

EXTRA STOCK.—*vic.* Sir A. de Rothschild (Pheasants).

JUDGE.—Mr. E. Hewitt, Eden Cottage, Sparkbrook, Birmingham.

DERBY POULTRY AND PIGEON SHOW.

THE above Show was held in two spacious marquees in the grounds adjoining the Derby Cattle Market on Wednesday the 23rd of September. On the whole the Show was a most successful affair, vast numbers of people visiting it. The principal attractions were the *Geese*, *Ducks*, and *Turkeys*; the *Brahmas* and *Dorkings* also being good.

THE PIGEONS were few in number; the *Fantails* being the best.

THE Judges were the Rev. T. O. Grady and Mr. J. R. Dobbin. The following are the awards:—

DORRINGS.—*Coloured.*—1 and 2, Mrs. Arkwright, Sutton Scarsdale. *hc.* C. R. Colville, Lullington. *White.*—1, Mrs. A. Eley, Hill Top. 2, S. T. Vernon, Kirk Langley.

SPANISH.—1 and *c.* W. Storer, Mickelover. 2 and *hc.* G. A. Crew, Etwell.

GAME.—*Dark-breasted.*—1, Earl Londoun. 2, C. Jordan, Thulston. *hc.* Earl Londoun; W. Hollingworth, Dale Abbey; G. Cowlishaw, Derby; J. A. Wheatcroft. *c.* Earl Londoun. *White or Pale.*—1 and 2, G. Cowlishaw.

HAMBURG.—*Gold-pencilled.*—1 and *hc.* W. Jackson, Alton. 2, J. Langley. *Gold-spangled.*—1, Withwell. 2, C. Pickering, Kirk Langley.

SILVER-PENCILLED.—1, F. W. Meynell. 2 and *hc.* G. Brough, Bradford. *Silver-spangled.*—1 and *hc.* C. Packer ng. 2, H. Hingley, Ralborne.

COCHIN-CHINAS.—1, Rev. R. Fielden, Mugginton; Rev. R. Storr, Lockington. 2, Rev. R. Fielden. *hc.* F. Holbrook, Derby.

BRAHMAS.—*Light.*—1, W. Thorn, Stanton-by-Bridge. 2, F. Holbrook. *Dark.*—1 and 2, Mrs. Arkwright. *hc.* F. Holbrook; Rev. R. Storr; G. A. Crew.

CROSSBRED OR ANY OTHER DISTINCT VARIETY.—1, A. F. Hart, Ravenstone. 2, S. T. Vernon. *hc.* and *c.* Rev. R. Fielden.

DUCKS.—*Rouen.*—1, S. Robson, Melbourne. 2, R. Johnson, Kirk Ireton. *hc.* G. Meynell. *Aylesbury.*—1 and 2, G. A. Crew. *hc.* J. Wood. *c.* W. Hollingworth.

GESE.—1 and 2, C. R. Colville.

TURKEYS.—1, J. Matthews, Repton. 2, W. Faux, Coleorton.

PIGEONS.

ROCK OR DOVECOCK.—1 and 2, W. R. Dick, Ticknall.

ANTWERP OR BELGIANS.—1, F. Holbrook. 2, J. Langley, Mickelover.

TUMBLERS.—1, J. A. Wheatcroft. 2, W. E. Barrows, Derby.

FANTAILS.—1 and 2, F. Holbrook. *hc.* J. Wood, Soudon.

ANY OTHER DISTINCT VARIETY.—1, 2, and *hc.* J. Wood.

furnishing me with the name and address of any person who keeps this variety.—JOSEPH KING, Secretary.

WETHERBY POULTRY SHOW.

THE thirty-fourth Show of the Wetherby Agricultural Society was held in a field on Colonel Gunter's estate, on September 25th. The day was very fine, and a large number of fashionable people from the popular watering-place of Harrogate visited the Show. The poultry prizes were very poor, a policy the folly of which we wish to impress upon the Council of this Society; the entries, consequently, were not large, and yet there were some very good specimens. *Geese* were good, but both classes of *Ducks* were even better, *Rouens* and *Aylesburies* winning respectively in both young and old. The two pens of *Guinea Fowls* were fine; while *Cochins* and *Spanish* were very poor; but, as might be expected, the *Dorkings* in both classes were very good, the young, especially, being birds of great frame. *Game* were of moderate quality, while both *Polands* and *Hamburgs* were very poor. In the Variety class *Crève-Coeurs* were first, and very pretty *Silkie* second. In pullet and cockerel first were *Light Brahmas*, second *Black Hamburgs*.

In most of the classes of *Bantams* some misconception of the rules had led to the mixing of old and young in the adult class, and the consequence was that some of the best in the two classes had to be left out. In *Bantams* young *Game* were first and *Black* second.

PIGEONS had but one class with twenty-three entries, and some very good birds were shown. Prizes were awarded in duplicate. First, by a long way, was a very good pair of *Blue English Owls*; extra first, good *Red Pouters*. Second came a pair of *Silver Dun Antwerps*; extra second, young *Dun Carriers*. Third, *White Pouters*; and extra third, *Red Jacobias*.

RABBITS, one class, brought eight entries; the first were *Sooty Fawn Lops*, and second *Grey-and-white Lops*.

GESE.—1, J. Simpson. 2, O. A. Young, Driffield. *hc.* and *c.* J. Farrar, Brackenthwaite.

DUCKS.—1 and 2, Carver, Boroughbridge. *c.* O. A. Young. *Ducklings.*—1 and 2, Carver. *hc.* O. A. Young.

GUINEA FOWLS.—1, O. A. Young. 2, J. Farrar.

COCHIN-CHINAS.—1 and 2, R. J. Raworth, Harrogate. *c.* O. A. Young. *Chickens.*—1, Ibottson, Whitby. 2, W. Stanton, Driffield. *hc.*—Ibottson; W. Stanton.

SPANISH.—*Black.*—*Chickens.*—1, O. A. Young.

DORRINGS.—1, T. E. Kell, Wetherby. 2, J. Robshaw, Whitley. *Chickens.*—1 and *hc.* T. E. Kell.

GAME.—1 and *hc.* J. Watson, Knaresborough. 2, O. A. Young. *c.* J. Robshaw. *Chickens.*—1 and *hc.* J. Watson. 2, O. A. Young.

POLAND.—1, Miss Payne, Galway. 2, C. Walker, Boroughbridge. *Chickens.*—1, O. A. Young. 2, Miss Payne. *c.* C. Walker.

PHASANT.—*Golden.*—1, Carver. *Silver.*—*Chickens.*—1, J. Robshaw.

CHITTIPAT.—1, Wells & Sherwin. 2, B. Myers, Chint. *c.* J. Robshaw. *Chickens.*—1, N. Williams, Knaresborough. 2, B. Myers.

BAND OR CROSS BREED.—1, O. A. Young. *Chickens.*—1, Carver. 2, Blackborough & Holdsworth. *hc.* O. A. Young; J. Robshaw; N. Williams.

BANTAM.—*Silver or Gold-pencilled.*—1, F. Iswell, Knaresborough. 2, Wells & Sherwin. *Black.*—1, O. A. Young. *Any other variety.*—1, C. Triffitt. 2, Blackborough & Holdsworth. *Any variety.*—1, Wells & Sherwin. 2 and *hc.*—Carver. *c.* Wells & Sherwin.

PIGEONS.—1, T. E. Kell; Wells & Sherwin. 2, Carver; T. E. Kell. 3, Wells & Sherwin; O. A. Young. *hc.* T. E. Kell (2); Wells & Sherwin (2); O. A. Young. *c.* T. E. Kell; R. Pickersgill.

RABBITS.—1 and 2, J. Wharton, Bramham. *hc.* G. H. Atkinson, Wetherby.

JUDGE.—Mr. E. Hutton.

CHADDERTON POULTRY SHOW.

THE meeting of the Chadderton Agricultural Society was held September 26th, and in addition there was a magnificent collection of poultry, all of this year. The pens were roomy wire ones, and were well arranged on two sides of the field. The day was beautifully fine and warm, in fact a thorough summer day; and in the afternoon we were pleased to see indications of the Society not being without considerable funds for the next year, for visitors poured in by thousands.

The *Game* class was the first, they were all shown in pairs. There were eight entries, and the Judges awarded three high commendations besides the two prizes; the first went to a really grand pen of *Brown Reds*; the second to good *Piles*. The commended pens were all *Brown Reds*. The prize *Spanish* were very good, both first and second. In *Cochins*, the first went to a really good pen of *Partridge*, the second to nearly as good a pen of *Buffs*. In *Brahmas*, all were *Dark* except one pen. The first was a grand pen in all respects, the second nearly equal except the pullet. The very highly commended pen was really good, the pullet better than in the second-prize pen, but not equal in cockerel. Only the first-prize *Dorkings* possessed much merit. The *Golden-spangled Hamburgs* were good; the *Silver* very good. Of *Golden-pencilled* the prize birds were very good, and in *Silver-pencilled* the same. We now come to the best class in the Show, the *Black Hamburgs*, they were really grand—ten pens, and not an indifferent one among them. An extra second was given, one very high commendation, and two high commendations. The cup for the best pen of *Hamburgs*

was awarded here to one of the best pens we ever saw, good in comb, earlobe, and very brilliant in colour. They were bred and owned by one of the oldest breeders in that locality, and he has reason to be proud of his success. The Variety class were all poor. There were some good Game Bantams; first were Duckwings, second Black Reds.

The Aylesbury Ducks were a good class, but the Rouens were the best and the largest class, containing fourteen entries, and many of them were good large birds. Of Geese there were eight entries, the winners very large.

PIGEONS.—Tumbler came first in the list. First were good Mottles, second good Kites. Carriers were a medium class. In Owls there were fourteen entries, and four were highly commended besides the prize pens. This was a good class. In Dragons there were fifteen entries, some very good birds, but as a class we thought it not so good as some we have seen of late. Belgians were divided into two classes, Long and Short-faced; seven entries in the former, and eleven in the latter. Most of these were very good. In the Variety class there were twenty entries, and some extraordinarily good birds were amongst them.

RABBITS.—There were only two classes, Lop-eared and Any other variety, but there was nothing of great merit.

GAME—Chickens.—1, C. W. Brierley, Middleton. 2, J. Fortune, Morton Banks, Keigley. *he*, M. Ormrod, Walleden, Todmorden (2); W. Barker, Grexholme, Todmorden.

SPANISH—Chickens.—1 and 2, H. Wilkinson, Skipton.

COCHIN-CHINA—Chickens.—1 and 2, C. Sidgwick, Keighley. *c*, J. Crabtree, Tongue.

BRAMA—Chickens.—1 and 2, T. T. Ansdel. *the*, J. Walker, Rochdale. *he*, J. Loe, Bromley, Clonmore.

DORRINGS—Chickens.—1, J. Walker. 2, T. W. Winstanley, Hollinwood.

HAMBURG—Golden-spangled—Chickens.—1, J. Andrews, Waterhouses, Ashton. 2, J. Long. *he*, W. Simpson. *Silver-spangled—Chickens.*—1, J. Lancashire, Middleton. 2, S. Lancashire, Middleton. *the*, J. Long.

HAMBURG—Golden-pencilled—Chickens.—1, W. Clayton, Keighley. 2, J. Long. *he*, J. Chadwick, Higher Shore, Littleborough. *Silver-pencilled—Chickens.*—1, J. Long. 2, H. Smith, Keighley. *he*, S. Newton, Chadderton.

LANGSHIRE—Black—Chickens.—1, S. Lancashire. 2, M. Lancashire; J. Long. *the*, C. Sidgwick. *he*, H. Hoyle, Littleborough. *Newcastle—Chickens.*—1, J. Long. 2, H. Hoyle, Littleborough; J. Chadwick.

ANY OTHER VARIETY—Chickens.—1, N. Shore, Littleborough; J. Chadwick. **GAME BANTAMS—Chickens.**—1, R. J. Hartley, Altrincham. 2, W. Baskivell, Halliwell. *he*, R. J. Hartley; W. Baskivell.

SELLING CLASS—Chickens.—1, R. H. Ashton, Mottram, Manchester. 2, J. Ashton, Craggate, Hollinwood.

CHICKENS.—1 and 2, K. Dawson, Cowlshaw, Shaw. *he*, H. Hoyle, Newchurch. *Ducks.*—1, S. E. Kettlewell, Ashton. 2, R. White, Manchester. *he*, T. Wakefield, Golborn, Newton-Willows. *he*, R. Hutchinson, Shaw Moss, Littleborough (2).

ROUENS.—1, J. Walker. 2, T. Wakefield. *the*, S. Dronsfield, Werneth. *he*, J. Walker; W. H. Rothwell, Milnrow.

GEES.—1 and 2, J. Walker. *he*, S. Dronsfield, Werneth. *c*, N. Harrison, Middleton.

TURKEYS.—1, J. Walker. 2, J. & J. Jagger, Oldham.

PIGEONS.

TUMBLERS.—1, W. A. Hyde, Hurst, Ashton. 2, W. J. Warburton, Knowles, Stalybridge. *he*, J. Stanley, Blackburn.

CARRIERS.—1 and 2, J. Stanley. *he*, S. Dronsfield, Werneth.

DUCKS.—1, S. E. Kettlewell, Ashton. 2, R. White, Manchester. *he*, A. Hunter, Middleton. 1, W. J. Warburton, W. A. Hyde; R. White.

DRAGONS.—1, J. Stanley, Blackburn. 2, R. White, S. Dronsfield (2).

BELGIANS—Long-faced.—1 and 2, C. Hopwood, Rochdale. *he*, T. Grunby, Tongue. *Short-faced.*—1, C. Sutcliffe, Todmorden. 2, J. Stanley. *he*, C. Sutcliffe. *W. White* (2).

ANY VARIETY.—1, G. M. Gurtiside, Broughton. 2, S. Dronsfield. *he*, W. Richardson (2); W. A. Hyde.

RABBITS.—*Spanish—Buck or Doe.*—1, E. Higham, Middleton. 2, B. Consterline, Rochdale. *Any variety.*—1, J. S. Johnson, Oldham. 2, H. Scholes, Oldham.

Mr. James Dixon, Bradford, and Mr. Peter Eden, Manchester, officiated as Judges.

DENBIGHSHIRE AND FLINTSHIRE POULTRY SHOW.

This, in connection with the annual agricultural exhibition of the Society, was held on the 22nd of September at Ruthin. The Turkeys formed the finest class in the Show.

DORRINGS.—1, Col. T. N. Leyland, Ruthin. 2, T. Roddick, Penhebbwchaf, Nannerreh.

GAME.—1, A. Rickman, Ruthin. 2, C. Miller, Gwysaney, Mold.

SPANISH.—1, C. Miller. 2, J. Watson, Penbedw, Mold.

ANY OTHER BREED.—1, R. Taylor, Plas Captain, Denbigh. 2, Col. T. N. Leyland. *he*, G. T. Pelham, Wern, Abergel; A. Rickman.

TURKEYS.—1, J. Griffiths, Wrexham. 2, W. Smith, Plas Towerbridge.

DUCKS.—Aylesbury.—1, J. Watson. 2, J. F. Jesse, Caeflon, Ruthin. *he*, J. Griffiths; L. Roberts, Ruthin. *Any other breed.*—1, Col. B. G. D. Cooke, Colwynby. 2, C. Miller. *he*, C. Miller; C. T. Pelham; R. Bizard. *c*, R. Blexard.

GEES.—1, R. Taylor. 2, W. Humphreys, Denbigh. *he*, T. Roddick; J. Roberts, Bacheirig, Ruthin.

The Judges were Mr. James Dixon, Cheater, and Mr. W. Gamon, Brook House, Chester.

CRYSTAL PALACE CAT SHOW.

This opened on Saturday last, and was continued on the following Monday and Tuesday. The entries numbered more than 350 Cats and kittens, all of which were good specimens, and it would appear that the public are becoming educated in Cat Shows, for all specimens but two sent in were in accordance with the descriptions in the schedule, while formerly it was the exception to have them put in their proper classes. The Show was held in the north nave of the Palace, a double row of cages

extending down the centre of the nave, and a row on either side, backed up with green baize. Statuary and flowers were interspersed, which added to the general effect. The sales of Cats were very brisk in comparison with all previous shows. One Cat was sold for £10 lbs., and another for £5 5s. All the animals were well cared for; they had plenty of fresh milk twice a day besides boiled meat.

SHORT-HAIRD TORTOISESHELL-AND-WHITE (1 entry).—*Male*.—1, J. Hurry.

SHORT-HAIRD BROWN TABBY (11 entries).—*Male*.—1, Mrs. Spinks. 2 and 3, Mrs. E. Edwood.

SHORT-HAIRD BLUE OR SILVER TABBY (5 entries).—*Male*.—1, F. W. Reynolds.

2, E. Davy. 3, G. Ellis.

SHORT-HAIRD RED TABBY (3 entries).—*Male*.—1, T. Stratton. 2, Mrs. J. Rowley. 3, Withheld.

SHORT-HAIRD RED TABBY-AND-WHITE (4 entries).—*Male*.—1, T. Newmarch.

2, W. Birch. 3, Miss C. Moore.

SHORT-HAIRD SPOTTED TABBY (13 entries).—*Male*.—1, T. Weightman. 2, Mrs. Newton. 3, Mrs. C. Smith. *he*, F. Tyler.

SHORT-HAIRD BLACK-AND-WHITE (11 entries).—*Male*.—1, R. Penwill. 2, J. Bradden. 3, Miss Ferguson.

SHORT-HAIRD BLACK (5 entries).—*Male*.—1, J. Harpin. 2, Miss Terry. 3, Mrs. Shuckard.

SHORT-HAIRD WHITE (8 entries).—*Male*.—1, Mrs. Luckin. 2, Mrs. G. Kittlety.

3, W. Halley. *he*, Mrs. J. Humphrey.

SHORT-HAIRD UNUSUAL COLOUR (1 entry).—*Male*.—1, Mrs. S. Barnes.

ANY OTHER VARIETY OF COLOUR OR SINGULAR FORM OF SPECIES, MANX, &c. (5 entries).—1, P. Williams. 2, M. White.

SHORT-HAIRD TORTOISESHELL (7 entries).—*Female*.—1, J. T. Alcock. 2, E. Horner. 3, W. Clarke. *c*, J. Penwill; Miss B. Billett.

SHORT-HAIRD TORTOISESHELL-AND-WHITE (11 entries).—*Female*.—1, H. H. Wood. 2 and 3, H. Stroffon. *he*, J. Bathurst; Master A. W. Boatright; Mrs. Penwill. *c*, Miss B. Billett.

SHORT-HAIRD BROWN TABBY (7 entries).—*Female*.—1, A. Heller. 2, Withheld. 3, Mrs. J. Edwards. *he*, Mrs. Scott.

SHORT-HAIRD BLUE OR SILVER TABBY (3 entries).—*Female*.—1, M. White. 2 and 3, Withheld.

SHORT-HAIRD RED TABBY-AND-WHITE (2 entries).—*Female*.—1, T. Sayer. 2, W. Birch.

SHORT-HAIRD SPOTTED TABBY (4 entries).—*Female*.—1, Miss M. Moore. 2, Mrs. Newton. 3, Mrs. R. Martin.

SHORT-HAIRD BLACK-AND-WHITE (5 entries).—*Female*.—1, J. Harpin. 2, H. Ranson. 3, J. Gesssey.

SHORT-HAIRD BLACK (4 entries).—*Female*.—1, T. Weightman. 2, Miss Merchant. 3, Mrs. Shuckard. *he*, E. Perry.

SHORT-HAIRD WHITE (6 entries).—*Female*.—1, Miss Shears. 2, Miss M. A. Willman. 3, E. R. Caddon.

SHORT-HAIRD UNUSUAL COLOURS (8 entries).—*Female*.—1, Walter. 2, W. K. *he*, 3, W. Wooker. *he*, Miss A. A. Barrett.

ANY OTHER VARIETY OR ABNORMAL FORMATION (5 entries).—1, E. Palmer (Manx). 2, M. White (Manx). 3, R. Williams (Manx). *he*, Miss Sprague.

FOR THE TWO BEST MARKED KITTENS, ANY VARIETY, UNDER SIX MONTHS OLD (20 entries).—1, W. Sully. Equal 2, Misses Wragge; Miss Le Neve Foster. 3, Miss A. A. Barrett. *he*, Misses E. A. & F. Hounde; Mrs. H. C. Organ; Miss Brander; Mrs. M. Willmott.

LONG-HAIRD PURE WHITE (8 entries).—*Male*.—1, Miss E. Fogerty. 2, Miss A. Gannon. 3, T. Weightman.

LONG-HAIRD TABBY (4 entries).—*Male*.—1, S. K. Shalbolt. 2 and 3, Withheld.

LONG-HAIRD UNUSUAL COLOUR (2 entries).—*Male*.—1, Miss E. S. Thompson. 2, Mrs. Lee.

LONG-HAIRD PURE WHITE (13 entries).—*Female*.—1, Miss N. Martin. 2, H. M. Maynard. 3, Miss S. A. Pocock. *he*, Mrs. O. Roedel. *c*, J. S. Pocock.

LONG-HAIRD BLACK (1 entry).—*Female*.—1, Miss M. Ambridge.

LONG-HAIRD TABBY (12 entries).—*Female*.—1, Mrs. H. C. Organ. 2, W. Appleton. 3, Mrs. Thomson. *he*, Mrs. Eavie; F. F. Edwards.

LONG-HAIRD UNUSUAL COLOUR (5 entries).—*Female*.—1, Miss J. Amor. 2, Mrs. Brander. 3, J. Penwill.

FOR THE TWO BEST LONG-HAIRD KITTENS UNDER SIX MONTHS OLD (21 entries).—1, Mrs. F. Roth. 2 and 3, Miss M. Cottingham. *the*, J. S. Pocock. *he*, Mrs. H. C. Organ; Miss E. Ackland; R. Penwill.

FOR THE BEST ANGORA OR PERSIAN IN THE SHOW (2 entries).—*Male* or *Female*.—Medal, J. Brotherton.

CATS OF NO SEX, JUDGED BY WEIGHT ONLY.

HAVIEST SHORT-HAIRD—BLACK, BLACK-AND-WHITE (7 entries).—Equal 1, Mrs. W. Loree (13 lbs.); D. Taylor (13 lbs.). 2, P. J. Harrison (12 lbs.). 3, Mrs. E. Bain (12 lbs.).

HAVIEST SHORT-HAIRD—WHITE (4 entries).—Equal 1, Mrs. T. W. Minton (12 lbs.); C. W. Fletcher (12 lbs.). 2, Mrs. J. Isherwood (12 lbs.). 3, Withheld.

HAVIEST SHORT-HAIRD TABBY, ANY COLOUR (7 entries).—1, C. F. Smith (15 lb. 12 oz.). 2, W. Crole (15 lbs.). 3, Mrs. H. C. Organ (15 lbs.).

HAVIEST SHORT-HAIRD—UNUSUAL COLOUR (3 entries).—1, Mrs. Seaman (14 lbs.). 2, Mrs. Gunner (14 lbs.). 3, Withheld.

HAVIEST LONG-HAIRD—BLACK, BLACK-AND-WHITE (2 entries).—1, Mrs. Halsey (11 lbs.). 2, T. Weightman (10 lbs.).

HAVIEST LONG-HAIRD—WHITE (5 entries).—1, F. J. Goodall (12 lbs.). 2, G. Thompson (10 lbs.). 3, Mrs. F. Hodgson (9 lbs.).

HAVIEST LONG-HAIRD—TABBY, ANY COLOUR (4 entries).—1, Mrs. D. Hooper (9 lbs.). 2 and 3, Withheld.

HAVIEST LONG-HAIRD—UNUSUAL COLOUR (4 entries).—1, A. Mordredien (11 lbs.). 2, G. F. Cremer (10 lbs.). 3, H. Kuhlmann (9 lbs.).

ANY WILD OR HYBRID BETWEEN WILD AND DOMESTIC, OR OTHER (1 entry).—Withheld.

CATS BELONGING TO WORKING MEN.

BLACK-AND-WHITE (4 entries).—*Male*.—Prize, C. Vase. *c*, E. Mather.

TABBY-AND-WHITE (7 entries).—Prize, J. Smith. *he*, Mrs. T. Odle; W. Scrivener.

WHITE (4 entries).—Prize, J. W. Gesssey. *he*, Mrs. R. Day.

SHORT-HAIRD BLACK (7 entries).—Prize, W. Broderick. *he*, M. Odle; Mrs. Scott. *c*, E. Filler. *c*, Mrs. Gray.

LITTER OF SHORT-HAIRD KITTENS—ANY COLOUR (6 entries).—Prize, —Scalling. *he*, Mrs. J. Rowley; W. Hendle.

CATS OF NO SEX, BELONGING TO WORKING MEN, JUDGED BY WEIGHT ONLY.

HAVIEST SHORT-HAIRD—TABBY, ANY COLOUR (4 entries).—1, —Bryant (12 lbs.). 2 and 3, Withheld.

HAVIEST LONG-HAIRD—ANY COLOUR (2 entries).—1, J. Curtis (9 lbs.). 2, Mrs. Glendinning (9 lbs.).

JUDGES.—Mr. Harrison Weir, F.R.H.S.; Mr. J. Jenner Weir, F.L.S.; Mr. P. H. Jones.

BEE GOSSIP.

This year will not have proved an uninteresting or unimportant one in the annals of bee-keeping. There have been some discoveries made, as in the very curious account recently

given in these pages by unimpeachable eye-witnesses to the fact that bees will occasionally tolerate two queens in one hive, or what is perhaps equally strange, that two queens will live peaceably together, sharing the duties of royalty and maternity. It is only another instance of the old saying, that "there is no rule without an exception," albeit it is equally true that "the exception proves the rule." Once only in my experience have I met with a reported instance of a like kind, but it was hardly so well authenticated.

But it is chiefly in the science of bee-keeping as a profitable enterprise, and the attention which has been drawn to it publicly, that the year 1874 will be a notable one among bee-keepers. The establishment of a British Apian Society is a great fact, and it is to be hoped that no petty jealousies will stand in the way of its receiving the adhesion and support of all lovers of the "busy bee." It has always struck me as unaccountable that England should have been so behindhand in this respect, when our American and German brothers and cousins have for so long set us a good example. Pray do not let us pass by the present opportunity of retrieving our character for enterprise, but join the new confraternity with heart and purse. It is something to find the *Times* give space for column after column in consecutive numbers to a report of the Bee Show at the Crystal Palace; and now we have friendly reports coming in, as from "D., of Deal, whose tastes are various and extensive, ranging widely in the domain of art-assisted Nature.

Looking over the entries relating to hive-improvements, I am somewhat surprised to find none in the direction of self-adjusting hives, such as would give increase of space in an upward direction by means of a sliding case. Hives of this sort would be invaluable to those bee-keepers whose one object is honey, to the discouragement of swarming. They might be called "telescope" hives. I think I recollect some such hive being once described in this Journal, but it seems to have hardly obtained the attention it deserved—the principle of it I mean. Perhaps some of your readers have made trial of a hive of this sort, and would favour us with an account of it.—B. & W.

BEE-KEEPER'S CALENDAR FOR OCTOBER, NOVEMBER, AND DECEMBER.

UNDER proper management bees require no attention from September till March. Every hive should be examined after brood is all hatched to ascertain if there is any foul brood in it, and also to see if it has bees and honey enough to go well through the winter. Where feeding last month has not been attended to, it should be done as soon as possible. I have so often pointed out the danger of winter feeding that it need not be dwelt upon here. In cold weather bees can neither impart warmth nor food to their young; it is, therefore, desirable to avoid stimulating them unseasonably. By feeding them in October, especially if the weather be warm, it is easy to get a late hatch of brood. I frequently tried late feeding with a view to strengthen weak hives, but finding the loss greater than the gain have long since abandoned this practice.

The earlier autumn feeding is over the better. As soon as it is over, hives should be protected and covered well; indeed bees cannot be kept too warm in winter out of doors. Soft dry hay or grass 3 or 4 inches thick, placed compactly round every hive under the outer covering, is a good protection from the cold of winter. The earliest swarms last summer in this part of the world were those that were best covered and protected during the previous winter. Last month your readers were advised to contract the doors of their hives to keep out mice. When snow is on the ground bees should be kept in their hives. This cannot be too strongly insisted on. If bees come out when snow is on the ground they fall into it and perish. When there is no snow they may have a winter dance as often as they like.—A. PETTIGREW.

OUR LETTER BOX.

PULLETS LAYING (*Capt. L.*).—It is early, but not very unusual, therefore we need not trouble you further, but are equally obliged by your offer.

OLD BRAHMA COCK (*E. J. C.*).—We will not say the five-year Brahma cock is too old, but we should decidedly prefer something younger. We would not breed from him at that age.

ARRANGEMENT FOR POULTRY-KEEPING (*E. E. D.*).—Fifty fowls should have two acres if they are to be kept profitably. The information you quote is quite new to us, and we cannot think it is correct. Small chickens should be fed at first on boiled egg, bread and milk, cooked meat, curd, and meal. The next two months the chicken will eat more, but its food need not be so costly. It will, however, far exceed three farthings per week. The penny per week for an adult is marvellous, and on this small outlay she is to lay from 220 to 234 eggs; and these are to be sold at 1s. 3d. per dozen, making £14s. 6d. per annum. Cost according to Beaton's penny "Poultry Book," 4s. 6d. Profit for each hen, £1. As chickens are to cost one halfpenny per week for two months, then three farthings per week for two months, and one penny per week for the rest of life, this will, we think, be found a correct calculation. We wish the items of food had been given, with the addresses of those who sold them. We recollect when homo-opathically first came to the surface, it was defined as "a system by which the smallest possible dose was equal in its effects to the

largest." One of the early humorous prints said that a guardian of the poor, a thoroughly scientific man, applied the system to the dietary of the inmates of the workhouse. He gave six drops of gruel to a pailful of water. The inmates increased in weight. To gratify one of those philanthropic guardians who are always spoiling the poor, he added to each pailful six drops of rum. They made the inmates so quarrelsome, they were forbidden in future. Some such system must have been invented or discovered for chickens.

HOW TO BRAND HOUSING PIGEONS (*J. K. C.*).—The best way is to stamp with printer's ink on the flight feathers of the wing. Get a "die" made with your initials on it, and the number of the Pigeon, or, indeed, any mark on it according to your fancy. With a very simple arrangement of an inked flannel pad with which to ink the die, you can hand-stamp the wing. A dissembler would be the man to make the instrument you need.

BELGIAN HAIRE RABBIT—LOP-EAR SLIGHTLY WOUNDED (*Ignorance*).—A thoroughbred first-class Belgian Haire Rabbit should weigh from 7 lbs. to 8½ lbs. They sometimes reach 9 lbs. They should as nearly as possible approximate to the Haire in colour, shape, and habit. No visible white. Above all, no lop to the ears. They should be bright hare colour between the shoulders and towards the poll. They should sit as a Haire does in her form. They should carry their ears like a Haire, both upward and drooping. The small piece lost from the ear of the double-lop should not prevent you from showing it. In all adjudication, that which is perfect must take precedence of that which is defective, though the defect be the result of accident. There is too great a tendency in the present day to seek for dishonesty in exhibitions, and to tack on disqualified tickets. It is a pity, and it is often unjust. Where a feather is wanting in plumage which may be only of one colour there is room for suspicion, and the bird should be passed over; but where it is as likely to be from accident as design, and where there is apparently nothing to gain by it, it should be very leniently treated.

LOGHMAN BEES (*M. M.*).—Your safest course will be to write to the dealers in hives, &c., who advertise in our columns.

FEEDING BEES (*E. M. M.*).—Perhaps your simplest plan for feeding your bees is the bottle-feeder, as used and recommended by the late Mr. Woodbury. You can get it from Neighbour & Sons, High St. Born. Feed with a syrup made by pouring a quart of boiling water on 6 lbs. of good moist sugar. If too liquid add a little more sugar, if too thick a little more water. Stir well till the sugar is thoroughly dissolved. This is the food we are now using ourselves. Bees will feed from the bottle well in warm weather. The sooner you feed the better. Cover the mouth of the bottle with a bit of coarse lene. (*M. N. Carr*).—If you wish to preserve your bees in the empty hive, you must feed continuously for a month, giving them as much as they like to consume. They will require about 40 lbs. or 50 lbs. of sugar made up into syrup. Remember they have comb to make as well as to store the food. Unless you do the work thoroughly you will but spend money in vain.

REFUSE IN DESERTED HIVE (*G. H.*).—The piece of comb you sent from a deserted hive is loaded with bee-bread or pollen, but is in a sweet and natural condition. In this country bees gather far too much pollen, which occupies cells in the centres of hives that would be better employed for breeding purposes. The hive has, we think, lost its queen, and the bees have either deserted it or, more likely, dwindled gradually away. The deposit on the board is simply bee-bread which has fallen from the cells while robber bees were extracting honey from them.

REMARKS.

23rd.—Dull morning, wet forenoon, fair afternoon, and fine evening.
 24th.—Very foggy early, clearer by 9 A.M., but dull; fine afternoon and evening.
 25th.—Hazy morning, but a very bright day and night. Evening.
 26th.—Very fine warm day, very little movement in the air; hazy evening.
 27th.—A warm and rather close day, hazy and dark at times, especially about noon, but at times the sun very bright; lightning at 10 P.M., and rain at midnight.
 28th.—Fine morning and very pleasant day, being much less oppressive than the one preceding it. Lunar halo at 9 P.M.
 29th.—Fine forenoon, but dull afternoon.
 A fine warm week, the 25th unusually hot for the date; rain still very slight.—G. J. SYMONS.

COVENT GARDEN MARKET.—SEPTEMBER 30.

No change, a good supply of everything. Trade quiet.

From observations taken near London during forty-three years, the average day temperature of the week is 60.8°; and its night temperature 41.9°. The greatest heat was 80°, on the 14th, 1861; and the lowest cold 25°, on the 11th, 1860. The greatest fall of rain was 1.00 inch.

THE DAVIS BEQUEST.

THE new schedule for 1875 of the Royal Horticultural Society has been issued, and there is no mention of the Davis bequest. Many people ask, What is to be done with it? It is already well known that an attempt was made to apply it for the encouragement of what we have heard called "A Horticultural Derby," but the experiment was attended with difficulties, and the competitors who entered for the prizes were so few as to reduce the interest in the competition, and to render the attempt a complete failure. We are not aware that anything has yet been done in the way of devising a scheme which would meet the object Mr. Davis had in view, or what the intentions of the Council may be in regard to it; but we think that something which would be worthy of the reputation of so old and honourable a Society as the Royal Horticultural ought to be forthcoming.

In the absence of any better proposal we offer one which appears to us to be worthy of the attention of the Society, and one also which would do honour to it while it was honouring others. It is to institute MEDALS FOR MERIT. All the leading societies possess this power of rewarding, or at least of recognising, merit. The Royal has its gold medal, the Society of Arts its Albert medal, the Institute of British Architects and that of the Civil Engineers their medals, and there are the medals of the Royal Academy—all rewards for merit, which are eagerly sought after—why should not the Royal Horticultural Society have its medals for merit? Horticulture has its distinguished men and its eager votaries; but with the exception of the prizes which are won at horticultural shows, there is no other recognition of horticultural merit; and these prizes are confined exclusively to rewards for culture. The scientific horticulturist, the traveller who goes out with his life in his hand to pursue untrodden paths, and to grope his way through tropical forests and malarious swamps among barbarous peoples, what is his reward? What order of merit have we for him? Or the painful hybridist, who in his quiet undemonstrative way plods along, and astonishes us now and again with some wonderful feat of creation which puts much money into the pockets of culturists and exhibitors, but too often very little in his own—what order of merit is conferred on him? And the skilful cultivators, who whether they are exhibitors and win prizes, or whether they are not, they, too, ought to be thought of. There are many of our very best gardeners who are not exhibitors, and who are, therefore, never recognised. Then there are the writers on horticulture who are fairly entitled to have their merits rewarded. Horticulture is much indebted to its writers, and we feel sure that horticulturists will not be slow to reward merit in literature where it is deserved.

Now, from what source could such honours flow more appropriately than from the Royal Horticultural Society? It has no medals of the kind to confer as medals for merit, and never has had. The Davis fund affords an

opportunity now for its doing so, and we can see no better or more creditable way of applying it than by creating such medals as we have indicated.

Let us, by way of illustration, indicate what we mean. Who would say David Douglas or Hartweg, or the Cunninghams, or Mr. Skinner, were not entitled to this medal for merit had they been alive? and yet we have among us Mr. Fortune who has contributed to our gardens as many trees and shrubs and lovely flowers as any of these have done—popular flowers, flowers to be met with in every cottage garden and cottage window, on market stalls and hucksters' barrows—surely he might have a medal of merit? Then there are the great hybridists, men like Mr. Dominy, Colonel Trevor Clarke, Mr. Rivers, Mr. Laxton, Dr. Denny, Mr. Sedden, and others—men who by mental ingenuity if not by physical exertion, like the travellers, have enriched our collections and added to our pleasures, with too often the travellers' scant reward. And the cultivators, are there not names which flash across the memory suggesting men worthy of such honour? The Thomsons, Mr. Hunter, Mr. Fowler, Mr. Speed, and others are but types of the class. And lastly, there are the literary workers, of whom there are now and then some who might be thus distinguished. Such a man was Mr. Loudon; and who would have denied to Donald Beaton and Robert Fish such an honour had they been alive? There are men among us still plying their brains in the interests of horticulture who have no other opportunity of a reward for merit except such a one as we have indicated; and among these there are the scientific horticulturists, they who apply science to practice, and combining the two render valuable services to horticulture. Such men are the Rev. M. J. Berkeley, Mr. J. G. Baker, and others.

We throw out this as a hint to the Council of the Royal Horticultural Society whom we know have the best interests of horticulture at heart, and we hope it may find such favour as to stimulate them to take some step towards promoting so laudable an object.

A PEEP INTO FROGMORE.

It is common to associate with royalty grandeur and magnificence. One is apt to fancy the royal scullery, royal kitchen, royal farm, and royal garden as superseding all and everything of the same nature to be found in the island over which our gracious Queen reigns so benignly and so well. We think that every latest improvement, every modern appliance, everything which money can buy and the heart wish for, is provided *ad lib.* for the convenience of the royal servants in all the respective departments. Mayhap it is so. But in glancing over the place—the garden at any rate—an idea takes hold of the mind and clings there, that the same principles which govern most places govern this—viz., that the means are not more than sufficient for the requirements. Utility might be written on every house, and plant, and man at Frogmore, for every house was full, every plant had a purpose, and every man was at work.

It was in April I had my peep. The majestic castle was closed, but the not less majestic Elm avenue was opening the fresh green foliage, and just adding another glow of life to the centuries of the past. The fruit trees were a mass of floriferous wreaths, bright with hope of a rich harvest of fruit. It may, however, have been, as it was in too many places, but the winding-sheet, emblematic of the death, almost before it had life, of the longed-for, the coveted, the useful fruit. But some trees were covered—that is, on walls, and they were covered, not merely veiled with a slender network of hemp, which is not to be depended on for keeping-out the frost, but with a closely-woven material affixed on rollers to draw-up and down as required. That is sensible covering, and in the end the most economical, judging it by the value of the crops produced. There are few things in gardening so half-done as fruit-tree covering. Better by far not cover at all than do it on the spider's-web principle, and disappointment will be the less. That is one specimen of the practical utility of Frogmore.

They were cutting Asparagus, forced of course. But it is not everywhere, not, indeed, in many places forced as for the royal table. The beds are covered-in with stont wood shutters—there may have been glass attached, I forget, it was only a rush through, as if the Guards were after us—but there appeared to be pipes running along the covered paths between bed and bed, and a boiler at the end to feed them. Simple and effectual again, and well worth the doing. But all over the beds were sticks stuck about. What for? Simply to tell where the blanks were, so that fresh roots could be put just where wanted at the right time for planting. A capital plan that. I know a garden where it is regularly adopted, and the beds are as fresh, and full, and good as they were forty years ago.

But a man is found to run us through the houses, they seemed so busy as hardly to be able to find one. He was very civil and obliging. Forcing of fruits and vegetables was, of course, in full swing. Dwarf Kidney Beans in enormous quantities were here, there, and everywhere. Shelves and stages were not only filled with pots, but borders were planted with them, and all bearing excellent crops. "What are the sorts you find the best? Some of the new ones must be splendid forciers," was innocently suggested. Mark the reply: "They may be good, but we find nothing so useful as the old Mohawk, and grow no other in quantity." And what is the quantity? The reply must be given by time instead of numbers. "We gather Dwarf Kidney Beans," said our guide, "nine months indoors and three months out." Dwarf Kidney-Bean forcing at Frogmore is evidently a gigantic work, well done, and the testimony to the old variety above named is no ordinary one. Moreover, it is as good outdoors as it is in, and for light soils especially it is a question if it has any superior, taking into account quality and productiveness.

Strawberry-forcing is another great work at Frogmore. Strawberries are grown by the thousand in large 48 and small 32-sized pots, the kinds used being Vicomtesse Hériart de Thury, Le Gros Sucré, Keens' Seedling, President, and Dr. Hogg. The second one named was very highly spoken of as a great-bearing excellent variety for forcing, and in truth it was then fine, but so also were the others. They were grown on shelves in different houses, yet one house was devoted entirely to this fruit. It was a span-roof with a high flat centre stage near the glass, and a table round the sides. The pots were plunged in leaves, and as the fruit was all neatly tied-up and supported above the foliage it was a fine sight. The man in charge was evidently proud of it, and well he might be, for it did him credit. The plants are not stacked to get root-dried in winter, but are simply protected by fern, and a portion, no doubt, in the fruit houses. So long as the drainage is right Strawberries will stand any amount of moisture at any season, as note the extraordinary crops of 1873 after the extraordinary downpour of rain of the preceding winter.

The Peach and Plum houses were carrying good crops, but we will glance at the Vines. No great attempts at gigantic bunches to startle the world and make we small fry stare, are evidenced in the vineries at Frogmore. The roof is made to carry as many rods as possible consistent with securing a great number of useful medium-sized bunches, and berries of good quality. In a word, everyday usefulness rather than show, excellence rather than size, would appear to be the ruling principle of Frogmore Grape-growing. The crops were heavy, and the inside borders were being fed with liquid manure. The foliage was disposed on what I always lay down as the right and safe guide, of light for every leaf, and always a leaf for light. If

those little words were always remembered it would, perhaps, be no worse for Grapes generally. Pot Vines, when I saw them, were on the point of ripening their fruit, and were heavily laden. They were trained-up the rafters, and if I remember rightly, the pots were plunged. Some of the canes had been purchased and some were home-grown, but all were good, the bought ones, perhaps, the best.

Let us look a moment at the Pines. It was only a walk down the pits and peep-in now and then. They are grown in deep pits filled with leaves to give the necessary bottom heat, for which there is no grand mechanical provision. But there are grand Pines. As seen in April they were simply in splendid order, and self and friend mutually agreed on the resolution that they would make somebody look-out before the season was over. They did so, and those staged at "the Palace" in September were right royal specimens. Than Pines nothing is better done at Frogmore, and if we do not envy, we may at least seek to emulate the skill of the able grower of them. The front walls of the pits are, perhaps, 4 feet high. Close to them was run a row of early Peas, to be followed by Tomatoes. Thus no space is lost, but every spot and site turned to useful account. To the plants. Well, plants here are grown to be spoiled. That is just it. They have to do duty in corridor and vestibule of the Castle, and the dry atmosphere, and draughts, and gas tell the old tale; yet clearly the best attention is given to cleanliness and cultural restoratives.

On the whole, Frogmore is managed excellently well, and worth a visit. But how did I get in? Patronage of course. A friend of mind was taking a pig to the royal farm—he is a royal pig now, and it was under the patronage of this animal, sharing the conveyance, that I got my peep into Frogmore, and was gratified. We cannot suppose that such influence is generally necessary to gain admittance, but it so happened, and I got a rush round without any fuss and was satisfied. I wrote my name in the visitors' book as I write it now.—J. WRIGHT.

NOVELTIES IN THE ROYAL GARDENS, KEW.

The Cape house is perfumed with the delicious odour of *Aponogeton distachyon*. It is flourishing in a large bell-glass of water, on which the leaves float, intermingling with the curious two-forked inflorescences. The pure white glistening bracts which subtend the flowers are the inevitable source of attraction. In contrast with these are the black anthers and dark green foliage. Its culture in this way is very simple. Select a bell-glass or other convenient vessel about 16 inches wide at the mouth, and about 22 deep. Place soil therein to a depth of 4 or 5 inches, and plant the roots just beneath the surface, three of which will be quite sufficient. Dung or other enriching material should be carefully avoided, as it merely serves to contaminate the water without conferring an equivalent benefit to the plant. Carefully pour in water so as not to disturb the soil; every week at least a portion should be drawn off and be replaced with fresh. It is convenient to do this by means of a siphon formed by bending a piece of small lead pipe or other tubing. The interest of this "thing of beauty" may be greatly enhanced by the addition of animal curiosities, and to those who possess aquariums containing such, this plant is to be earnestly recommended. To flower from the present onwards, plant about the end of August. There is yet time enough to have it in flower for the winter season. It is a native of the Cape of Good Hope.

Vitellia Canterburyana is one of the finest of all Palms. In the Palm house a well-developed specimen has long been grown as "*Areca* sp., from Lord Howe's Island," and has been recently proved the above. It is about 30 feet high, and is almost without doubt the finest in Europe. Those who are fortunate enough to obtain the seeds must not be surprised if they fail to grow. Seeds of the genus *Kentia* (of which this is a member), almost always reach this country dead. They should be sown in pots and plunged in a bottom heat of 85°. When the young plants are spreading their first leaf, pot in as small pots as will contain the roots without breaking, using a soil of equal parts peat and loam. Pure loam may be used when the plants are large, but for their infantile condition a lighter mixture is preferable. Small pots should always be used, as a quick growth is thereby favoured and less room required. It is of little moment if they become pot-bound; on receiving a shift young roots proceed from the stem, which supersede the old ones. When the plants are growing water

should be freely given at the roots, with plenty of syringing overhead. It does well in an intermediate house.

Cuphea silenoides is a very pretty annual with blood-purple-coloured flowers. It has been in flower several months in the herbaceous ground, and is still flowering freely. The plant is covered with clammy hairs. It is easily cultivated, as are, in fact, nearly all hardy annuals, a circumstance very greatly in their favour. Such being the case, and as many good things are amongst them, it is a mistake that they are not more grown than at present. An important point and one often neglected, is that sufficient room must be given for the development of each individual plant. It is an excellent plan to sow in a circular drill with an inside cross, the circle formed by pressing the rim of a large pot on the ground. In this way the patch can be more easily weeded and thinned than when sown broadcast.

Parrotia persica, a member of the Hamamelidæ, is one of the rarest of trees. Its leaves are now assuming their autumn colours, which render it very attractive during that season; they turn orange, yellow, and scarlet. Though quite hardy it is very suitable as a deciduous tree for planting against a wall. Indeed, in this position only does its beauty become well developed. It does exceedingly well with an eastern aspect. The best mode of propagation is to layer the lower branches; they root easily, and soon make symmetrical trees.

ELECTION OF ROSES.—No. 3.

In giving the lists of the nurserymen's votes, I may just mention that some persons appear to have considered that the Roses are placed by the electors in order of merit. In no single list is this the case. In the election of 1872 Mr. R. W. Beachey did place his in what he considered "order of merit;" he also wrote a very interesting article on the method of this voting, which appeared in "our Journal" about the same time as the election, but even his list is not thus given this year. The numbers are placed against them to insure the proper number of Roses being named, and they follow each other very often as they come in the catalogues. This accounts for the fact that Alfred Colomb is so often No. 1. Well, he is certainly A1, and therefore, perhaps, is somewhat entitled to head the list. There is one other way in which we may look at the election, and that is the position of the Roses as to quality—that is, as to being in the first twenty. This the following table shows, and if the two lists are compared it will be found that there is some difference—in some cases very marked—as to the position in order of merit.

VOTES.		VOTES.	
1, 2.	Maréchal Niel 38	20, 21.	Dr. Andry 12
3.	Alfred Colomb 38	22, 23.	Souvenir d'un Ami 12
3.	Charles Lefebvre 37		Ferdinand de Lesseps 11
4.	Madame Rothschild 35		Emilie Hansburg 11
5.	Marie Baumann 34	24, 25.	Camille Bernardin 10
6.	La France 34		Marguerite de St. Amand 10
7.	Comtesse d'Oxford 32	26, 27.	Eduard Morren 9
8.	Etienne Levet 31		Marie Rady 9
9.	Louis Van Houtte 31	28	Catherine Mernet 8
10.	Marquise de Castellane 26	to	Souvenir d'Elise 8
11, 12.	Madame Victor Verrier 24	30.	Horace Vernet 8
	Gloire de Dijon 21	31.	Niphotos 6
13, 14.	John Hopper 20		Xavier Olibo 4
	Duke of Edinburgh 20	32	Camille de Roban 4
15, 16.	Pierre Notting 18	to	Dupuy-Jamain 4
	François Michelon 18	to	Madame Lacharme 4

Mr. J. DURBIN, *Englischemoor Rosery, Bath*.—1, Alfred Colomb; 2, Charles Lefebvre; 3, Comtesse d'Oxford; 4, Duke of Edinburgh; 5, Edward Morren; 6, Duchesse de Moroy; 7, John Hopper; 8, La France; 9, Madame Rothschild; 10, Madame Clémence Joigneux; 11, Madame Hippolyte Jamin; 12, Mdlle. Bonnaire; 13, Mdlle. Eugénie Verdier; 14, Marie Baumann; 15, Maréchal Niel; 16, Etienne Levé; 17, Souvenir d'un Ami; 18, Devoniensis; 19, Catherine Mermet; 20, François Michelon; 21, Souvenir de Malmaison; 22, Gloire de Dijon; 23, Gloire de Vitry; 24, Mdlle. Sertot; 25, Mdlle. Annie Wood; 26, Paul Neron; 27, Madame Scipion Couchet; 28, Madame Victor Verdier; 29, Marquise de Gibot; 30, Marquise de Mortemart; 31, Marquise de Castellane; 32, Sophie Coquerel; 33, Louise Peyronny; 34, Louis Van Houtte; 35, Lord Macanlay; 36, Princess Mary of Cambridge; 37, Sénateur Vaisse; 38, Marguerite de St. Amand; 39, Jules Margottin; 40, François Lacharme; 41, Emilie Hausburg; 42, Anna de Diesbach; 43, Black Prince; 44, Camille Bernardin; 45, Dupuy-Jamain; 46, Pierre Selyetzky; 47, Elise Boelle; 48, Pierre Notting; 49, Charles Lee; 50, Boule de Neige.

—JOSEPH HINTON, *Warminster*.

I THINK that many readers of "our Journal" will be anxious, like myself, to thank Mr. Hinton for the treat he has been giving us during the last fortnight. The trouble he has taken must be immense, and it is pleasant to congratulate him on complete success.

In reading over the amateurs' lists I must confess to an individual feeling of work somewhat imperfect. "Were things to be done over again all would be wise." If my list were to write again, dear old Général Jacqueminot, Reynolds Hole, Devoniensis, and Boule de Neige would not be omitted; Madame Lacharme's place would be greatly endangered, and Captain Christy must have come in. But I have felt the difficulty strongly, which Mr. Hinton rather raises. What is a best Rose? I incline to think that, if asked to name twenty-four of the best exhibition, the best garden, and the best good all-round Roses, we should most of us give in three different lists; at any rate in the two former there would be considerable divergence. It is with great grief I see Charles Lefebvre displaced from the premier Rose throne, nor can I quite acquiesce in the sentence. I venture also to think that Ches-

hant Hybrid will certainly be seen high up at the next election. Why Abel Grand has been promoted into such a place of honour by a high authority in one instance puzzles me; nor am I quite satisfied with the way in which the "Old Glory," as my gardener calls it, has been treated. The once well-known owner of Brockham Lodge, here, used to sing—

"If ever condemned in the country to dwell,
Oh! give me the sweet shady side of Pall Mall."

And if restricted to one Rose, I believe that many would say, Give me Gloire de Dijon!

I must confess to disappointment at the way the summer Roses have fared. Surely Paul Rieaut has not even yet forfeited his place in "the box!" Charles Lawson is most vigorous, and of a lovely colour. I have not the pleasure of knowing your genial correspondent "D., Deal," in the flesh, but I greatly admire the Rev. H. Dombrain in the Rose bed. Referring to one other remark of Mr. Hinton, if he wishes to eliminate, why not restrict himself to those electors who agree in some certain number out of the fifty he asks for? and he might classify if he liked north, south, and mid-England. Roses evidently are very different in different localities.—ALAN CHEALES.

I WANT to thank Mr. Hinton and the electors for providing such a useful guide to small purchasers, who, like myself, cannot afford to buy a lot of new sorts with perfectly gorgeous descriptions, and in many instances nothing else to recommend them. The six Roses at the head of the poll in 1873 are all in the first fifteen of this year's election. Can anyone desire better advice than this? Does it not show that whilst there will always be great differences of individual opinion, not to say whimsical fancies, as to the merits of some Roses, yet the best will be first if proper means be used to arrive at an unprejudiced and impartial judgment? Let those who are about to begin Rose cultivation be advised to take the first six, twelve, eighteen, twenty-four, or more of the list published in the Journal of September 24th, and they may depend upon having, whichever number they decide on, a really unique and thoroughly satisfactory collection of its kind. By the time their ideas have enlarged to fifty or more varieties, enough experience will have been acquired to do without assistance, except in the selection of new sorts, and they may then indulge in as many whims and extravagancies as the state of their finances will permit.

That there are no really good white Hybrid Perpetuals is well known, yet perhaps for the sake of effect it would be desirable for everyone to have a plant of Boule de Neige, No. 77, or Louise Darzens, not placed, but more hardy and free-flowering than Boule de Neige. I will conclude with the hope, which will find an echo in the hearts of all Rose lovers, that we may soon have a snow-white Alfred Colomb or Charles Lefebvre.—E. L. W., Yeovil.

MR. HINTON is quite right in recommending beginners to try Marie Baumann. It is a mistake to consider this Rose a weak grower; Mr. George Paul in his last catalogue describes it as vigorous. Budded on the Briar it is a good healthy grower, rather strong than weak. Possibly Mr. Radelyffe has grown it only on the Manetti. I found it did not succeed so well on that stock, and I have of late grown it on the Briar only. I have nearly a hundred plants, and I am undecided whether this or La France is the best Hybrid Perpetual ever yet seen; one or the other is—at least in my estimation. The only fault I can find with Marie Baumann is that the flower-stalk being rather long and thin the Rose is apt to hang its head, as pointed out by Mr. Hinton. I wish Mr. Radelyffe lived nearer to me, and I would get him to come and see my plants of this lovely Rose when in full bloom. He would be delighted, and I am sure would say, "Marie Baumann for ever!" Louisa Van Houtte is robust here on the Briar, and Felix Genero strong on the Manetti. Louis XIV. used to grow very strongly with me here on the Manetti, but it was such an uncertain flower that I long since discarded it. It is a splendid flower, and not yet equalled in its colour when it comes in character, and its perfume is exquisite.

Madame Vidot should be worked anew every year on the Briar; the blooms on once-cut-back plants will in anything like a Rose soil be found on such plants all that can be desired. Of course this will only suit enthusiasts. People who buy their plants and "stick them in," and take no further trouble with them, cannot grow Madame Vidot, a Rose which, in my opinion, is not sufficiently valued. I think, however, that this

Rose is too formal in outline to suit the tastes of many. I was particularly struck last summer by the fact that several times when I pointed out what I thought a splendid bloom of this Rose to ladies—and ladies of taste too—that I got a very reluctant assent to my remark, "There is a fine Rose!" and on following the question up, I found that the Rose was "too formal." The best bloom of Madame Vidot I ever saw was shown by Mr. Cant several years ago at Epping. Although I find it do best on the Briar, I understood that this bloom was cut from a maiden Manetti plant. Madame Rivers, which seems to be closely related, curiously enough does here much better on the Manetti than on the Briar.—R. H. P.

You will, I am sure, be pleased to hear that Capt. Christy, Lacharme's new Rose, is a beauty. I cut my first bloom this morning. It will gladden the hearts of exhibitors, as it is full of substance, good foliage, the whole bearing of the plant first-rate.

Though rather exposed at Yatton, Somersaet, I can still cut really nice blooms of Fisher Holmes, Annie Wood, Vicomte Vigier, La France, Dupuy-Jamain, Pitord, Ferdinand de Lesseps, Capt. Lamure, Louisa Wood, John Keynes, Céline Forestier, Reine du Midi, Boule de Neige, David Pradel, Madame Bravy, Climbing Devoniensis, Paul Neron, America, and, of course, Gloire de Dijon, my desk looking quite gay as I write, Capt. Christy being a good centre.—J. HOBBS.

THE PELARGONIUM SOCIETY.

I THINK the meeting the other day at Kensington was quite as successful as we could anticipate. To start a society, form a committee, and be able to offer a few good prizes for next year, is not a bad beginning. The offer of £8 8s. for twelve plants is sure to produce competition, whilst good prizes for collections of small plants will insure variety, and the conditions insisted upon that the raiser's name shall be attached will satisfy the *amour propre* of those who produce new kinds. The public will be sure to benefit by seeing the best sorts in cultivation, whether raised here or on the Continent, and the raisers will be enabled to introduce fresh blood into their strains.

It was also pointed out by Dr. Masters that the species of Pelargonium being so numerous, the stimulus of our Society was very likely to result in fresh tribes of hybrids, which might be quite as ornamental as the Zonals and Nosegays already produced. Those who will help us ought to know that Dr. Denny, of Stoke Newington, is the treasurer; but I hope we shall soon see a list of the members published, and any of us will be glad to receive subscriptions: for such an object I do not object to beg. The subscription of members is 21s., but any sum shall be acknowledged by me with thanks.

I am looking out for ornamental species of Geraniums, and anyone having such to dispose of which they think might be useful for cross-breeding would oblige by letting me know. Can any of your readers inform us of the collections there may be in existence? It is a pity any material should lie dormant which might give rise to new beauties.—J. R. PEARSON, *Chilwell*.

VALLOTA PURPUREA.

I LATELY saw a notice of a seedling of this with a white spot on one of the petals. I have known the Vallota for thirty-two years, but this new variety I have not had the pleasure of seeing. It is rather odd to hear this Vallota named purplea, as it is not purple, but the late Mr. McNab, of the Edinburgh Botanic Gardens, told me that it took its name from the purple colour of the leaves at the top of the bulbs; but this seems to me an odd way of naming a plant.

I think the Vallota one of our best of bulbous-rooted plants, it blooms so freely every year; and though I used to see it grown in a stove, it will do equally well in a greenhouse; and it is so accommodating that it is grown out of doors as a hardy plant in Ayrshire, and at flower shows is exhibited as a hardy herbaceous plant. If it can stand our winters it will become a great addition to our hardy plants; a bed of it in bloom in September would be something desirable. I saw a pot plant of it last week in full bloom, and there had been thirty-four stems on it, but a few were cut when I saw it. It was grown in a pot a size larger than a No. 1, and was in fine health. The grower told me there were several varieties; but very possibly some plants may appear a little different, according as they are well or ill grown. The plant was brought from

the Cape of Good Hope a hundred years ago.—J. ADDISON, *Ormiston, Tranent, N.B.*

ROYAL HORTICULTURAL SOCIETY.

OCTOBER 7th.

THE exhibition of Fungi, which was the principal feature at this meeting, although of a most interesting character, was by no means large—indeed, in only two of the classes was there more than one exhibitor. The arrangement of having white labels for the edible kinds, red for the poisonous, and yellow for those which come under neither category, is an excellent idea, and adds much to the instructive character of the exhibition. In Class 1, for a collection arranged according to botanical affinities, equal first prizes were awarded to Mr. B. J. Austin, 6, Russell Street, Reading, and Mr. J. English, of Epping, who have each distinguished themselves at former shows. Among the edible species we noticed *Agaricus rubescens*, *procerus*, *nebularis*, *personatus*, *Orcella*, *prunulus*, *Oreades* (*Mouceron*) *sylvaticus*, *campestris*; *Coprinus comatus*, the *Maned Agaric*, one of the best; *Fistulina hepatica*, the *Liver* or *Beef-steak Fungus*, which is also excellent; *Russula heterophylla*, which must be carefully distinguished from a poisonous species having also a green tint; *Sparassis crispa*, *Hydnum repandum*, *Clavaria vermiculata* and *coralloides*, *Lycoperdon saccatum*, *Cantharellus cibarius*, or the highly-esteemed *Chantarelle*, *Boletus edulis*, *Hygrophorus virgatus*, and *Tremella foliacea*.

In the next class the best collection of edible Fungi came from Mr. B. J. Austin, and included most of the above, as well as *Lactarius deliciosus*, the *Giant Puffball*, but not large; *Boletus scaber*, *Tricholoma alba*, &c. Mr. English was second, and the same exhibitor was first with the only collection of new or rare species. In this were *Hydnum ferrugineum*, *Hymenochaete tabacina*, *Lentinus cochleatus*, *Helvella lacunosa*, *Cortinarius decolorata*, *Tremella tremulina*, and several others, all of which are of a doubtful character. There was also a class for cultivated edible Fungi not now known in a cultivated state, but it would appear as if no recent attempts have been made by private individuals in this direction, as no one came forward to claim the prizes.

Mrs. Chapman, 36, Lancaster Gate, exhibited a number of admirably-executed portraits of Fungi.

FRUIT COMMITTEE.—Alfred Smee, Esq., F.R.S., in the chair. Specimens of Gourda came from the Society's gardens, and among them was a variety of the *Bottle Gourda*. A dish of Shallots, very fine, was sent by Mr. Garland, of Killerton Gardens, Devon, which the Committee considered a good variety.

Messrs. Maule & Sons, Bristol, sent cut specimens of the fruit of *Pyrus* or *Cydonia japonica*, also marmalade made from the fruit, which fully confirms the first-class certificate awarded to it at the Society's Show at Bath. From Mr. Chamberlain, The Warren, Bushy Heath, came a handsome specimen of *Charlotte Rothchild Pine Apple*, weighing 8 lbs. 13 ozs., which received a commendation. A similar award was given to two handsome specimens of *Smooth-leaved Cayenne*, weighing 19½ lbs., from Mr. Jones, the Royal Gardens, Frogmore.

Mr. W. Paul, Waltham Cross, sent specimens of his new *Grape Waltham Cross* in good order, of fine colour and good flavour. He also sent a bunch of his new *Grape Winter Muscadine*, which the Committee requested should be seen again in January next. From Harrison Weir, Esq., Weirleigh, Brencley, came a seedling *Black Grape* named *The Artist*, grown in his ground viney—a good-looking *Grape*, which the Committee recommended should be grown in heat and sent again. *Madresfield Court* grown under the same conditions was shown by Mr. Weir in capital condition, and a cultural commendation was awarded. Another *Grape* came from Mr. Peter Grieve, of Culford Hall, but it was not ripe; the same exhibitor sent a *Pear* named *Lucy Grieve*, which also proved to be unripe. Mr. Bennett, of Hatfield Gardens, exhibited a dish of *De l'Archipel Figs*. The same exhibitor sent some hybrid *Melons*, which were passed. A seedling *Pear* from Mr. Stevens, Trentham Gardens, was likewise passed.

A dish of *Portugal Quinces* came from D. Baker, Esq., of Shirley Road, Southampton, which were awarded a letter of thanks. Mr. Webster, of Gordon Castle, Aberdeenshire, sent a seedling *Apple* called *Northern Dumpling*, which when judged with several other well-known and approved sorts was considered a very good sort for that locality. Messrs. Carter & Co., High Holborn, sent a new *Tomato*, a sport from *Hathaway's Excelair*, but yellow in colour. It was awarded a first-class certificate. A seedling *Apple* came from Mr. Perry, Albion Hotel, Woking Station, which was passed. It had a very high colour. Mr. Hooker, Toddington, Beds, sent a plate of a seedling *Damson* which was not ripe.

FLORAL COMMITTEE.—R. B. Postans, Esq., in the chair. From Messrs. Veitch, of Chelsea, came a large collection of *Orchids*, including a number of the hybrids raised at their establishment by Mr. Dominy. Among them were the lovely *Calanthe Veitchii*,

Cattleya Dominiana, *superba*, *hybrida picta*; several *Cypripediums*, as *Ashburtoniae*, a pan of the beautiful and very distinct *Cypripedium Sedeni*, and a seedling raised from C. Fairriannum and *insigne*. *Cattleya fausta*, a hybrid between C. Loddigesii and *exoniensis*, lilac purple, with a purple lip, rich yellow at the base, was awarded a first-class certificate. In the same group was a splendid specimen of *Odontoglossum grande*, with *Dendrobium McCarthiae*, the *Dove Plant*, and other species. Some cut blooms of Japanese *Chrysanthemums* also came from the same firm.

Messrs. E. G. Henderson & Son, St. John's Wood, sent pot plants of *Cratægus Pyracantha* loaded with fruit, a collection of *Pompon Dahlias*, and *Golden Chain* variegated *Thyme*, apparently an improvement on *Thymus aureo-marginatus*, along with which it was shown. Mr. J. Chambers, Westlake Nursery, had a first-class certificate for *Begonia Royalty*, with very large pale red flowers, and the plant of compact growth. *Odontoglossum crispum* (Alexandre) with a fine spike, but a poor variety as regards the size and colouring of the flower, was shown by Mr. G. Toll, Hullard Hall Nursery, Manchester. *Kniphofia McOWani*, with small heads of flowers, in fact a miniature *Tritoma*, exhibited by Mr. Green, Holmesdale Road, Regent's Park, received a first-class certificate. It seems likely to be useful, as being dwarfer than *Tritoma Uvaria*.

Mr. Marchant, gardener to General Haukey, Sandgate, sent shoots of the *Sweet Bay* finely berried, and of the *Tamarisk* densely set with bloom. From Mr. Crusell, Fairy Croft Nursery, Safron Walden, came *African* and *French Marigolds*, the former large, and the lemon and orange varieties of the latter excellent. Mr. B. Porter, gardener to Mrs. Benham, Sion House, Isleworth, sent a number of seedling varieties of *Tropæolum Lobbianum*, and of *Pentstemon*, which do not call for special remark; Messrs. Jackson & Son, Woking, *Rhododendron aureo-limbatum*, of which the leaves are partially edged with yellow, but the variegation is somewhat irregular, and chiefly confined to the upper portion of the leaf. The plant, however, is very neat in habit.

A few seedling *Dahlias* were exhibited, but the only one that gained an award was *Sarah McMillan*, deep rose, from Mr. Rawlings of Romford.

Mr. W. Paul of Waltham Cross sent six boxes of cut *Roses*; Messrs. Maule & Sons, Bristol, a few cut *Orchids*; and Mr. Woodbridge, gardener to the Duke of Northumberland, Sion House, shoots of *Vitis heterophylla* beautifully berried, and than which few plants could look more elegant and ornamental. A first-class certificate was awarded.

PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

CRINUM MOOREI. *Nat. ord.*, *Amarylhidaceæ*. *Linn.*, *Hexandria Monogynia*.—Native of South Africa. Flowers pink. "A hardy *Crinum* is a rarity in English gardens, and, except the beautiful *C. capense*, I know no other but this now in open-air cultivation; and beautiful as *C. capense* is, it is far exceeded in size, foliage, and colour by the subject of the present plate.

"*Crinum Moorei* was introduced into the Glasnevin Gardens in 1863 by a friend of Dr. Moore's, Mr. Webb, who had served on the commissariat staff of our army in South Africa, and had brought the seeds from the interior—as Dr. Moore thinks—of Natal. During the last five years the specimen from which the drawing was made has been planted in a border fronting the conservatory range at Glasnevin, without getting the slightest protection, flowering sometimes in autumn and at other times in spring. The leaves are cut up in winter, but the bulbs are not seriously hurt, and soon recover themselves, when they push out a fresh set of their broad, peculiarly-ribbed leaves, 18 to 20 inches long. The bulb is remarkably long, sometimes reaching 18 inches."—(*Bot. Mag.*, t. 6113.)

BRACHYSEMA UNDULATUM. *Nat. ord.*, *Leguminosæ*. *Linn.*, *Decandria Monogynia*.—Native of South-western Australia. Flowers purple and yellowish green. "*Brachysema undulatum* is a hard-wooded greenhouse shrub, requiring the same treatment as *Chorozemas*, &c. It was raised by Mr. Bull, with whom it flowered in April of the present year. A shrub, 4 to 6 feet high."—(*Ibid.*, t. 6114.)

DECAELONE ELEGANS. *Nat. ord.*, *Asclepiadaceæ*. *Linn.*, *Pentandria Monogynia*.—Native of Angola. Flowers yellow, with brownish-purple long spots. "During the month of June of the present year this extremely interesting plant flowered for the first time in England, in the collection of J. T. Peacock, Esq., of Sudbury House, Hammersmith. A few weeks later flowers were also produced by plants in the Royal Gardens, Kew. The plate has been drawn from Mr. Peacock's specimen, a compliment which is no more than is due to the zeal and enterprise which he has shown in the cultivation of

succulent plants. His plant has been grafted on a *Stapelia*, probably *S. Plantii*."—(*Ibid.*, t. 6115.)

KNIPHOFIA ROOPERI. *Nat. ord.*, Liliaceæ. *Linn.*, *Hexandria Monogynia*.—Native of South Africa. Flowers orange, tipped with scarlet. It is about 2 feet high.—(*Ibid.*, t. 6116.)

ACHILLEA AGERATIFOLIA. *Nat. ord.*, Compositæ. *Linn.*, *Syn-genesia Superflua*.—Native of Greece. Flowers white, with yellow disk. "This charming little plant is a native of the mountains of Greece, and was first detected (in Crete?) by Sibthorp, and it has since been gathered on the mainland by Prof. Orphanides, of Athens, in the middle region of Mount Olympus, at an elevation of 5-7000 feet.—(*Ibid.*, t. 6117.)

WESTWARD HO!—No. 2.

THE kindly influences which the *Journal* exercises on many of its supporters came to my aid at my next resting place, and to it I owe my pleasant *sojourn* at Cheltenham. My friends were (as nearly all Cheltenham was) away from home, and an acquaintance originated by our mutual love of flowers and our interest in the *Journal* stood me in good stead. I have previously described Dr. Abercrombie's garden in Suffolk Square, and the wonderfully fine *Pelargoniums*, *Carnations*, and *Pico-tees* grown by him. To him, as to a great many, this has been a trying season—to him more than many, for the soil of his garden is very light, and many plants which ought to have grown out and filled up their spaces did not do so; while what he calls his gem beds—small beds filled with different plants, were quite a failure. I noticed one very good effect produced on his long border by *Crystal Palace Gem Geranium*, the flowers being left on, which gave a very beautiful hue of colour. Owing to a change of gardeners and to an interregnum of some time his *Pelargoniums* were not quite up to the mark of last year, although very fine. Of course I could not be at Cheltenham without giving a look-in at Mr. Cypher's, who, however, seems at this season of the year to be in a chronic state of exhibiting. Travel where you may in the "west country," probably you will see huge vans, with "James Cypher" on them, performing an up-and-down movement, as I saw them at Bristol, or impeding your own train while they are being shunted. At such a time your ideas of flower shows are not of a very rosy character. Suffice it to say his plants, which were in the act of being packed when I was there, were of their usual excellence, and that the bouquets which Miss Cypher was making up were of that excellence which has won her so good a name not only in Cheltenham but all through the west.

Amongst those ornaments of a profession which can boast of so many good men and true with whom it has been my good fortune to make acquaintance, are men of very different bearing; and at the Taunton show last year I had promised Mr. Cramb, in response to his most pressing invitation, that I would if possible pay him a visit; and although it was a very hurried one, and although the glories of the place where he so ably acts as gardener have been amply detailed in the pages of this *Journal*, yet must I say something of my visit to

TORTWORTH.

Hurried it was indeed. I had promised to be at Bath in the evening, and I could not get away from Cheltenham until twelve; and when I arrived at Charfield station I found that I had to walk some two miles and a half to the house. The day was lovely, the country beautiful; and although I was companionless, I most thoroughly enjoyed a delightful walk. As I neared the well-known seat of Lord Ducie, on every side one saw the signs of a thoughtful landlord, for the delightful residences and well-kept grounds would strike any stranger; and when once entered the gardens, the care and skill manifested everywhere bore witness to the fact that it was under the management of a first-rate gardener, everything was in such perfect order. The kitchen gardens are at a good distance from the mansion, and are contiguous to a very excellent house in which Mr. Cramb resides, Lord Ducie being one of those employers who consider that their gardener is worthy of some better home than oftentimes falls to their lot.

In going through the long range of vineries I was particularly struck with the uniform goodness of both Vines and Grapes. It is well known that Mr. Cramb has been engaged in a controversy on the subject of calcareous soil and the injury it does to the Grape. Various statements have been made *pro* and *con* on the subject; but as Mr. Cramb truly said, "The proof of the pudding is in the eating. While I had the lime-

stone here I could not grow my Grapes properly; I took it all out, and you now see the result." And certainly nothing could be grander than they were. Along the back wall of the houses were some remarkably healthy plants of *Camellias* from which he had, he told me, taken an immense quantity of bloom. At the mansion all was in confusion. The conservatory erected a few years ago had become rotten, and a new one was in course of erection at a cost of £1000. In front of the house a very beautiful *parterre* was in full bloom; but I had only time to take a rapid glance over it, and the very beautiful stretch of landscape beyond, with its picturesque lake and surroundings.

I could only give this rapid glance at the beauties of Tortworth, but I made a promise, which I hope to fulfil, of spending a long day there next year, when I shall be able to say more about it to the readers of our *Journal*. I hurried on to Bath, where I meant to have visited Vellore, the beautiful seat of my much-esteemed friend the Rev. Charles Kemble, rector of Bath; but alas! when I arrived it was but to hear that he was laid low in illness, and that to the great regret of his fellow citizens he had that day resigned his living. I saw something, however, in the way of fruit-growing which I hope to tell about by-and-by.—D., *Deal*.

UTILISING LAWN MOWINGS.

A FRENCH correspondent sends the following on this subject, but there are few of our English gardeners who are not alive to their value. They are, he remarks, a manure but little used, but nevertheless useful in the garden. I refer more particularly to the grass cuttings of large parks, which, if collected in a heap and frequently watered, would in the course of two years form a manure suitable for kitchen-garden crops, and at the end of five or six years would be reduced to a vegetable mould especially suitable for Peas when mixed with the natural soil. This mould is particularly suitable for sandy soils, where it gives the best results; it may also be used in composts for herbaceous plants and Pine Apples. It would therefore, adds our French correspondent, be very desirable to turn to account in the above way the cut grass from the many beautiful parks and lawns of England.

THE BEAUTIFUL AND USEFUL INSECTS OF OUR GARDENS.—No. 25.

LISTENING one day to an individual who was humming an old English song, expressing the romantic wish, "I'd be a butterfly," &c., we suggested to a friend who, with some modifications of his own, holds in the main to the theory of evolution as propounded by certain philosophers of our time, that the words of this piece might be modified to suit modern knowledge, and made retrospective instead of prospective. "We do not really hope to be butterflies," said I; "but on your hypothesis we might sing, 'I was a butterfly' in the person of some ancestor." My friend assumed a severe look at such trifling with science. "No!" he replied, "there's no reason to suppose mankind passed through that stage of existence. From the successional order there were various offshoots during a long course of ages. Man, in the progress of his development, touched the borders of insect life, he may even have been an insect, but hardly a butterfly: he must have been one of the elementary types. Supposing I had a great aunt who married a John Smith, you would not say that I am the host of Smiths that may have descended from him, though these might claim me as a very distant relation." I politely acquiesced, and remarked, "Then, though Tennyson, in his call to us urging us to a nobler life, is right in saying—

"Live upwards, working out the best,
And let the ape and tiger die,"

we have no occasion to repudiate the qualities of a butterfly, because we haven't got them." But I have since thought how these qualities, or instincts if they are to be so called, are misunderstood by the most of us. The traditional character of a butterfly is that of a selfish, indolent, foolish creature, to whose career a speedy close seems a fitting penalty. Much of this is a mistake. On the other hand, as I am reminded by these sunny autumn days, there are numerous butterflies flying hither and thither, prudently filling themselves with honey while they can get it, in preparation for their life of repose during the winter. With prudence, too, these will ere long seek out fitting works in which they can await the call of the

spring, which summons them to preparation for the continuance of the species.

But of the seeming relationship between one species and another, in what we denominate "insect mimicry," we have some curious instances in the moth tribes. Thus, in the "Puss" (see fig. 90) and the "Kittens," of the genus *Dicranura*, the perfect insect looked at from below, as through the lid of a gauze-covered box on which it is resting, reminds us of the head of a white cat in miniature. The caterpillars also when in the dainty stage of their early life, as they rest on the leaves of the Willow, with their "horns" stretched out horizontally from the extremity of the body, look like black kittens greatly reduced, the similarity being increased by two little points on the head projecting like ears. These disappear at a later stage. Reference has been made to the Puss Moth (*D. vinula*) in a former series of papers, as associated with the Willow tree, but

back. The appendages or tubes at the anns (from the interior of which the caterpillar can at its will project slender filaments) are green, ringed with brown. Having arrived at maturity, the next thing one of these caterpillars requires is an abode for the winter. Accordingly, quitting the leaves it crawls to the trunk of some tree, and selecting a suitable spot between 2 and 4 feet from the ground, it forms a cocoon of strong glutinous silk with which it mingles fragments of the bark. This is ingeniously contrived so as to resemble the bark in which it is embedded, and only the eye of an expert can detect it. In a few weeks after it is finished, it is so hard that some force is required to penetrate the exterior with a knife.

The moth, as it is presumed, though its history is not so well known as that of the familiar *D. vinula*, is furnished with a solvent fluid, by means of which it dissolves away the wall of the cocoon when the time of emergence arrives. It is a furry-

looking creature, measuring about 2 inches across the expanded wings. These are of a pale grey, with a broad band of dark grey edged with a black and yellow line; beyond this are several waved black lines, and numerous black spots of small size are sprinkled over the wings. The grey body is surrounded by dingy bands. A slight mention should be made of the closely-connected species called the Sallow Kitten (*D. furcula*), a much rarer insect seemingly, yet which has many localities recorded. In Surrey, not far from London, I have taken the caterpillar on Sallows growing in a nursery garden. The perfect insects are so much alike that the distinctions are not easy to state in words, but if we examine a series of each we then see shades of difference. *D. furcula* is also a smaller insect than *D. bifida*. The adult caterpillars are, however, so far dissimilar that there cannot be a doubt about the distinctness of the two species, and in addition to that fact, we have also the one that each keeps to its

FIG. 90.—MALE PUSS MOTH AND LARVA.

its lesser relatives claim a notice as being occasional visitors to gardens, pretty, and decidedly non-injurious. The Poplar Kitten (*D. bifida*) need to occur about London pretty generally some years ago, though now growing scarce; it is, doubtless, still common in many counties of England, though not easy always to find. In gardens the caterpillar feeds on the *Taxus* *Populus* (*Populus balsamifera*), and I have taken it on a dwarf hedge of the black species (*P. nigra*) in Brompton, which bordered some pleasant gardens now occupied by a row of houses, in which there may be kittens and cats also of a different sort. The mother moth usually deposits her eggs by ones, twos, or threes, sometimes in June, although occasionally it may be later. The caterpillars when hatched hold very firmly to the leaves, liking best to attach themselves to the midrib; nor can these be shaken or beaten from a tree in the way the entomologist finds so efficacious with many kinds that drop at a sudden alarm. I fancy that the caterpillar of the Poplar Kitten must be in its habits not unlike the fat boy depicted by Dickens, with so shocking a propensity to sleep at unreasonable times, for Mr. Newman remarks that he has observed this caterpillar after it has done eating still continue clinging to the edge of the leaf in a torpid attitude. I am not sure, however, that Mr. Newman is right in assuming that it only feeds at night; at least, such is not the case in confinement. Its favourite position when not eating is the "upside attitude," with the head and the hinder segments raised. The head and face are brown, marked with delicate wavy lines, the body of a greyish brown, also marked, and edged with bright yellow; beneath, the caterpillar is of a fine apple green with purplish dots, this colour extending up the fifth segment till it touches a ridge which is situated on that part of the

particular food plant as a rule. One of the habits of the caterpillar of *D. furcula* is a "teaser" to the insect-hunter; it is fond of leaving the growing portions of the plant or tree, and settling on some withered leaf or dry twig when not actually in need of food. There is a far greater variety of colour in this caterpillar than in that of *D. bifida*, which makes it quite a beautiful object. The ground colour is white on the back, and apple green on the sides, the two shades being separated from each other by an irregular purple stripe; there are also lateral stripes of a deeper green. Besides these markings purple spots are arranged at intervals along the back and sides, some of them having white centres. There are also two orange patches on the seventh and eighth segments. The head is grey bordered with purple, the anal horns purple and white. In July, August, or September, we may find this on the Sallows; the cocoon made towards the close of the summer is like that of others in the genus, and in it the chrysalis remains till May or June. We have in Britain one more "Kitten," not a garden species, but it may be named here. This is the Alder Kitten *D. hibernica*, only discovered as yet in a few English counties, and seemingly most partial to the "Weald of Sussex." The food plant of this is the Alder.

Two moths, which are the English representatives of the genus *Chamaea*, resort to our gardens in September and October after dusk, attracted by the yet remaining flowers. I have not noticed them close to the metropolis; in Hertfordshire, especially in the districts about Brexbourne and Ware, which yield an abundance of the marsh plants that are the favourite food of the caterpillars, they are tolerably common, or were a few years ago. Not only do the moths hover over the flower beds, but they resort to Ivy-mantled walls, intent

on the honey afforded by the greenish blossoms of that late-flowering plant. These insects, popularly designated the "Sword-grasses," come eagerly also to the sugar spread as a trap for moths by the entomologist. The beauty of both is more conspicuous in the larval than in the moth state; still some persons much admire the rich tints of brown displayed on the wings of the Red Sword-grass (*C. vetusta*); the dark and crested thorax is also handsome. *C. exolita* has a certain similarity to its relative, though lighter in colour, and a trifle larger. Both have long and narrow wings, curiously puckered up when the moths are at rest, and giving them rather the aspect of withered leaves. An entomologist of some repute in our day, slightly given to exuberance of language in his earlier writings, tells us that when he first saw the caterpillar of *C. exolita* he "nearly screamed with delight." It was a pity he did not quite scream; and as he has given me an opportunity of outdoing him, I intend to scream when I see one, which is a pleasure yet in store, as circumstances have prevented me as yet from looking after these caterpillars at the right time and in the likely localities. This wonderful caterpillar is usually bright green, with two yellow stripes running from head to tail, and besides these a scarlet stripe edged above and below with white; there are also white spots on most of the segments, some of them surrounded with black. It has been observed feeding on the Creeping Plume Thistle (*Carduus arvensis*), and manages somehow to escape all injury from the sharp prickles of the plant. Other food plants are the Nest-harrow and the Bladder Campion, also the species of Scabious. If disturbed, these caterpillars fall from the plants on which they are feeding, bent in a loose ring. The caterpillars of *C. vetusta* are darker in colour, striped with yellow and black, and particularly distinguished from the preceding by the absence of the scarlet streak, and the presence of a much larger number of black and white dots. This species has been taken on the Docks, on Sedges, and other marsh plants. The chrysalis state lasts but a short time, as the caterpillars of these moths are full-grown in July. Where the ground is moist below they are said to avoid entering it, and undergo their change on the surface. Lastly, it should be added that the moths of both species hibernate, sheltering themselves from the cold and damp of winter in outhouses, barns, &c. They are seldom seen in the spring, when they reappear.—J. R. S. C.

GARDENING AT HOXTON IN OLDEN TIMES.

Hoxton was a favoured home of some of the most noted gardeners in the seventeenth and eighteenth centuries. One of the earliest of these was Gourle, who flourished in the reign of Charles II., and whose name has come down to us in an anagrammatic form attached to the Nectarine he successfully raised—viz., the Elruge. George Ricketts, Pearson, and William Darby are all three mentioned in Gibson's curious account of gardens near London, in December, 1691. Ricketts cultivated more than 100 kinds of Tulips, and he possessed the richest and most complete collection of flowering trees and shrubs in the kingdom; Pearson had the best assortment of Anemones about London, and sold them only to gentlemen; and Darby was known as one of the first in England to cultivate exotic plants. He was succeeded by John Cowell, in whose garden flourished the Cereus and the Glastonbury Thorn. A great American Aloe was bought by Darby when it was twenty years old, and it remained in his garden for forty years, after which it came into Cowell's possession. When it was seventy-two years old it began to open its crown for flowering, and in June, 1729, it flowered magnificently. Large numbers of visitors were drawn to the gardens to see this curiosity.

Another noted Hoxton gardener was Benedict Whitmill; but the most distinguished of the fraternity was Thomas Fairchild, who, by the judicious bequest of the small sum of £25, has succeeded in preventing his name from ever being forgotten. Fairchild united a love of science with the practice of his art, and contributed a paper on the motion of sap in plants to the Royal Society, which was printed in the "Philosophical Transactions." His grounds were afterwards known as Selby's Gardens, and extended from the west end of Ivy Lane to the New North Road. Here he cultivated a vineyard as late as 1722, which is said to have been one of the last in England.

Fairchild, by his will, dated February 21st, 1728, "gave and bequeathed to the trustees of the charity children of Hoxton, and their successors, and the churchwardens of the parish of St. Leonard, Shoreditch, and their successors, the sum of £25,

to be by them placed out at an interest for the payment of 20s. annually, for ever, for the preaching of a sermon in the said church of St. Leonard, Shoreditch, by the lecturer of the said parish, or such other person as the said trustees and churchwardens and their successors should think proper, in the afternoon of the Tuesday in every Whitsun week in each year, on some subject relating to natural history." Among the noted men who have delivered the lecture may be mentioned Dr. Stukely; the Rev. William Jones, of Nayland; the Rev. Samuel Ayseough; and Dr. Wilberforce, when Bishop of Oxford. In 1750 Stukely made a note in his journal of a visit to hear the lecture; and as the passage gives us a picture of the state of the neighbourhood of Hoxton at that date, we will quote it here:—"I went with Dr. Felke and other fellows to Shoreditch, to hear Dr. Denne preach Fairchild's sermon on the Beauties of the Vegetable World. We were entertained by Mr. Whetman, a merchant, at his elegant house by Moorfields, a pleasant place, encompass'd with gardens, stored with all sorts of curious flowers and shrubs, where we spent the day very agreeably, enjoying all the pleasures of the country in town."

Hoxton was once noted for balsamic wells, and a book was written upon them. Sir Philip Skippon, writing to Ray (December 13th, 1667), refers to "the sweet-smelling earth found in Captain Massey's garden, at Hogsden;" and eighteen years afterwards Sir Hans Sloane, in a letter to Ray (November 10th, 1685), gives a full account of the earth, and an analysis of the water found "near the new square at Hogsden." Whatever charms Hoxton may once have possessed, they are all gone now, and yet not many months ago, a London merchant purchased ground there, and built himself a house, which was finished, and fitted up with an elegant conservatory.—(Builder.)

NOTES AND GLEANINGS.

WE are gratified to find that Mr. JAMES SMITH, who has been so long at Exton Park, Rutlandshire, has been appointed to the gardens of the Earl of Dartmouth at Fatchull, near Wolverhampton; and in making this announcement we can but say that a better appointment could not have been made. He is succeeded by Mr. Aherne, from Arundel Castle Gardens.

—THIS season the VINTAGE OF CALIFORNIA will, it is estimated, amount to 10,000,000 gallons, against 4,000,000 in 1873, and 2,500,000 in 1872.

—IN St. Joseph County, Michigan, the YIELD OF PEPPER-MINT is not more than half a crop. It is estimated this year at 8000 lbs. Dry weather is the cause.

STRAWBERRY CULTURE.

I HAVE read a discussion between Dr. Roden and Mr. Douglas; and though on the whole I agree with the former, the latter, I believe, is quite right in saying a number of his plants die-out yearly; and Dr. Roden says what is likely to be true, that the soil with Mr. Douglas is not congenial for these plants, and such I have seen more than once. This district is famous for growing Strawberries, Raspberries, and Gooseberries. Fordell Dea, a place celebrated in Scotland for growing Strawberries, is within three miles of this; and the late Mr. Moffat, whose name is celebrated in Edinburgh for Fordell Dea Strawberries, told me he grew them for fourteen years without renewing them, and then he rested the land one year, manured it, and planted on the same land. But it is a deep heavy soil, and such the Strawberry delights in, while on land the reverse the plants will die-out yearly. I have been acquainted with Strawberries for forty-seven years, and the best I ever saw was at Glamis Castle, Forfar, this year. The sorts were Eclipse and Elton. Keens' Seedling was about past. At Yester, Haddingtonshire, the seat of the Marquis of Tweedale, they were equally good. The soil in both places is very strong and deep, and a little cold. About 1½ lb. would be gathered off one plant, but the plants were nearly 2 feet between each other, and nearly 3 feet between the rows. It was a treat to see the berries hanging round the plants. Within four miles of this there are two hundred acres of Strawberries grown, but at Ormiston three to four crops only are got, when the plants must be cleared off. The soil is lightish, with a gravelly sub-soil. The fruit is sent to Edinburgh, Glasgow, Dundee, and Aberdeen, often in barrels, but for the Edinburgh market it is sent in small round baskets which hold 1½ lb., and sell from 6d. to 1s. each. At 6d. they give a good return if the

crop is good. When planted in April the fruit is by far the largest the following year, but the crop will not be over half of what it will be the second year.—J. ANDERSON, *in situ*, Trenton, N.B.

LIQUORICE.

The root of this plant (*Glycyrrhiza*) has been commended as a pleasant and efficient medicine from the time of Theophrastus, and in every country it has a name meaning either "a sweet root" or "pleasant savour." Its botanical name, *Glycyrrhiza*, is literally "The Sweet Root." Lyte, writing in 1578, seems to have thought it almost the universal medicine, for he says, "Licorice and the juice thereof is a very good and wholesome medicine, fit to assuage paine, to soften, and make whole; very proper and agreeable to the breast, the lungs, the reins, the kidneys and the bladder." It is a native of southern Europe, but especially of Spain, where it is largely cultivated, and its insipid juice exported and known in commerce as "Spanish Licorice." Snow records that "the planting and growing of Licorice began in England about the first year of Elizabeth," 1558. It became so large a produce of the neighbourhood of the town in Yorkshire, the name of which was applied, that the dried juice acquired the name of "Pomewater Cakes."

HEATING BY GAS.

I noticed a short time ago one of your contributors recorded some of his failures for the guidance of others. I would like to communicate my experience in heating a greenhouse by gas, and in so doing my object is to deter others from trying gas for that purpose unless the experimenters have unlimited means, and the cost is quite a secondary consideration.

My house is shaded on three sides by high walls. The only sunny side is the east, and I get very little heat from the sun. The house is a span-roof about 8 feet 4 inches long by 7 feet wide. I have a gas boiler made by one of the best-known makers of gas boilers, and represented as intended to heat 50 to 60 feet of 2-inch piping. The boiler is outside the greenhouse, but joins quite close up to it, and is well covered-in by a small glazed potting-shed entirely protected from the weather. Up each side of the house are four rows of 1-inch piping—in all about 70 feet of 1-inch piping. The gas is conveyed from my kitchen. During the month of June I used gas for heating. In the town in which I live it appears that at 11 o'clock p.m. half the force of gas is turned off at the gasworks. From seven to eleven in the evening I got a very fair heat from it. After eleven the temperature fell very considerably; indeed, the heat was insufficient for the few exotic Ferns I

have. In order to get this temperature I burned (from 7 a.m. to 7 p.m.—that is, in twelve hours) 120 feet of gas. That means 240 feet a-day, or about 1750 feet a-week. I cannot infer from this exactly how much gas would be required to keep a sufficiently high temperature during twenty-four hours, but I should suppose it would require something like 2350 feet to keep my house at a suitable heat for exotic Ferns for a week's time. If so, and I do not think this would be sufficient, with gas at 4s. a thousand, this means 9s. a-week to heat a house 7 feet by 5 feet 4 inches. That the pipes and boiler were properly arranged I have no doubt, having since attached an ordinary coke boiler to the pipes.

If any of your correspondents can give information on this subject I am sure there are many people who would be most happy to learn how to heat their greenhouses at a reasonable cost without the trouble of spring-up. I enclose my address, and should be glad to avail myself of an opportunity of seeing some place heated by gas, and being assured about the cost. But from my experience I would caution others not to try it on the strength of *oukair de rose* advertisements and flattering reports. If any of your readers will communicate through the Journal where a house heated by gas can be seen, with the opportunity of seeing what gas is consumed, I will at some time avail myself of a visit; and if I find it can be done at a moderate cost I will try and spread the information to the extent of my ability, in the confidence that small greenhouses would spring-up by hundreds, and society would be benefited by the information.—A. SNOW.

LATE PEAS.

If I might venture to tack an addendum to Mr. Abbey's notes on Peas, I would name one I recently saw in the celebrated garden of Drumlanrig Castle. It is, Mr. Thomson assured me, the *Pea of Peas* for late work, and even *Ne*

Plus Ultra, good as it is, was set aside for extended plantations of the one I saw doing so well. I never heard the name nor saw the *Pea* before, but was at once arrested by its appearance. It is a tall grower, full of pods and blossom, and will go on producing until frost. As to quality, unless it was very good we may be very certain it would have no place there. Lynn's Black-eyed Marrow is its name. I have not seen it in any list. Mr. Thomson's supply is from Mr. Mathew, Edinburgh. Late Peas are such an important crop, that nothing really and specially good should be permitted to escape notice, and I note this variety because I saw it in such fine form, and because the authority as to its excellent qualities is so reliable.—J. WATSON.

EXTRACTION OF PLANTS.—The Commissioners of Her Majesty's Works and Public Buildings intend to give this

Fig. 11.—Licorice.

autumn, among the working classes and the poor inhabitants of London, the surplus bedding-out plants in Battersea, Hyde, the Regent's, and Victoria Parks, and in the Royal Gardens, Kew, and the Pleasure Gardens, Hampton Court. If the clergy, school committees, and others interested will make application to the Superintendent of the park nearest to their

respective parishes, or to the Director of the Royal Gardens, Kew, or the Superintendent of Hampton Court Gardens, in the cases of persons residing in those neighbourhoods, they will receive early intimation of the number of plants that can be allotted to each applicant, and of the time and manner of their distribution.

THE CARPET AND TAPESTRY BELLS AT HAMPTON COURT.—No. 4.

SEEDLING BRIARS.

In answer to Mr. R. W. Beachey, the fault is not in the Briar, it is for the want of not having been earthed-up after planting. The seedling Briar is quite as easy to bud as the

Manetti stock; it requires no pruning, except a slight root-pruning when planted.

The Briars are best planted with a dibber, and in rows about

10 to 12 inches apart, flush to the surface, and 30 inches between the rows, and then well earthed-up like Potatoes. They must be kept well earthed-up until the day one is ready to bud them; then carefully unearth them, taking the soil well away from the stock on each side close to the root. Clean the stocks from earth or damp before budding. Bud low, and bind the cotton well round so as to cover up every part of the incision made by the knife; leave the cotton on for three weeks before untying. Be very careful to keep the earth well away from the bud so as to keep the cotton dry, or the buds may probably damp-off. Allow the Briars to remain until the following spring, then cut-off to the eye the same as standards.

Good Briars are the most essential things you have to seek after, and I think it is very doubtful if they can be purchased at the low price mentioned.—J. Mayo, Corn Market Street, Oxford.

NOTES ON VILLA AND SUBURBAN GARDENING.

PERHAPS out of the whole year there is not a month which brings more important work with it than October. The garden ought to be thoroughly overhauled, and any alterations contemplated must be now planned; and in my opinion it is the best of all seasons for planting and root-pruning fruit trees, and, in fact, plants in general may now be safely transplanted. All evergreen shrubs may also be removed, especially those of large dimensions which have been previously prepared. It is a very good plan, where the soil is not well drained or is naturally heavy and wet, to dig out the holes some time before planting, and allow the soil to be exposed to the weather and become somewhat sweetened. Some gardeners insist upon this being done in every case, and as it is a step in the right direction good results may be expected from it. The holes should also be dug up at the bottom fully a foot more in depth than that at which the plant is to be placed, and in filling-in the soil the sides of the hole should be broken down. The principal advantage in this is that it allows the water to pass away, instead of holding it there in the form of a basin to the great injury to the plant; and again, when the roots reach the outside of the hole proper, there is no check to their taking hold of the fresh soil.

It is time now to finish the planting of Winter Greens and Coleworts; and, in fact, everything that has yet a little season before it, should be planted without delay. Earth-up the later crops of Celery at every opportunity during the month in fine weather, and take care in doing so that the earth is first broken up fine, and at every earthing the first lot of earth should be put round with the hand and pressed tightly, none being allowed to go into the heart of the plant, otherwise it will most likely cripple the latter, and by its holding moisture will cause decay. While the weather is mild Celery may be expected to continue growing, therefore do not throw the earth up too high, but at the last earthing it will not matter so much.

Take up the crops of Carrots, Beetroot, Salsafy, Scorzonera, and some of the Parsnips. Do not trim any of the former too closely at the crown, and with Beet the root should not be broken, or both colour and flavour leave it in the cooking. Asparagus beds must now be attended to by cutting off the summer's growth. Clear the beds, cover the roots or crowns with a little manure, and on the top of this put a little soil. Cut down the sides, and let them remain for the winter. Lettuces—plant-out as many as possible in every available corner, and means must be taken to place a quantity of them in frames for early spring planting; the same may be said of Cauliflowers, a few protected in frames are very handy if the winter should prove severe. Last winter, the weather being so mild, they stood remarkably well under walls without protection. Prepare places to receive the earliest crops of Endive, which may be taken up by the root with a little soil adhering to it and kept all the winter. The roots of the Broad-leaved Batavian and of Fraser's Broad-leaved, if preserved in winter and planted again in dry soil, throw up some fine, fresh, tender leaves, which, if blanched the same as Chicory, are very nice, and come in useful when the supply of salading is short. Gather the ripe fruit of Tomatoes, and that which is just begun to change may also be taken off, and if laid in the sun under cover for a few days it soon ripens. The wet cracks the fruit if hanging out of doors too long, and then it rots suddenly.

It is time now that all fruit were housed, therefore gather every sort, and in the most careful manner too, for the slightest bruise at this time tells upon the fruit hereafter, and affects its keeping properties. About here Apples are rather a short crop, and therefore every care must be taken not to spoil them. This month is the time when such tender trees as the Peach are much benefited by the sun in so far as the ripening of the wood goes; therefore any superfluous wood which will hinder the ripening process should be taken out, and that left to form the trees should be assisted towards the above object. I presume that since rain has fallen some of the trees are starting into growth

again; now this should be checked or removed, for it will do no good whatever.

Let us now look into the flower garden; and here I must remind everyone that it is time to take up all plants required for autumn decoration, and to have places prepared for the reception of other stock when the time comes. I allude to such things as old plants of bedding Geraniums which it is desired to preserve, and other things as well: all these may be potted-up with the view of keeping them in as close quarters as possible. In order to be safe with all sorts of pot plants that have been standing out of doors, and the autumn-struck bedding plants also, they should all be now placed under cover. When this is done let every plant be cleaned and the pots washed. Afterwards allow them plenty of air when the weather is favourable, and in order to make sure of health in the plants they should be fumigated with tobacco within a fortnight after admission. As I presume that all propagation except that of Calceolarias is finished, it will be time to prepare a frame for these. I would advise that, first, the frame have a foot of rough manure at the bottom pressed firmly, then 6 inches of common soil, and afterwards about the same of soil finely sifted, and a good quantity of sand mixed with it. Let the whole be thick enough to bring the soil up to within 8 or 9 inches of the glass; level it down, and beat it firm. In this place the cuttings in rows 3 inches apart, water them afterwards, and keep the lights close; and although the cuttings do enjoy the light, they must on no account be allowed to flag from the force of the sun; the object should be to keep the cuttings as fresh as possible, and therefore it will do them good to be occasionally sprinkled with water. After they are rooted air must be given freely; for they ought not to grow much during the dull days of winter. They must be protected from frost, and therefore material for that purpose should be prepared. Doubtless before next month is out the frame will require to be protected round the sides by a lining of leaves or any other rough rubbish to keep out the frost. Herbaceous Calceolarias and Cinerarias must be potted this month; the latter will, no doubt, take their blooming pots, but the former will require another shift or two in November, as they grow very fast at this time of year. Prepare soil for Hyacinths, Tulips, &c., of which next week I will give a list of a few good varieties.—T. RECORD.

DOINGS OF THE LAST AND PRESENT WEEKS.

KITCHEN AND FRUIT GARDEN.

THE season is now upon us when we are driven to our wits' end to continue a supply of the choicer description of vegetables. As usual the later-sown Peas did badly, and this can only be accounted for by the nature of the soil. Light soil on a gravelly subsoil does not suit any crops of vegetables, and Peas succumb to the nature of the soil more readily than any other crop, with the exception of Broccoli, which refuses to grow under any circumstances. It is almost enough to make one envious to see the fine crops of Peas this month in Scotland; but then the soil is rich, well worked, and resting on a clay subsoil. A very little mildew only was present on the plants. The varieties that looked remarkably well were Veitch's Perfection and Bishop's Dwarf. One would have thought that the last-named variety would have been elbowed out of existence by the new introductions. Not so, however: it still boldly held its own against such a fine variety as Perfection. When sowing for the latest crops it is always best to sow the early and late varieties at the same time. It is likewise important to allow sufficient space between the rows, not less than 4 feet—4½ feet would be better—and let the rows run north and south. We remove Cauliflowers to a dark shed as they are ready for use. They will not keep long in a condition for the table under any circumstances. We have stripped the outer leaves off, and cut the others close over with the top of the head; the stalks were left long enough to be inserted to the depth of 3 or 4 inches in damp sand. The other method, which is preferable, is to strip a few of the outer leaves and hang up with the heads downwards. The heads not yet sufficiently advanced to use have the leaves bent or broken over them.

We still under all favourable circumstances keep the hoe at work amongst all growing crops, not only because the weeds grow like magic, but because all vegetables are much benefited by the ground being frequently stirred amongst them, even more so at this season than at any other. Forwarding digging and trenching. It is well to let the ground be thrown up to expose it to the action of the atmosphere; and how much more tidy a garden looks in the winter, when the quarters are all dug, than when they are left as the crops were taken from them and also partly covered with weeds!

GREENHOUSE AND CONSERVATORY.

Removing *Chrysanthemums* into the house. Last year the buds were touched with a rather sharp frost that we had in the first week in October, and the result was a large proportion of malformed flowers on the plants that were grown for exhibition, and the outer petals of many of them were killed outright. Where it is intended to grow flowers for exhibition it is quite

as well not to have too many on one plant. We usually grow two or three plants in one pot, and from three to six flowers on a plant, according to the variety. Some sorts have not the least tendency to become coarse, grow them as strongly as it is possible to grow them. Of this class may be named Antonelli, Mrs. Rundle, Little Harry, Little Pet, Her Majesty, Lady Talford, and all small and medium-sized flowers. Not all the large flowers have a tendency to become coarse; Princess Teck, Pink Perfection, and others of that class, are never coarse. Queen of England, Prince Alfred, Jardin des Plantes, and more especially the Bronze variety of it, White Globe, &c., should be allowed to carry six flowers on a plant. In this, however, as well as setting the buds, experience is the best teacher. For instance, the buds of such sorts as Princess of Wales and Princess Teck should be set about the last week of August or the first week of September; whereas such varieties as Mrs. G. Rundle may be set two weeks later. In tying into position the growths of such Pompon varieties as are intended to make specimen plants, do not tie in closely, which causes the plants to assume an unnatural appearance. Pyramid-trained plants look well, but are not quite so effective as those trained in the bush form. A few standards placed amongst the others serve to brighten the effect. The specimens of the large-flowering varieties will not require any training until the flowers are well advanced, when each flower will require to be trained separately to a neat stick. It has been necessary to dust the plants occasionally for mildew with flowers of sulphur, driving the dust underneath the plants with an appliance made for the purpose.

A few days ago, when writing of the Camellias, it was advised to place some of the plants early in heat and keep them there until the buds were well formed. Such plants will be opening their flower buds now, and will continue to do so for four months. Of course the plants are large. Those plants that have not been forced in any way will just succeed them. Tree Carnations have also been removed from out of doors into the house; the plants tied-up to the sticks and cleaved from green fly. The secret of success in the culture of the Tree Carnations is to pot in good loam, leaf mould, and a little rotted manure. The plants must be kept free from green fly, and should be placed near the glass in a temperature of 50° for a minimum; a rather dry atmosphere suits them best.

Potting the earliest Tulips and Hyacinths; this should have been done early in September if the plants were wanted in flower about Christmas. All those intended for early flowering should be potted in 5-inch pots, and plunged out of doors in some light material free from worms—spent tan, cocoa-nut fibre refuse, leaf mould, or sawdust from any hard-wooded trees. Coal ashes, which have sometimes been recommended, will oftentimes injure the crowns when they begin to push. Potting Roses, some of them being large specimens; others which are new varieties are smaller. The large specimens are potted in the same sized pots after reducing the ball of earth sufficiently to allow of an inch or 1½ inch of fresh compost all round between the roots and the sides of the pot; good turfy loam with a small portion of crushed bones and a little rotted manure is well adapted for them. Smaller plants are potted in a size-larger pot from that in which they had been previously. Ram the compost in pretty firmly, and plunge the pots out of doors the same way as that recommended for Hyacinths. Tea Roses should be kept under glass, as they will not succeed if they are drenched by the autumn rains. Double Italian Tuberoses are also showing flower, and are a very nice feature in the furnishing of the greenhouse at this season. We pot these much in the same way as Hyacinths, and start them into growth in the early summer months by placing the pots in a frame in a gentle bottom heat. Red spider is the inveterate enemy of this plant; it attacks the leaves furiously, and will soon cause the whole plant to look sickly if not washed off.

FLOWER GARDEN.

It is now quite time that all cuttings of zonal Pelargoniums and other such bedding plants as were struck out of doors in boxes were placed in their winter quarters. Even if they are not liable to be destroyed by frost, it is not desirable to have the soil in which they are growing soaked with rain. We have put in all cuttings of such bedding plants as Verbenas, Heliotropes, Lobelia, &c. Calceolarias will be in good time about the end of the present month. Lobelia speciosa is invaluable as a blue bedding plant, and is most readily propagated from seeds, a superior stock being kept up by saving seeds only from the best coloured and best habited plants. It is not yet too late to sow the seeds, though ours were put in about three weeks ago. The double blue variety of *L. speciosa* has been much lauded by a few, and as resolutely condemned by the many. It is certainly not to be depended upon to flower as freely as the single sort. Old plants flower well; spring-struck cuttings have made a miserable figure. No doubt if it would flower as freely as the single sorts it would be a very useful plant. Messrs. Downie, Laird, and Laing have a very fine free-flowering variety at present in their winter garden; it is named Lady McDonald. The flowers

are very large, and said to be almost white in the summer months; at present they are creamy white, edged and suffused with corselean blue.—J. DOUGLAS.

PROVINCIAL HORTICULTURAL EXHIBITIONS.

[SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held. Although we cannot report them fully, we shall readily note anything especially excellent, and we wish for information on such specialities to be sent to us.]

TRADE CATALOGUES RECEIVED.

William Paul, Waltham Cross, London, N.—*Rose Catalogue*.
Louis Van Houtte, Ghent, Belgium.—*Catalogue of Azalea indica, Rhododendrons, Hardy Azaleas, &c.*

Davidson & Whitten, White Cross Nurseries, Hereford.—*Catalogue of Selected Roses*.—*Catalogue of Shrubs, Fruit and Forest Trees*.

Groux et Fils, Vallée d'Aulnay, Sceaux (Seine).—*Prix Courant des Arbres Fruitières, Arbres et Arbustes d'Ornement, &c.*

TO CORRESPONDENTS.

* * It is particularly requested that no communication be addressed *privately* to either of the Editors of this Journal. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only.

We also request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

POTATOES (*T. P., Canterbury*).—There will be collections of Potatoes at the Royal Horticultural Society's Show on November 11th, also at the Cattle Show.

VARIEGATED PLANTAIN (*An Old Subscriber*).—This is a very pretty variegated form of *Plantago major*, and is not at all common, though we have seen it before. If you can get enough of it no doubt it will make a good permanent edging. Do not risk the whole of the plants exposed all the winter, for we once found a beautifully variegated plant of *P. lanceolata*, and thinking it would be perfectly hardy left it out in the open ground, and it perished by the frost. We hope you will have better success. The Forget-me-not is *Myosotis dissitiflora*.

IRENE LINDEN LOSING ITS LEAVES (*A. W.*).—The leaves fell owing to the plants being kept in too cold an atmosphere, and not being well established before winter. To winter fresh they require a temperature of not less than 50°, doing better in one of 55° to 60° at night. In a low temperature they should not have more water than sufficient to keep them fresh, introducing them to heat in spring. Alternantheras can be wintered in a lower temperature than Irene, but not much less than 47°, watering carefully and only as required to keep the plants from shrivelling. They are also the better of heat in spring.

EDGING PLANTS (*Diligent Reader*).—*Santolina incana* and *S. Chamæcyparissus* are not identical. *S. incana* we consider the better for edgings, but both are good. Golden Feather Pyrethrum is better as a golden edging plant than *Arabis lucida variegata*, which does not grow freely nor is so certain as could be wished, but *Stellaria graminea aurea* is more effective than the Golden Pyrethrum; both, however, are excellent. *Dactylis glomerata elegans* differs from *D. glomerata variegata* in being of dwarfier and flatter growth, the latter being strong in growth and subject to become green or lose its variegation. In well-drained light sandy soil it is perfect ly hardy, but in wet heavy soil it is not so, the plants dying off. Dell's Crimson Beet is the dwarfest and best.

WINTERING SEEDLING CINERARIAS (*An Amateur of One Year's Standing*).—The seedling Cinerarias may be wintered in a pit or other place where they are near the glass and safe from frost. They cannot be wintered in a house from which frost is not excluded. They ought to have a temperature of 40° to 45° from fire heat so as to keep them slowly growing. A moist air freely.

CAMELLIA BUDS IN CLUSTERS (*Idem*).—Your Camellias with the buds in large bunches or clusters of seven to ten should be reduced to at most three on a shoot. Reduce the number at once, but gradually at intervals of a few days, removing the smallest first, and carefully, so as not to dislocate the remaining buds.

CAMELLIA BUDS THINNING (*Anxious to Learn*).—Thin the buds to two or three on a shoot, removing the smallest buds. Weak shoots ought not to be allowed more than one bud. The flowers will be larger than were you to leave all the buds, and the plants will grow more vigorously another season. If all are left they would be small; probably a great many would fall, often most. The centre stage will be the most suitable place for them, also for Azaleas. *Cobaea scandens* should not be cut down now, but have only water to keep it fresh, and be pruned in February or March.

HYACINTHS IN GLASSES (*A Lady Amateur*).—Place the bulbs in the glasses after filling the latter with soft water so that the base of the bulb just or barely touches it, always keeping the water to that level, and removing it whenever it becomes impure, as may be known by the ends of the roots looking woolly; then replace with fresh which has been kept overnight in the room with the plants to acquire the same temperature. To keep the water longer sweet, a piece of charcoal about the size of a small walnut may be placed in each glass. Set the glasses in a cool and dark cupboard until the roots have formed, but remove them to the light before the crown has grown an inch, and then give air daily if mild weather, but do not stand the glasses on stone, brick, or iron, but on wood. The plants may be sprinkled overhead every day with rain water until they come into flower, which greatly invigorates them. Avoid frost, wind, and a close room, and keep them off the mantelshelf. A window is the best place. October is the best time to place the bulbs in the glasses.

AUGA REPTANS PURPUREA PROPAGATION (*C. P. R.*).—It has dark purple bronze foliage, and forms a good contrast to Golden Feather Pyrethrum, and is best in spring, being very valuable for spring bedding. It is propagated by cuttings of two joints and the growing point inserted in sandy soil, kept moist, and shaded from sun; or they may in summer, or even now, be put in on a north border, but would root at this season more freely in a frame. Plants for spring bedding ought to be struck early in summer, and should be nice plants by autumn. It is perfectly hardy.

GARDENIA RADICANS IN WINTER (*A Young Gardener*).—The soil should be kept moist through the winter, but the plant needs much less water at that season than when growing freely; enough, however, should be given to keep the foliage from flagging. Being in a warm house, you will not need to place the plant in extra heat to produce flowers now and in succession. It is a stove plant. You would gain nothing by placing it in greater heat, though you would certainly insure the expansion of the larger buds, and the remaining buds would be needlessly excited. Keep it, therefore, in a temperature of 60° to 65°. An increase of heat in spring, with bottom heat and a moist atmosphere, would be advantageous.

EMPHYLLUM CULTURE (*Idem*).—They should have enough water to keep the soil moist, but not sodden, and after flowering they should have no more than sufficient to keep the stems plump until they are started into growth in spring, then water freely and keep moist. They will flower well in a temperature of 45°, but may be forwarded in a stove. The flowers endure longer in a greenhouse than in a stove. A greenhouse is most suitable for them, with extra heat when making new growth.

SENSITIVE PLANT IN SITTING-ROOM WINDOW (*Miss Cattle*).—You have begun at the wrong end of the year, the Sensitive Plant being an annual. It is not likely that you will in a sitting-room window succeed in wintering the plants, but you may pot them off singly in 3-inch pots at once, draining well, using a compost of sandy loam, leaf soil, and sandy peat in equal parts, with a sixth of silver sand. Water very carefully, giving only enough to keep the plants fresh. It is possible they may survive the winter, and if so, you may shift them into 6-inch pots when they have filled the 3-inch pots with roots; water more freely as the growth progresses, and abundantly when growing freely. It would have been better had the seed been sown in a hotbed in spring, the plants potted off when about an inch high and returned to the hotbed, shifting into 6-inch pots when the 3-inch pots were full of roots, not removing them to the sitting-room until the plants were well established in the 6-inch pots.

CAMELLIA BUDS NOT OPENING (*Wordsley*).—The Camellia buds you sent us are in no way imperfect, the bud being hollow in the centre solely in consequence of the outer petals being more advanced than the central and smaller ones. The flowers would probably open more freely in a higher temperature, say of 55° from fire heat. Give them time.

WINTERING BEDDING GERANIUMS (*E. R. M.*).—You do not say what convenience you have for wintering them, therefore we may not meet your case by our reply. Take up the plants early in this month, or after the first frost which cuts off or blackens the buds, and strip off all the large leaves—in fact, all the leaves that are larger than a shilling. Cut back any straggling about to a young one, trim the roots a little and pot singly in 4-inch pots, or such a size as will hold the tubers, using sandy fibrous loam with a third of leaf soil and a sixth of sand. Place in a light airy position in a house with a temperature from fire heat of 40° to 45°, and water to keep the soil just moist, and when they are growing freely water more copiously. Any irregularities of growth may be removed by cutting-in the plants in March, and if put into 6-inch pots then they will be strong by May.

PROPAGATING ZONAL GERANIUMS (*Beginner*).—Shift the plants at once into 4-inch pots, and place them on a shelf about 18 inches from the glass in the Cucurbit house. When they have taken to the fresh soil they may probably have shoots for cuttings. If they have, insert the shoots singly in small pots, and strike them in bottom heat. They will soon root, but be careful not to keep them too moist, otherwise they may damp. The parent plants should be well but not excessively watered, and when the pots fill with roots shift into 6-inch pots, and on becoming again established examine them for cuttings, and shift into larger pots. When you can get a cutting with two joints and the growing point, leaving three joints on the plant for future growth, take off the cutting. This remark applies to the old as well as young plants, and by following this treatment through the winter, shifting the plants into larger pots as the growth requires, and taking cuttings as they present themselves, you will have a number of good plants by May. Cuttings may be taken up to the close of March, or even early in April. Do not overpot, nor, on the other hand, allow them to become pot-bound, and water carefully.

EDGING PLANTS FOR BORDER ON LAWN (*M. H. M.*).—For a permanent edging to a border on grass, Ivies of the green kinds would not be suitable, as they would not contrast unless you had the border raised, and then they would answer admirably. The small-leaved kinds are most suitable, as *Hedera Donoliensis* and *H. taurica*. The best silver is *H. Helix elegans*. *H. Helix folio-variegata* is also good. The edging may be raised with stones, over which the Ivies will run and cling to, and soon form a close edging. The *Euonymus radicans variegatus*, with green leaves broadly margined with white or silver, is excellent for edging; *E. flavescentis*, with leaves of a deep chrome yellow, is also good, and might with cutting be kept to the height you require, it being of free growth, but compact. The variegated *Thymes* are desirable edging plants: one variegated yellow, *Thymus citriodorus aureo-margitatus*; and the other white, *T. variegatus*.

EVERGREEN SCREENS FOR SHELTER (*Idem*).—Ivy screens are not equal to those of Yew, Holly, or Landri. For an outer screen Beech and Hornbeam, also Thorn hedges are better, because quicker-growing than Holly or Yew,

which are excellent nevertheless. Evergreen Privet is also good as a screen, and quick-growing. *Arbutus* is desirable as a screen for separating grounds; but the best evergreens are Yew, Holly, and Privet, and the Beech and Thorn among deciduous trees. If you had Ivy you would need a strong rustic fence or larch stakes for the Ivy to cling to, and when the woodwork decayed, as it would do in a few years, the wind would blow it down, and the Ivy along with it.

FERN FOR STAND IN NORTH WINDOW (*L. C.*).—It is not possible to determine the name of a Fern from a single division of the fronds, but we think it is *Cyrtomium falcatum*, which is nearly if not quite hardy, and as such would be suitable for a stand in a north window. *Asplenium flabellifolium* is a charming small Fern for suspending in glass cases, but in the position you name it would not succeed in winter. It requires to be kept from frost.

ELECTION OF ROSES (*Amateur, South of Ireland*).—On referring to this week's number, and the preceding two, you will see how Mr. Hinton has carried out the election and its results.

BOXES FOR EXHIBITING ROSES (*E. F. W.*).—The following are the dimensions of the boxes for exhibiting Roses:—

	Length.	Breadth.	Height.
For 24 Roses ..	4 ft. ..	1 ft 6 ins. ..	6 ins. back, 4 ins. front.
" 18 ..	3 ft. ..	" ditto ..	" ditto
" 12 ..	2 ft. 2 ins. ..	" ditto ..	" ditto
" 6 ..	1 ft. 6 ins. ..	" ditto ..	" ditto

Two 24-boxes are constantly used for exhibiting forty-eight trusses, and could not be objected to unless one box were specified in the schedule.

YELLOW ROSE (*M. H. B.*).—The petals fell when the box was opened; but from the shape of the petals, scent, and foliage, we think it is the old Tea *Sulphurea odorata*, sometimes called *Crystallina*.

PLANTING ROSES ON OWN ROOTS (*Idem*).—As soon as received they should have all weak growths pruned short to two or three eyes, and the stronger shortened to five or six. Cloth of Gold and Marchal Niel on Briar stocks should have weakly shoots cut out altogether, and all strong ones trained in to full length. The above are to be trained against a wall. Of vigorous climbers to be similarly trained, shorten the very strongest growths slightly. *Blairi No. 2* does not endure cutting. *Gloire de Dijon* and *Devoniensis* may be shortened more, but as a rule fasten plenty of wood in, and encourage strong growth.

VINES AGAINST END OF HOUSE (*F. I.*).—Plant the Vines a yard apart 18 inches from each end, and the rods we should take upright, and cut them back to 3 feet, depressing the canes in spring so as to ensure their eyes breaking regularly. When these have broken disbud so as to leave the shoots at 18 inches apart on both sides of the rod, taking the first at about 1 foot from the soil. You will require to retain one shoot as a leader in addition to the side shoots. Vines trained upright always break much more strongly at top than bottom, hence it is good practice to train the rods in the serpentine form, and originate the shoots from the horizontal parts at 18 inches apart, that distance being left between one curve and the other next above it.

GRAPES DISEASED (*R. S.*).—The centre stalk of each bunch is severely shanked. Apply tepid weak manure water copiously to the roots of the Vines bearing the shanked bunches. It will not cure them, but it will check other bunches being affected. Remove the soil of the border in the autumn, and replace it with good loam mixed with leaf mould and limy rubbish. (*Green*).—The above applies to your case; try the treatment we have recommended, and spare the Vine another year.

GRAPES CRACKING (*E. M. Dublin*).—They are severely mildewed, and that induced cracking. The berries are small, and indicate that the soil is not suitable. When the crop is off and the leaves fallen the whole house and Vines should be thoroughly painted with a mixture of lime and flowers of sulphur, and the border enriched with a mixture of decayed leaves and limy rubbish.

QUINCE UNFRUITFUL (*Juliah*).—We fear that the cause of the small production of your tree is frost in spring; and if the sun shone early in the day on the blossom after a frosty night, the sunny situation would increase instead of diminishing the injury. The quince thrives best in a somewhat strong and rather moist soil, and moisture at the roots would benefit it in your ground.

PLYM TREES UNFRUITFUL (*Amateur*).—The trees would be best lifted as soon as the leaves turn yellow and begin to fall. Take out a trench about 3 feet from the stem, cutting off all roots, and lift the trees with the roots in the space towards the stem, cutting off any roots that go down. After putting some soil under, replace the tree and fill up, treading the ground firmly. The trees should be kept rather high, the uppermost roots about 6 inches above the surrounding ground level, and cover them about 3 inches deep with fresh soil, making firm, and mulching over the roots with littery manure. It is not desirable to defer the pruning until spring with a view to protect the blossom from frost. If summer pruning were properly attended to, very little winter pruning would be required.

PLANTING SHALLOTS (*Idem*).—In a light soil you may plant Shallots in November and cover them with a-bes, which keep them from being acted on by frost. If the soil is heavy, February planting is preferable.

RED CURRANTS (*Idem*).—A selection of six will almost include the whole of the varieties of Currant:—Houghton Castle or Victoria is the best, but rather late; *La Hative* is very fine and early; *La Versailles*, being excellent. These will give you all you want; but to make six—Red Dutch, Cherry, and Knight's Large.

SPLITTING THE STEM OF MOORPARK APRICOT (*H. S. N.*).—By making an incision through the bark down to the wood and the length of the stem you would probably cause gum to issue, and disease of the heart to set in. What your tree wants is more support, which you may afford by copious waterings of liquid manure during growth. From the gravel path it is likely the soil is dry and poor. To allow of water entering, holes may be made in the walk about 9 inches apart, and through the gravel with a crowbar. Guano, 1 lb. to twenty gallons of water, would be a good application every fortnight in dry weather, from the time the fruit is the size of a horse bean until it is ripe.

FUNGUSES (*L. E., Diss.*).—The long-stalked fungus enclosed is the *Cham-pignon*, and edible; the other specimen was a mere decomposing mass not recognisable. (*G. S.*).—If it was left under your initials we are afraid we never received it.

GROUND BARE BENEATH CEDAR TREE (*Peter*).—We presume it is a Cedar of Lebanon, and has a considerable spread of branches, which causes the grass not to grow, the ground being poor and dry. Any growth other than

grass would spoil its appearance, and as grass does not grow it would be too dry for Ivy, unless it were planted outside the spread of the branches, so that its roots would have moisture, the shoots being trained inwards. *Vine* minor, if planted about a foot apart, would give you a close green covering, and would not injure the tree if care were taken in planting. We should make another effort to secure grass. Loosen the surface with a fork now, not deeply—an inch or two will do—give a top-dressing an inch thick of rich compost, and sow over it *Poa nemoralis* sempervirens and *Festuca duranensis* rather thickly. Sow at once, roll well, and after rolling water thoroughly through a rose watering-pot. We think you will have a green surface soon.

GARDEN SHORT OF MANURE (S. B.).—Salt would not be a bad application in spring, sowing the whole garden over in March at the rate of twenty bushels per acre. Nitrate of soda is also good; apply it at the rate of 1 lb. per square rod—3¼ square yards. It may also be applied in a liquid state, and at the rate of 1 lb. to twelve gallons of water. Guano is also very serviceable, applying 2 to 3 lbs. per rod, or if in a liquid state 1 lb. to twenty gallons of water. We cannot recommend dealers, but you will see where such things may be had from our advertising column. Solid manure, especially cow dung, would be much more serviceable for your soil than those named.

SEWAGE (H. L. E.).—Sewery drainage is worth preserving, and may be applied to kitchen-garden crops at any time of their growth. The name of the Pear is mis-spelt; it is *Doyenne d'Eté*. Dr. Hogg's "Fruit Manual" says it is "a most delicious Pear; one of the best; ripe in December."

HOT-WATER PIPES (E. W.).—Your two 3-inch pipes the length of the house and across one end, or part of the end, would give you in a house 10 feet wide and 7 feet high in the centre, a temperature of 45° to 50° in frosty weather, and not much less in severe weather, the pipes being kept hot. In the most severe weather they will be ample to exclude frost.

PIPING TO HEAT STOVE (A Devonshire Subscriber).—To heat your stove satisfactorily you will require four rows of 4-inch piping—i.e., two flow and two return pipes along both sides and the ends, or omitting 4 feet for each doorway, you will require about 384 feet; and to heat the water you will need a boiler, taking an improved form of saddle in preference to the old one (such being more powerful and economical of fuel, 24 inches long, or the work would be done better by one of 20 inches and 18 inches wide).

HEATING GREENHOUSE (Biceps).—A gas stove would be practically useless in a house the length of yours, and a stove without a flue would be very injurious to plants. A gas-heated boiler placed at one end, and with a funnel to carry off the fumes of the burning gas, which should pass into the external air, and with two 1-inch pipes along one side of the house, and the same number returning to the boiler—viz., two flow and two return 1-inch pipes, would give you all the heat you require to keep out frost. You would need to write to those advertising in our columns, stating what length of piping you would need, and asking for price of boiler to heat, or they would probably state price of the apparatus complete. Your house getting little sun would be admirably suited for *Camellias*, especially the wall, if you could have a border to plant them in, or both walls could be covered with them. The slight in winter would be grand.

THRIPS ON MYRTLES AND OTHER PLANTS (A. S. B.).—The leaves were destroyed by thrips, which you will find especially on the under surface of the leaves. The best remedy for the Myrtles would be to sponge the leaves and stems with soft soap, 4 ozs. to the gallon of water, and all other smooth-leaved plants may be treated in the same way; but those with soft and hairy leaves, as *Geraniums* and *Ferns*, should not be sponged in this way, but may be dipped in tobacco water, one gallon of tobacco juice being diluted with six of water. Plants so badly infested as yours are will lose their leaves. In the course of a fortnight after the application examine the plants, and if any insects are seen fill the house with tobacco smoke so that a plant cannot be seen from the outside, shutting up closely. Being a conservatory it is likely the fumigation may be objectionable, therefore employ the soap solution and the tobacco water, syringing the plants about three hours after the application on the under as well as the upper surface of the leaves. To keep thrips down in future maintain a moist atmosphere, syringing morning and evening in summer, and occasionally in winter.

NAMES OF FRUITS (T. F.).—1, *Souvenir du Congrès*; 2, *Beurre Superfin*. (*A Fruit-Grower*).—1, *Bleheim Pippin*; 2, *Franklin's Golden Pippin*; 3, *Trumpington*. (*W. J. S.*).—1, *Bonne D'Inde*; 2, *Verulam*; 3, *Beurre Bosc*; 4, *Corish Gilliflower*; 5, *Calville Mahague*. (*P. Q.*).—Your Pear is not *Grey Doyenne*, but *Fondante d'Automne*.

NAMES OF PLANTS (H. H. W.).—The tiny plant you sent was shrivelled and dry. It was impossible to make anything of it. You should always wrap specimens in damp material. (*Co. Antrim*).—1, *Fraxinea ramosa*, *Hook.*; 2, *Nepeta mollisefolia*. (*L. E. P.*)—*Tecoma Marum*, *L.* (*C. B. Marsden*).—*Cassia Sophora*, *L. No.* (*New Forest*).—*Polygonum multiflorum*. (*J. G.*).—*Nicotiana glauca* or *N. Langsdorffii*, specimen very bad. (*E. J.*).—1, *Pteris caerulea alb-fluata*; 2, *P. tremula*; 3, *P. heterophylla*; 4, *Asplenium angulare*; 5, *Asplenium obtusatum*; 6, *Blechnum* or *Lomaria* sp. (*T. B. G.*).—1, *Asplenium (Dore)* *Bolangeri*; 2, *Gymnogramma tartarea*; 5, *G. chrysophylla*; 6, *G. cal melanos*; 3, *Pteris arguta*? 4, *P. tremula*. (*J. C.*).—1, *Cystopteris fragilis*; 2, *Polypodium (Phymatodes) scandens* or a near ally; 3, *Davallia novae-zelandiae*.

POULTRY, BEE, AND PIGEON CHRONICLE.

ALTRINCHAM POULTRY SHOW.

This was a complete success as regards the number of entries, the weather, and the attendance of visitors. The pens used for the poultry were square wooden coops with wire fronts, but we regret to have to record the fact that we saw neither food nor water given to the birds, except by those exhibitors who attended to their own stock; and the Show lasting two days, we fear that many birds would arrive at home in an awful plight.

Turkeys and aquatic birds headed the list, Mr. Walker winning nine prizes in four classes, and being beaten for first only in the case of the *Aylesbury Ducks*, and here only with a most extraordinary pen. Of *Spanish* there were but four entries for six prizes, and the birds nothing of note. In *Black Red Game* cockerels Mr. Platt won with a good bird, the second being good

but sadly oversown, and the third very poor. The three winning pullets were also very good. The first in *Brown Red* cockerels was a bird with a combination of good qualities, which it is difficult to get in individual specimens; a very dark, long, strong head and black eye combined with the finest plumage. Second was the *Farnworth* cup bird, and the third of but moderate quality. The pullets were of rare quality. In the next a *Pile* cockerel was first, a moderate *Duckwing* second, and a good *Pile* third; while the only other bird was a *White* one, value 2s. 6d., but which served to set off the quality of the rest. In pullets the first *Duckwing*, rather light on the breast, was otherwise good; the third, *Pile*, much too light, while the second was good. *Dorking* cockerels were good, except the third, which had not good feet; and the pullets were poor. *Cochin*, *Buff* and *Cinnamon*—(by the way, where are the *Cinnamon* now?)—cockerels produced some grand birds, the champions only competing; but in pullets the entries were more numerous, Mr. Crabtree here also taking both first and second prizes, the third, however, being in our opinion too meanly. In the following cockerel class *Partridge* won the prizes, and in pullets *Partridge* were first and second, and *White* third.

The entries in *Brahmas* were very good. In cockerels Mr. Lingwood was to the front; the second-prize bird, a very good one, was in the catalogue at £5 5s. only; while in pullets Mr. Watts was first, but we thought Mr. Walker's second quite equal, to say the least. *Hamburgs* were mixed classes, and the competition only poor in consequence. In the class for *French* fowls, cockerels, all the winners were *Houdans*, as also in the pullets, which were very good. In *Polands* the first and second were *Golden*, and third *White-crested Blacks*, all being good. *Game Bantams* made a grand display, the quality being very high indeed; and it is seldom we see so many birds noticed in a section, the *Black Red* cockerels being all noticed, the first a grand bird in all points, second very small, and third of rare colour and style. In pullets of that variety Mr. Hall showed a beautiful specimen. The third was really good, but we thought the highly commended bird superior to the second. Two classes were provided for *Brown Reds*, the first and second cockerels being perfect; the third, a very stylish bird, was rather light in colour. In pullets Mr. Hartley showed three grand birds, winning the first and second prizes and a high commendation. The third was grand in all points except the head, which was rather short. In Any other variety of cockerels a small neat *Duckwing* was first, a good *Pile* second, and a very handsome *Duckwing* third; and in pullets Mr. Hall showed a *Pile* of great beauty, a *Duckwing* of rare colour being second, a *Pile* also being third. A cup for the best pen of *Bantams* of Any other variety was won by a fine laced pen of the old colour of *Silver Sebrights*, the second and third being *Black*.

Pigeons were a capital collection, shown partly in bell-shaped and partly in square wooden coops; the cup for the first seven classes going to a *Dan Carrier*, and the cup going to capital *English Owls*, the awards being generally well made.

There was a small show of *Rabbits*, but we failed to get particulars of the measurements.

We published the prize list last week.

AYLESBURY POULTRY SHOW.

(From a Correspondent.)

This Show was held on September 23rd in the Meat Market, a building most admirably suited for a show, it being roomy, well ventilated, and brilliantly light. The pens were *Billet's*, and they were ranged round the whole building, and placed on the same level, consequently all the birds could be most beautifully seen. The attendance was good, and the cards were quickly put up. Mr. Hewitt judged. It was a Show everyone could enjoy, for all the attendants were courteous; and Mr. Fowler, whose name is a household word in all poultry matters, here in his own town was most hospitable. We should have liked to have seen more entries, and a double tier of pens consequently necessary; but there were four more shows being held at other places, and no one can be at more than one place at once.

We have always been taught our old friends the *Dorkings* came first, and very good they were. The cup cock was simply superb; he had mounted-out as clean as possible, and was in grand condition. The pullet with him was also good. The second-prize birds were chickens; the cockerel very dark, but his comb was not very good, still he looked well in the pen and stood like a man. His pullet was a nice one, though she looked a little set. The third went to most exquisite *Silver-Greys*; the cockerel quite superb in colour and legs, the pullet very large, and promising to be a tremendous hen. A fair pen of *Whites* (*William*) were highly commended. *Brahmas* came next, *Dark* and *Light* together. Next year, Mr. Fell, you must separate these varieties. *Darks* won the cup. These were in glorious condition, and so young, yet they were immense for their age. The pullet was of lovely colour, she was grandly pencilled, and her comb very good; the cockerel honestly was

rather too mottled on the breast and thighs to please us, and we think the pullet won the cup; but they were a lovely pen, and we liked them on the whole extremely. The second-prize cockerel was a nice bird, but the pullet too light; had she been well pencilled this pair would have run the first-prize pen closely for the cup. A good pen or two of Lights were highly commended. *Spanish* were a very fair lot—nine pens. A good pen of old birds won the cup; second and third were chickens. The cockerel in the latter pen was good, and will be better still every week if he go on as he has done since we saw him last. The *Cochin* classes were wonderful—Buffs, Partridge, and White. We mentioned in a former report that Stoke Park had some good birds coming out, and we were not wrong. Lady Gwydyr won the cup with a capital pair. They were not so large as those she won the Aylesbury cup with last year, but then they were not so old. The pullet was of exquisite colour and of fine shape; the cockerel good in all respects. The second and third should, we think, have changed places; the third were also of such fine colour and shape. The second were old birds; the hen did not look very fresh; the cock a good bird. Mrs. Tindal had two nice pens highly commended, but they were old cocks, and not well through the moult. Partridge Cochins were admirable. The first-prize pen of chickens were of fine colour and good shape; the second were only fair, the cockerel best; the third went to huge undeveloped chickens. The cockerel must make an immense bird, and one which will win. White Cochins were a large class. Mr. Woodgate cleared the prizes with three pens of chickens, good in combs and colour. A pen of old birds of Mr. Bloodworth were good, and Mrs. Tindal had a nice very young pair of chickens. *Game* were all in one class. A very good pair of Black Red chickens won the cup; second good Brown Reds; the third were Duckwings. The cockerel in this pen was of splendid colour; he wants dubbing, and then will want a lot of beating. *French* mustered well. *Crève* first; *La Flèche*, out of condition, second. A good pair of *Crève* chickens (Tindal) were most promising. *Hamburghs* were most creditable. The *Spangled* were much the best. So good were the second-prize Golden, that before the awards were up we asked the exhibitor to have us to tea, the pen seemed safe for the cup, which was a cream-jug in this instance; but Silvers won it, and this pen was placed second. Certainly the Silvers were very grand, and it must have been close. Third also good.

Bantams (*Game*) were numerous. We did not care for the first-prize pen; the cock's wings almost touched the floor of the pen, but the plumage was fair. Nice *Piles* were second; the third went to Duckwings; the hen good, the cock poor in colour. A good pen of Duckwings (Adams) seemed worthy of more than *h.c.* In the Variety Bantam class poor Pekins were first; the cock good in colour, but the hen very pale and dirty, and poorly feathered. Second, Silver-laced; these birds were genuine silver colour, and should, we thought, have been near first. Third, nice Gold-laced. Two good pens of Blacks (Leno and Mayo) were highly commended.

The *Ducks* were, of course, grand. Everyone expects to see something wonderful at Aylesbury in the Duck way, and they were not disappointed this year. We may safely say we never saw such a drake as the cup one was; the Duck, too, grand. Second immense also; third very large and good too. In Rouens Mr. Evans cleared the prizes with wonderful specimens, good in colour and size. In Variety Ducks *Vidnatas* won first; a nice pen; *Cayugas* second. We were indeed glad to see this useful hardy breed at last recognised; the colour bids fair to equal their East Indian—may we say?—relations. American breeds had a class and a cup; this went to a good pair of White Leghorns, Brown Leghorns taking second. We do not care for this colour, they look so common. A nice pair of Plymouth Rocks were highly commended. We hope societies will follow Aylesbury and imitate Oxford in giving these breeds a class.

Lastly, but not at all least, came the Variety class. We were amazed at Aylesbury, of all places, where Mr. Fowler grows his huge specimens, to find Turkeys and Geese in this refuge. It seems hard lines, too, for a Silky or a Poland to be side by side with a gander. This class was splendid. First went to Black *Hamburghs*; the hen in this pen was like a mirror, such lustre we never saw; we almost think this was the best hen in the Show. Second went to huge Geese; third to White *Silkie*s, the pullet with a splendid crest. Mr. Taylor's hens in his pens of *Polands* were quite pictures, but the cocks not sufficiently through the moult. A good pen of Black *Cochins* (Darby) was highly commended, the hen, which we have so often noticed before, a wonder. A Selling class ended the lot. Poor White *Cochins* were first, good *Aylesburys* second, and Silver *Polands* third. We hope next year the Show may be as good in quality and ten times better in quantity.

TEST FOR COLOURING MATTER IN WINE.—M. De Cherville gives the following test for the detection of false colouring matter in wine:—Pour into a glass a small quantity of the wine under examination, and dissolve in it a morsel of potassa. If there is no deposit, and if the wine takes a greenish tint, it has not been

artificially coloured. If a violet deposit be formed, the wine has been coloured with elder berries or mulberries. If the deposit is red, beetroot or peach wood has been used; and if violet red, logwood. If the sediment is violet blue, privet berries have been employed; and if a bright violet, litmus.—(*Medico-Pharmaceutical Abstract and Review*.)

THE POULTRY-KEEPER.—No. 22.

COCHIN-CHINA OR SHANGHAI.

PARTRIDGE VARIETY.—HEN.

THE hen of the Partridge variety is regularly marked with dashes of dark black, or mixed with grey, and on a buff ground more or less dark. Each feather has marks which, though different, are very analogous on each part.

The general appearance is a mixture of colours not separable at first sight, but the markings can be distinguished by examining each feather. The hackle feathers (*fig. 94*) are nearly covered

Fig. 94.—Hackle Feather.

Fig. 95.—Wing Covert Feather.

with black, occupying the middle part from one end to the other, and to which the borders of the feather form a buff edging. The hack feathers—those forming the tail coverts, those of the thighs and the breast, and those which surround the stern, are nearly similar (*fig. 96*). They have three dark-grey demicircular bands on a buff ground. They only vary slightly in the details or in the proportions, and the bands fade towards the fluffy part and towards the under parts of the body. The front feathers of the neck are buff and nearly whole-coloured; those of the abdomen, the sides, the inside of the thighs, and those of the feet are yellow, mingled with light grey. The covert

Fig. 96.—Thigh Feather.

feathers of the wings (fig. 95) have peculiar markings—two semi-elliptical bands nearly black on a buff ground. The large wing feathers (fig. 97), especially of its lower part, are not visible when the wing is closed; they are blackish brown, and in the

Fig. 97.—Large Wing Feather.

Fig. 98.—Large Tail Feather.

visible half marked like the rest of the plumage. The large tail feathers (fig. 98), though very dark, have the same characteristic marks.

MANUFACTORY'S POISONOUS SUBLIMATIONS.

THE *Irish Farmers' Gazette* states that "One of the most extraordinary cases of poisoning of cattle and poultry that have ever been known has taken place within the last few days at the hamlet of Swinford, near Bath. For many years a considerable business in metal-smelting has been carried on in the neighbourhood, and in the centre of the hamlet stands the lead mill of Messrs. Weston & Son, of Bristol. Within the past few months a sediment, resembling hoar frost, has been noticed to settle upon the land within a radius of a mile of the mill; but the nuisance has been more intense on the land closer to it. Messrs. Freeman, Taylor, and Davis have each lost scores of hens, Geese, Galenas, and Ducks from eating the grass and drinking the water in the neighbourhood, the deadly sediment having settled upon them. Mr. Davis has been the greatest loser, as, in addition to poultry, three of his most valuable cows have, he is satisfied, died from the same cause. In both the case of the poultry and the cattle the symptoms have been those of paralysis. The birds first lose the use of their wings and

legs, and the cattle are rendered unable to move, and after frothing at the mouth and lying, some in the greatest agony, become at times almost frantic, having by this time been reduced to a condition of the utmost attenuation. Mr. Davis has submitted the intestines of the fowls to Mr. Stoddart, the analyst for the county of Somerset, and his certificate states that there was sufficient arsenic in the intestines of each bird to kill a dozen fowls. Complaints have been made to the local sanitary authorities; but, after considering the matter, they have decided they are unable to interfere."

We think that no such decision can have been arrived at. If animals are killed by the exhalations, human health and life must be deteriorated. In other districts we know that deleterious exhalations have been removed by force of law.

NOTTINGHAM POULTRY SHOW.

This was held from the 2nd to the 6th inst., and was highly successful in point of entries, especially in the Pigeon classes, the total number amounting to considerably more than seven hundred. Annexed is the list of awards.

GAME (Black or Brown-breasted Reds).—Cock or Cockerel.—1, J. Chesters, Newark. 2, H. E. Martin, Souththorpe. 3, G. H. Fitzherbert, Sevenoaks. 4, H. Smith, Maiton. *vhe*, A. Cameron, Epworth, Rotherham. *he*, Earl of Loudoun, Donnington Park; A. Cameron; J. Chesters. *Hen or Pullet*.—1, Earl of Loudoun. 2, G. H. Fitzherbert. 3, J. Chesters. 4, H. Beldon, Bingley. *vhe*, W. E. Little, Chester; J. Lane, Burton-on-Trent; J. Chesters. *he*, Earl of Loudoun; H. E. Martin, Souththorpe; B. Cox, Moulton, Northampton.

GAME (Any other variety).—Cock or Cockerel.—1, E. Aykroyd, Ecclehill, Leeds. 2, H. E. Martin. 3, L. Lane. 4, E. Bell, Burton-on-Trent. *c*, B. Mallett, Balham. *Hen or Pullet*.—1, Wilson & Hodgson, Ilkworth. 2, E. Aykroyd. 3, G. H. Fitzherbert. 4, E. Bell. *vhe*, W. Smith, jun., Easthorpe. *he*, Fisher & Charnock, Ilkworth.

DONKIOS (Coloured).—Cock or Cockerel.—1 and 2, Mrs. Arkwright, Sutton Scarsdale. 3, M. Rames, Stirling. 4, G. Pounder, Kirby Moorside. *he*, W. H. Robson, Reepham, Lincoln. *c*, Rev. E. Bartrum, Berkhamstead. *Hen or Pullet*.—1, Lady A. B. Pierce, Bedale. 2, Rev. E. Bartrum. 3 and 4, Mrs. Arkwright. *he*, Mrs. Somerville, Chirk. *c*, J. H. Nicholls, Lostwithclie.

DONKIOS (Any other variety).—Cock or Cockerel.—1, W. Roe, jun., Newark. 2 and 4, Hon. Mrs. Colville, Sillington, Burton-on-Trent. 3, Withheld. *Hen or Pullet*.—1, G. Potter, jun., Trowel. 2, Withheld. 3, J. E. Piggin, Hincley. 4, W. Roe, jun., Newark.

COCHINS (Buff or Cinnamon).—Cock or Cockerel.—1, W. A. Burnell, Southwell. 2, R. P. Percival, Northenden, Manchester. 3 and *vhe*, W. H. Crabtree, Levenshulme, Manchester. 4, C. Sidgwick, Keighley. *Hen or Pullet*.—1, R. P. Percival. 2, J. A. Benton, Erdington, Birmingham. 3 and 4, W. H. Crabtree. *vhe*, C. Sidgwick, Keighley; H. Goodfellow, Mabley, Newcastle; Mrs. Bentley, Fernside, Upper Teddington; G. Palfreyman, Heeley, Sheffeld; H. Feast, Swansea. *he*, H. V. Story, Buddington Manor; Lady Bolton, Bedale; H. Yardley, Birmingham; W. A. Burnell; W. H. Crabtree.

COCHINS (Partidge).—Cock or Cockerel.—1, Mrs. R. Story, Derby. 2, R. P. Percival, Northenden, Manchester. 3, T. M. Derry, Geuney. 4, C. E. Pater, Sandy. *he*, E. V. Pryor, Welwyn, T. Sheppard, Humberstone, Leicester. *c*, E. V. Pryor. *Hen or Pullet*.—1, T. Stretch, Ormskirk. 2, W. A. Burnell, Southwell. 3, E. Todman, Whitechurch, Salop. 4, T. M. Derry. *vhe*, R. P. Percival. *he*, R. P. Percival; Mrs. R. Story; E. N. Fryor; T. Sheppard.

COCHINS (Any other variety).—Cock or Cockerel.—1, R. S. S. Woodgate, Penbury, Tunbridge Wells. 2, E. V. Pryor. 3, W. Whitworth, Longsight, Manchester. 4, C. Wilson, Elton. *vhe*, W. A. Burnell. *he*, H. Feast, Swansea. *Hen or Pullet*.—1, W. Whitworth, jun. 2, W. A. Burnell. 3, R. P. Percival. 4, E. Bishop, Gwydyr, Llangwst. *vhe*, W. A. Burnell; W. Whitworth, jun.; R. P. Percival. *he*, G. D. Wagstaff, Beeston; R. S. S. Woodgate; H. Feast, Swansea.

BRAMMAS (Dark).—Cock or Cockerel.—1 and 3, T. F. Ansell, St. Helens. 2, H. Lingwood, Creeping, Needham Market. 4, W. R. Garner, Dyke, Bourne. *vhe*, R. P. Percival. *he*, Miss E. E. Pawlett, Bedale; Lady Bolton; Bridgewater and Yoxall, Wednesbury. *Hen or Pullet*.—1, T. F. Ansell. 2, M. Leno, Markgate Street, Dunstable. 3, R. P. Percival. 4, E. Fritchard, Tettenhall, Wolverhampton. *vhe*, R. P. Percival; H. Lingwood; T. F. Ansell; W. H. Crabtree. *he*, R. P. Percival; F. Bennett, Shifnal, Salop; R. B. Wood, Uttoxeter; W. H. Crabtree. *c*, Birdwater & Yoxall; Rev. J. D. Penke, Chertsey; J. Lyon.

BRAMMAS (Light).—Cock or Cockerel.—1, H. Lingwood. 2, G. W. Pettit, Norwood. 3, F. Bennett, Shifnal, Salop. *vhe*, T. A. Dean, Marden, Hereford. 4, M. Leno, Markgate Street, Dunstable. *he*, R. P. Percival; W. J. Ford, Humberstone. *c*, Miss J. M. Foulkes, Montgomery. *Hen or Pullet*.—1, W. H. Crabtree. 2, H. Lingwood. 3, Capt. H. Savile, Wyke. *vhe*, Mrs. Port, Sharnbrook, J. R. Rodbard, Writington; G. W. Pater; J. H. Butler, Erdington, Birmingham. *he*, J. Benton, Erdington, Birmingham; Capt. Savile; C. Wilson, Langar, Elton; E. Mannoch, Woodridings, Pinner. *c*, P. Haines, Diss.

HAMBURGERS (Gold or Silver-pencilled).—Cock or Cockerel.—1, H. Beldon, Goldstock, Bingley. 2, W. Dixon, jun., Shipley Colliery, Derby. 3, C. J. N. Row, Milford. *vhe*, Mrs. G. M. Rods, Hendre, Monmouth. *he*, W. Speakman. *Hen or Pullet*.—1, H. Beldon. 2, J. Long, Bromley Common. 3, Waller and Wrighton, West Green, Stokesley. *vhe*, J. Smith, Lincoln. *he*, — Faulkner, Thrapston; — Speakman, Cheshire; Mrs. Ellis.

HAMBURGERS (Gold and Silver-spangled).—Cock or Cockerel.—1, H. Beldon. 2, J. Long. 3, — Curver, Barrowbridge. *vhe*, — Robinson, Baildon, Leeds. *he*, — Halham, Whitwick, Leicester. — Ward, Bardon Hill, Ashby-de-la-Zouch. *Hen or Pullet*.—1, Ashton & Booth, Broadbottom, Mottram. 2, — Robinson. 3, H. Beldon. *vhe*, — Hanson. *he*, — Gill, Ferncliff; Mrs. Newt in, Baildon, Rotherham; — Ward.

SPANISH (Black).—Cock or Cockerel.—1, — Wilkinson, Skipton. 2, H. Peldon; — Redford. *vhe*, — Dyer, Colgrave. *he*, — Thresh, Bradford. — Parker, Northdon. *Hen or Pullet*.—1, — Thresh. 2, — Pitt, Wolverhampton. 3, — Fowell. *vhe*, — Parker; — Woodhouse, Lynn. *he*, — Dixon; — Thresh.

HOLDANS.—Cock or Cockerel.—1 and 2, — Wood, Uttoxeter. 3, F. Lake, Sittingbourne. 4, — Quibell, Newark. *vhe*, — Grant, Bradford. *he*, — Drug, Faversham; P. Radford, Belper; — Quibell; — Hibbert, Hyde, Manchester. *Hen or Pullet*.—1, — Drug. 2, — Cullack, Littleport, Cambridgeshire. 3, — Coppicstone, Lostwithclie. 4, — Quibell. *vhe*, Mrs. Allcock, Sittingbourne. *he*, — Harrison, Grants, Over Sands, Lancashire; — Lake; — Akin, Shirkebeck, Easton; — Harrison; — Quibell; Rev. A. J. L. Dobbin, Notts; — Wood.

REV. CEIS, LA FLECHE, and LA BREDA.—Cock or Cockerel.—1, — Wood. 2, Rev. N. J. Rieley, Newbury. 3, — Harris, Bridgend. *Hen or Pullet*.—1, G. E. Murdoch, Reford. 3 and 3, — Wood. *vhe*, H. Barrow, Southwell.

ANY OTHER VARIETY.—Cock or Cockerel.—1, — Beldon. 2, — Robinson, Baildon, Leeds. 3, Rev. A. G. Brooke, Shrewsbury. *he*, — Burrows. 4, — Coppicstone, — Harrison; — Quibell. *Hen or Pullet*.—1, — Robinson. *he*, — Sidgwick, Keighley; — Feast, Swansea. *he*, — Stott & Booth, Preston. *he*, — Hawkins, Southwell. — Dean; — Feast.

GAME BANTAMS (Black and Brown-breasted Red).—1, — Eaton, Grantham. 2, R. Swift, Southwell. 3, K. A. Bradbury. *he*, J. Callidine, Heanor; E. Cope, Edgely, Southwell.

GAME BANTAMS (Any other variety).—1, E. Brownlie, Kirkecaldy. J. W.

Brockbank, Kirksanton. 3, A. C. Bradbury, Nuthall. *the*, J. Eaton, Grantham. *he*, J. Smith, Southwell; A. C. Bradbury.
BANTAMS (Any other variety).—1, Mrs. Wootton, Mapperley. 2, H. Beldon. 3, G. H. Poole, Bridge water. *the*, M. Leno, Dunstable.
SELLING CLASS.—*Cock and Cockerels*.—1, M. Leno. 2, C. Wilson. 3, J. T. Parker. *he*, P. Hutchinson, Spalding; Mrs. R. Storey, Derby; W. & A. Barton, Chatsworth; T. Sheppard, Humberstone; W. A. Burnell, *Pair of Hens or Pullets*.—1, Lady Bolton. 2, C. Wilson; E. Ellis, York. *he*, T. Sheppard; T. F. Ansell; W. A. Burnell; Rev. J. D. Penke.
DUCKS (White Aylesbury).—1, J. Hedges, Aylesbury. 2 and 3, Mrs. Wootton, Mapperley, Nottingham. *the*, Mrs. H. Crewe, Derby. *he*, E. Snell, Barrowden; W. Green, Clonton Bassett.
DUCKS (Rouen).—1, W. H. Robson, Crepham. 2, J. Harvey, jnn., Canterbury. 3, W. M. Eoe, jun., Newark. *the*, G. Harrison; W. Whitworth, jun., Manchester. *he*, A. C. Bradbury, Nuthall.
DUCKS (Any other variety).—1 and 2, M. Leno. 3, R. B. Smith. *he*, Mrs. Wootton; Mrs. Arkwright; T. Ashton, Wollaton; H. Yardley; W. R. Pratt.
GEESSE (White).—1, A. C. Bradbury. 2, E. V. Snell.
GEESSE (Any other variety).—1, W. H. Crewe. 2 and 3, Hon. Mrs. Colville, Burton-on-Trent. *he*, Mrs. A. Gny, Grantham.
TURKEYS.—1, G. R. Pearson. 2, N. J. Kingley. *Cock*.—1 and 2, E. Horner. 3, H. Yardley. *the*, J. E. Crofts, Worksop. *he*, C. H. Clarke, Old Sneyton.

PIGEONS.

CARRIERS—*Hen*.—1, H. Yardley. 2 and 3, E. Horner. 3, A. Billeysd, Nottingham. *he*, C. H. Clarke. *Young Cock*.—1, A. Billeysd. *the*, C. H. Clarke. *he*, T. C. Marshall, Nottingham.
POUTERS—*Cock*.—1, F. Graham, Sheffield. 2, J. Barker, Kew Bridge. *the*, E. Horner. *he*, G. Holloway, jun., Gloucester; E. Horner. *Hen*.—1, J. Barker. 2, F. Graham. 3, G. Holloway, jun.
BARDS.—*Cock or Hen*.—1, J. E. Spence, Seafeld. 2, H. Yardley. 3, E. Horner. *the*, J. F. Crofts.
TUMBLERS (Almond).—*Cock or Hen*.—1, H. Yardley. 2, J. Ford, Humberstone. *the*, W. P. Pratt.
TUMBLERS (Any other variety).—*Cock or Hen*.—1, J. Ford. 2, W. Woodhouse, Norfolk. 3, J. Baker. *the*, E. Horner. *he*, W. Woodhouse; J. W. George, Beeston.
DRAGONS.—*Cock or Hen*.—1, F. Graham, Birkenhead. 2, W. Gamon, Chester. *the*, H. Yardley. *he*, C. F. Herrieff, Eanbury.
FANTAILS.—*Cock or Hen*.—1, J. F. Lovesside, Newark. 2, J. Walker, Boston. 3, H. Yardley. *the*, J. Walker. *he*, J. F. Lovesside; Mrs. Wootton.
OWLS (Foreign).—*Cock or Hen*.—1, L. Allen, Southwark. 2, E. Horner. 3, H. Yardley.
TRUMPETERS.—*Cock or Hen*.—1, J. Lederer, Liverpool. 2, A. Van Meersch. *he*, E. Horner.
OWLS (English).—*Cock or Hen*.—1, J. D. Hustwayte, Nottingham. 2, S. P. Carver, Bournemouth. 3, J. E. Leighton, Nottingham. *he*, E. W. Van Tendon, London; E. Lee, Chesham; W. Woodhouse.
JACOBSINS.—*Hen or Pullet*.—1, J. Baker. 3, A. Wood, Worksop. *he*, L. Allen; J. Smith, Lincoln; A. Van Meersch; G. Hardy, London.
TURBETS.—*Cock or Hen*.—1 and *the*, J. Baker. 2, H. Yardley. 3, J. C. Crofts. *he*, A. Van Meersch; G. Hardy; E. Horner.
ANTWERPS (Long-faced).—*Cock or Hen*.—1, W. Gamon. 3, H. Gough, Wolverhampton. *the*, H. Yardley. *he*, J. Deacon, Sheffield. *he*, A. C. Bradbury.
ANTWERPS (Long-faced).—1, C. F. Herrieff. 2, W. Gamon. 3, R. Grey, Hyde. *the*, R. W. Pratt. *he*, W. Gamon. 3, J. Roberts, Thornton, Bradford.
NCBS.—*Cock or Hen*.—1, A. Van Meersch. 2, H. Yardley. 3, E. Horner.
ANY OTHER NEW OR DISTINCT VARIETY.—1, H. Yardley. 2, C. F. Herrieff. 3, M. Ord, Durham. *the*, J. E. Crofts. *he*, J. Baker; E. Horner; R. E. Wood.
SELLING CLASS.—*Cock or Hen*.—*Price not to exceed £1*.—1, H. Gough. 2, J. E. Crofts. 3, C. F. Herrieff. *he*, J. Carver; W. Woodward. *he*, J. Robinson; E. Horner.
SELLING CLASS (Any other variety).—*Price not to exceed 40s.*.—1, E. Horner. 2, P. Hutchinson. 3, C. N. Dutton, Chester. *he*, F. Cooke, Nottingham; W. Gamble, Mowbray; C. F. Herrieff; J. Cargill, York. *he*, A. C. Bradbury.

JUDGES.—*Poultry*: Mr. Dixon, Bradford; Mr. Hewitt. *Pigeons*: Mr. Esquilant; Mr. H. Ailsop.

LOUGHBOROUGH POULTRY AND PIGEON SHOW.

The annual Exhibition, in connection with the Agricultural Association, took place in the Elms Park, on the Leicester Road, on September 30th. The weather was all that could be desired; the arrangements by the energetic Secretary, Mr. W. Berridge, were good, and the Show well patronised.

The poultry tent contained many very excellent birds, some of which would rank with those exhibited at first-class shows. The first-prize pen of *Geese* were not only weighty but in capital condition. There were several good specimens of *Aylesbury Ducks*; but amongst the Rouen Ducks the most showy-looking pen failed to obtain a prize, owing to the white feathers in one of the flights. There were many fine birds of *Hamburgs*, *Game*, *Cochins*, and *Brahmas*.

There were six classes for *PIGEONS*, with good specimens of *Pouters*, *Carriers*, *Tumblers*, and *Turbits*. In *Carriers* the first prize was given to Blacks, Duns winning second honours. *Fantails*, nearly all White, were a noticeable feature. In the Variety class *Barbs* took the first prize, the second being given to *Trumpeters*.

GEESSE.—1, W. Woodroffe, Stamford. 2, J. Garton, Coates. *he*, W. T. Everard. *TURKEYS*.—1, W. T. Everard.
DUCKS.—1, M. M. Cashmore, Sheepshed. 2, J. Tyler, Loughborough. *he*, I. B. Dobell. *the*, W. T. Everard; M. M. Cashmore. *Aylesbury*. 1, Hon. F. Strutt, West Leake. 2, I. B. Dobell. *he*, M. M. Cashmore; I. B. Dobell. *he*, M. M. Cashmore.

GAME.—1, W. T. Everard. 2, J. Tyler. *he*, S. W. Hallam, Whitwick; W. T. Everard. *Cock*.—1, S. Smugherst, Kingstone. 2, S. W. Hallam. *he*, J. Tyler; M. Brown, Ash Kettleby; W. T. Everard.
DUCKS.—1, Hon. F. Strutt. *he*, M. M. Cashmore.
HAMPSHIRE.—1 and 2, S. W. Hallam, Whitwick. *he*, J. Tyler; J. Ward, Bardon Hill; M. M. Cashmore.

ANY VARIETY.—1, S. W. Hallam (Golden-spangled *Hamburgs*). 2, M. M. Cashmore (Golden-pencilled *Hamburgs*). *he*, S. W. Hallam; W. T. Everard; S. Clarke, East Leake. *he*, J. Garton.

GENE FOWLS.—1, T. Redshaw, Burton Bandalls. 2 and 3, I. B. Dobell.

BANTAMS.—1, S. W. Hallam. 2 and 3, M. M. Cashmore. *he*, J. Tyler.

PIGEONS.

POUTERS.—1, S. W. Hallam. 2, M. M. Cashmore. *he*, J. Tyler.

CARRIERS.—1 and 2, M. M. Cashmore.

TUMBLERS.—1 and 2, M. M. Cashmore. 2, J. Tyler.

FANTAILS.—1 and 2, M. M. Cashmore. *he*, J. Tyler.

TURBETS.—1 and 2, M. M. Cashmore. *he*, S. W. Hallam; J. Tyler. *ANY OTHER DISTINCT VARIETY*.—1, M. M. Cashmore (Barbs). 2, M. Brown (Trumpeters).

JUDGES.—Mr. G. J. Barnesby, Derby.

ECCLESFIELD POULTRY SHOW.

This was held on the 1st inst., when the following prizes were awarded by the Judge, Mr. Teebay.

DORKINGS.—1, Burch & Boulter, Sheffield. 2, W. Harvey, Sheffield.
SPANISH.—1, E. Brown, Sheffield. 2, Burch & Boulter.
COCHIN-CHINAS.—1, C. Sidgwick, Kettleby. 2 and *he*, W. Harvey.
BRAHMAS.—1, W. Harvey. 2, Bridgwater & Yoxall, Wednesbury. *he*, J. Eastshaw.
GAMES.—1, E. Hemmingsfield, Ecclesfield. 2, J. Denton.
HAMBURGH.—*Golden pencilled*.—1, T. Crookes, Owlerton. 2 and *he*, Burch & Boulter. *Silver pencilled*.—1, G. Hemmingsfield. 2, W. Harvey.
FOLANTS.—1, W. Harvey. 2, J. Heeley. *he*, A. & W. H. Silvester.
ANY OTHER VARIETY.—1, E. Brown. 2, J. Heeley. *he*, W. Beatty.
BANTAMS.—*Game*.—1, W. Harvey. 2, J. Smith, Walkley. *he*, J. Smith; T. Johnson. *Any other variety*.—1, Burch & Boulter (black). 2, K. H. Ashton, Manchester. *he*, K. H. Ashton; J. Farshaw; J. Simpson.
SELLING CLASS.—1, W. Bentley, Uppton; 2, Burch & Boulter. *he*, J. Heeley; A. & W. H. Silvester.
TURKEYS.—1, R. Lowe, Shugreen. 2, W. Shaw. *he*, J. Pearson.
GEESSE.—1, T. Ogden. 2, W. Shaw. *he*, J. K. Shaw.
DUCKS.—1, J. Shillito, Fittisworth. 2, J. Denton. *he*, D. Green.

PIGEONS.

CARRIERS.—1, J. Smithers. 2, W. Harvey.
TUMBLERS.—1, W. Harvey. 2, A. & W. H. Silvester. *he*, H. Yardley; W. Harvey.
FANTAILS.—1, W. Harvey. 2 and *he*, E. Brown.
ANTWERPS.—1 and *he*, J. Smithers. 2, H. Yardley.
JACOBSINS.—1, J. Earnshaw. 2 and *he*, W. Harvey.
POUTERS.—1 and 2, W. Harvey.
ANY OTHER VARIETY.—1, W. Harvey. 2, J. Earnshaw. *he*, A. & W. H. Silvester.
H. YARDLEY.—E. Brown.
BARDS AND TRUMPETERS.—1 and 2, W. Harvey. *he*, H. Yardley.
OWLS.—1, J. Smithers. 2, H. Yardley. *he*, T. Hey.

RABBITS.—*Heavy*.—1, M. Marsland. 2, G. Kirkby. *Best colour*.—1 and 2, W. Alison. *he*, G. Kirkby.

NOTTINGHAM BIRD SHOW.

The annual Exhibition of Canaries, Mules, and British Birds was held at St. John's Schools, on October 5th, 6th, and 7th, 1874. We will furnish a report of the Show next week.

NORWICH.—*Clear Yellow*.—1 and 2, J. Adams, Coventry. 3, J. Audley. *he*, J. Evans, Derby; S. Tomes, Northampton. *he*, T. Smith, Coventry. *Clear Buff*.—1 and 2, J. Adams. 3, S. Tomes. *the*, J. Evans; S. Roberts, Derby. *he*, J. Evans; T. Smith. *he*, J. Audley; T. Smith.
NORWICH.—*Variegated Yellow*.—1, T. Adams. 2, J. Audley. 3, H. Watson, Litchurch, Derby. *the*, W. Richards; J. Evans (2). *he*, S. Tomes. *he*, S. Buckle; A. Duke, Sneyton. *Variegated Buff*.—1, T. Adams. 2 and 3, J. Evans. *the*, W. Richards; W. & F. Gawnthorne, Nottingham. *he*, J. Goode, Leicester.

NORWICH.—*Ticked Yellow*.—2, W. Greaves, Nottingham. 3, S. Tomes; J. Goode. *Ticked Buff*.—1, J. Adams. 2 and 3, T. Smith. *the*, J. Evans; J. Audley. *he*, J. Evans; S. Roberts; C. Mendenhall & Ellerton, Darlington; T. Alden, Norwich. *he*, W. West; R. Whitaker, Darley Abbey, Derby; S. Tomes. *Disqualified*, G. Doman, Nottingham.

NORWICH.—*Yellow Crested*.—1 and 3, Clark & Newton, Nottingham. 2, S. Roberts. *the*, Clark & Newton; T. Alden; J. Goode. *he*, J. Evans. *Buff Crested*.—1, G. Doman. 2, J. Torr. 3, J. Goode. *the*, Clark & Newton; W. Richards, Bulwell; J. Evans; T. Alden (2). *he*, F. Murden, Nottingham; J. Evans; T. Alden. *he*, J. Torr, Derby; S. Tomes; J. Goode. *Disqualified*, G. Holmes, Nottingham.

BELOIAN.—1, K. Hawman, Middlesbrough. 2, J. Wilcockson, Bulwell. 3, R. Whitaker. *the*, J. Wilcockson, Bulwell; H. Davis, Wolverhampton; R. Whitaker. *he*, W. Corbett.

LIZARD.—*Jongue*.—1, C. Mendenhall & Ellerton. 2, S. Godher, Nottingham. 3, W. Richards. *he*, K. Jackson; J. Evans. *Grey*.—1, S. Roberts. 2, W. Richards. 3, S. Godher. *he*, J. Evans. *he*, C. Mendenhall & Ellerton.

CINNAMON.—*Jongue*.—1, 2, and 3, J. Adams. *he*, J. Evans; S. Tomes. *Buff*.—1, 2, and 3, J. Adams. *the*, J. Evans (2); S. Tomes. *he*, T. Tenniswood, Middlesbrough.

ANY OTHER VARIETY OF CANARY.—1 and 2, J. Adams. 3 and *the*, J. Adams. *he*, J. Evans; J. Spence.

MULES.—1, J. Spence, South Shields. 2, T. Tenniswood. 3, J. Goode. *the*, W. Richards, Ryson Green; D. Wright, Nottingham; R. Hawman. *he*, J. Williams, Whitehaven (2); J. Adams; S. Roberts. *he*, J. Evans.

BRITISH BIRDS.—1, Whitehead. 2, R. Worth, Nottingham. 3, J. Evans.

SELLING CLASS.—1, J. Evans. 2, R. Whitaker. 3, Clarke & Newton. *the*, H. Woodhouse, Nottingham. *he*, Clarke & Newton (2); J. Scrimshaw; J. Evans.

JUDGES.—Mr. G. J. Barnesby, and Mr. G. Tuckwood.

PIGEONS AT THE BIRMINGHAM SUMMER POULTRY SHOW.

The Pigeons were chiefly shown several tiers high in a room adjoining the hall. It was almost impossible to see those on the ground, especially in the corners of the room, and the Judges must have had a most difficult task.

Black *Carrier* cocks headed the list, Mr. Yardley winning the first prize with a bird marvellous in wattle. The competition in *Dun* cocks was strong, the same exhibitor again taking first honours. In cocks Any other colour, a Blue (Mr. White) in splendid condition, but not large in wattle, was first; second was an excellent bird, but in moult. There were thirty-four competitors for the cup for a young *Carrier*. Mr. Bulmer won it with a Black long in body and very promising. Second was a forward *Dun*.

Pouters were few from the fact of all colours being mixed. In cocks the *cnp*, second, and third prizes all went to Blues; in hens the cup bird was a Blue, second Black, third Yellow.

Barbs.—The first prize in all three classes went to Mr. Firth. Mr. Yardley's second-prize hen was a superb bird, but out of condition. In the class for young birds there seemed to us little to choose between the winners.

Tumblers.—Almonds were as usual few and good. Mr. Woodhouse carried off all the prizes in Balds or Beards. First and third were Blue Beards, second a Red Bald.

In the class for any other Short-faced variety Mr. Minnitt took first with a lovely Black Mottle in blooming condition.

Three classes for Long-faced Tumblers brought out many curiosities only known to the initiated. We especially admired a Black Mottle Muff-legged belonging to Mr. Mapplebeck.

Pantails must have given the Judges the trouble they usually have over this class; at least the White ones must, so different do the same birds look in different positions and at different moments. We thought a young bird highly commended (No. 843, Mr. Serjeantson), one of great promise. The cup for Any other colour was won by one of the best Blacks in colour and carriage we have ever seen, a peak-headed bird.

Jacobins.—The Reds and Yellows were in a bad light, first apparently a rich Red with head buried in a perfect hood. First in the "Any other colour" class was a little White, Mr. John Baker's, perfect in head and chain.

Turbits.—The class for Red or Yellow was specially marked by the Judges a good class, and it certainly bore out their notice, being uniformly excellent. The cup went to a Yellow, perfect in colour and frill, but narrower in head than we like. It was pressed hard by the second, a veteran winner, shown by Mr. Cresswell, a rich Red with a fine broad head. Third an excellent young Red. Mr. Dew won the cup for Any other colour with a grand Silver; second a lovely Blue, third a Silver.

Nuns were not remarkable. The cup went to a nice Black, a Yellow being second.

Owls.—The class for English Owls was a very large and good one. We are glad again to see White Owls; one of great merit won the cup.

Trumpeters.—The new type of birds imported of late from Asiatic Russia as usual carried all before them. We much regret that the beautiful White Trumpeters of former days have almost disappeared since these new importations.

There were four classes for *Dragoons* and four for *Antwerps*, the awards in which seemed to give satisfaction on the whole. *Swallows* and *Magpies* also had classes, likewise *Archangels*, but a pile of boards over the latter variety precluded all possibility of admiring their bright hues or of criticising the awards.

The Any other variety class was an interesting one. Importations of a kind of feather-legged Turbit have of late been made from Egypt and elsewhere in the East; their colour is splendid, but they are to English eyes disfigured with coloured spots about the head. The cup was awarded to a Red bird of this variety. Second was a curious Red Frillback, third a Satinette. We admired two unnoticed birds (*Damascenes* we believe they are called), ashy blue in colour with dark eyes.

On the whole everything was done to make the Pigeons as comfortable as possible. The great heat of the first day threw many birds deep into the moult in a few hours, but no harm need result from this.

PRIESTS.

PRIESTS or Quakers are the pet toys of many fanciers; and here the old adage is very applicable, "Everyone to his fancy." For myself, my fancy runs in a different channel, though I remember well with what happiness I carried home the first pair of Priests I ever owned. They were very ordinary birds, as judged in these days, but to me they were priceless. The rest of the afternoon was spent nailing boxes against the house wall; and as the boxes were too heavy for a boy to handle, occasional tumblers of box, boy, and birds drew forth peals of laughter and merry shouts from our neighbour's daughters, before whose eyes I was always a shamefaced youth. It may be that same experience was what ultimately caused me to dislike the Priests. Not that the young ladies were at all disliked; but what boy can stand his interest in his Pigeons made a matter of amusement, and yet preserve his equilibrium? As sure as I went into the garden to look up at my Quakers, so surely did those girls look out of the window and whistle "Hua, hua, hua." Many is the time they have driven me away with a forlorn smile on my lip and bitterness in my heart to wish my Pigeons were dead. Ah! but I have had my revenge since those days. Both those girls have husbands, both have children, and both have Pigeons—Pigeons in their garrets, in their stables, in their cellars. Yea, I saw this day a pair of cropped-winged birds upon the baby's crib, as I examined the oldest boy for the measles. His last words were, "When are you going to briog me the Quakers?" His mother's benediction was, "Doctor, if you bring any more Pigeons here, you shall never enter my house again. It is all your fault, I cannot have a clean room to sit down in."

My readers, you cannot tell how well I felt as I drove home, knowing the merriment and whistling is all on my side now. That boy will be here after the Quakers as soon as he gets out;

and every time I see his mamma it is only necessary to "hua, hua" once or twice to awaken the merriest memories of the past. The bitterness of my youthful days is gone, and we can afford to laugh amid our retrospection at what was then the most important object of our lives.

Now that we have reached a breathing place, you may ask, What has this to do with Priests? Why, but for what has been written, no article on that variety would have followed, nor would I have impressed upon you how necessary it is that we should enter into the sympathies of the little people. They cannot understand us; therefore, to insure their happiness, try to understand them; the effort wonderfully repays us. If your boy wants Pigeons, help him to fix up for them. Do not laugh his fancies to scorn, or you may chill all the feelings that bind him to his home; and recollect, your fancies for your cigar, novel, or horse are no more intense than his for his (to you) inferior interests.

But enough of this. Let us to the Priests, as they are called in Germany, on account of their white cowl, and in contradistinction to the black veil of the Nun; or Quakers, as they are called in this country, by reason of their firm, sedate, and sombre appearance.

The Priest is about the size of the common, and the plain birds are not unlike it in shape, but the Starlings partake more of the shape of the Suabian or Archangel, to which they are nearly related. The Priest is a solid or whole-coloured bird, with the exception of the head, which is bald or white. The line between the colours passes through the centres of the eyes, and along the inner and lower part of the hood, which must be free from any foul white feathers. The upper half of the head is white, the lower dark. The eye is generally mixed, but I have seen them where the upper half was pearl, the lower half dark; thus partaking of the colours of the head and neck. The hood must be proportioned to the size of the bird, and in the ordinary colours it must be a perfect cup-edged hood; but in the Starling a point head is frequently seen, and does not detract from the beauty of the bird; the feet closely covered with short feathers, among which no whites are allowed, not even on the toes. The Starlings are clean-footed, and indeed ought hardly to be ranked with the Priests, as they more nearly approach the Suabians and Archangels. There are plain Priests, which signifies that the colours—black, red, blue, and yellow—are solid (except the Baldhead), without bars across the tail or wings; then there are barred Priests, in which the bars are allowed; and also white-barred birds, in which white bars occupy the positions on the wings and tail, in place of the dark bars generally seen. Of these, the red and yellow birds with white bars are rarest; the plain birds next. The Starling or Star Quaker is a black bird with white bars across the wings, and a crescent-shaped band of finely-spangled iridescent iridescent feathers about the throat, the upper border of which is straight across the neck, and distinctly marked; the head is bald, and feet clean. The following points may be useful to judge by:—

1. **Colouring.**—A coloured bird with white head, the line of division passing through the centre of the eyes, within the base of the hood, and sloping at the corners of the mouth.

2. **Eyes.**—The upper half pearl, the lower half dark.

3. **Feet.**—Covered with short close feathers, except the Starlings, which are clean.

4. **Hood.**—Well-proportioned, clear on the inside; the Starling sometimes point-headed.

5. **Colours.**—Black, red, blue, yellow, and starling.

Sometimes the Priest degenerates, and loses nearly all the white of the head, excepting a spot near the base of the beak, then it is called a white spot.—Dr. W. P. MORGAN (in *American Fanciers' Journal*.)

[The lively-writing Dr. Morgan is more amusing than ever in the above article. It must be worth being what children call "a little ill" to have the doctor in attendance. In regard to the Pigeons called Priests, they and Blue Brunswicks, similar birds, appeared at our shows a few years since; but I have not seen any recently. The fact is that German Toys don't take in England. Our fanciers seem to ask for something more than the ordinary Pigeon form, with variations only in the colour and disposition of the feathers. John Bull perseveres with the older fancy Pigeons, and fights for perfection in their many properties; but is no great feather fancier. Then Sandy Scot sticks to his Pouter (long Pigeon suits long face, aye! and long head too, for Sandy has that long as well as his face), and he tries hard to lengthen the limb, narrow the girth, and enlarge the crop of his pet; but he, too, is not a feather fancier. Perhaps all this is a pity; but so it is. We read about German Toys, but we do not care to keep them, or, at any rate, we do not give our hearts to them.—WILTSHIRE RECTOR.]

ORNAMENTAL WATERFOWLS.

In answer to "T. H. T.," there are two sorts of "tamed wild fowl." In one they are wild birds compelled to make the best of a bad bargain, because they are pinioned and unable to fly

away; in the other they are bred either from these domesticated parents or from wild eggs that have been taken and put under tame birds. It is, however, necessary with both either to pinion them or to keep their wings so cut that flight shall be impossible. Although Ducks are called waddlers, and are supposed not to be clever on their feet, still they will stray a long way, and with the help of hiding places here and there may be found in the course of twenty-four hours far from their home. If it is easy for them to do this, it is much easier for them to follow a stream. Having, as you say, a pond 60 yards in circumference, we would advise you to fence-in with wire between 3 and 4 feet high three sides of the pond; the fourth, ending at the stream; should be also fenced-in, but with a strong iron grating reaching to the bottom. Ducks dive. A small island might be made in the following manner:—A strong framework of rough timber, moored by means of a strong chain attached to a stone, weight, or anchor sufficiently heavy to retain it in position. It should then be covered with earth, and planted with fast-growing shrubs that thrive in very damp localities. It is well if the fences of which we have spoken be 5 or 6 yards from the water's edge, and there may be planted at intervals rhododendrons, hollies, &c., with a pathway through the middle of them. With us such a place, stocked with beautifully-plumaged Ducks that come to whistle to be fed, is always a relaxation and resort. The banks may be of turf down to the water's edge. At each side, or in two places at each side, the bank should be cut through, leading straight into the water. These are to the Ducks what man-holes are to labouring men when they are overtaken by a train from which they are unable to escape, and find themselves in a tunnel. The beaten Duck cannot climb the upright if not overhanging bank, and submits to its fate—either beaten to death by its pursuer or drowned; but if it comes to one of these openings it is at once ashore, and is safe. It may appear paradoxical to speak of drowning a Duck, but it is a fact that a Duck drowns as readily as a hen. So long as the outer plumage is waterproof so long a Duck is buoyant, but if from confinement in a dry place this outer feathering becomes dry, the water finds access to the down, the bird becomes, if the term may be used, "water-logged," sinks deeper and deeper till the head falls under the surface from sheer inability to hold it up, and the Duck drowns.

Carolina Ducks, Muscovies, and Egyptian Geese are the only, or almost the only water birds that perch. The Carolina will not make a nest, nor lay in one. It must have a small kennel like a dog kennel, made of plain plank, with cross pieces nailed across it, standing on a pile, and having a small ladder running to the water, as in *fig. 99*. Such huts are not unsightly on a piece of water like that which you describe. These birds also greatly delight in perching on old pollard stams, and these look rather well standing a few feet from the bank in the water.

Fig. 99.

Your house that you mention will never be tenanted. Tame—i.e., farmyard Ducks will take to such a place. Wild fowl will get under shrubs or banks, or any place that offers the security they require. They are clever in finding it. Many, nearly all, will roost on the island if you make it. Cats and water rats are both enemies, but the latter are not to be greatly feared, and the cats will not take water after them. Carolinas, Mandarins, Shell-drakes, Brazilian Pintail, Casarkas, Whistling Ducks are all to be had tame-bred, and the addition of a couple of pairs of Brown Call Ducks will help to keep them together. They should be fed in shallow water where there is a gravel bottom, with water clear enough to see every grain of corn that is given. They will dive after it, but if given in thick and deep water the loss is great.

These birds that may be made tame by pinioning, by association, and by good treatment are Dumbird, Tufted Duck, Pintail, Widgeons, Shoveller, Garganey, Scamp, Gadwall, and Teal. These remain tame as long as they are confined. Whenever they have the opportunity they get away. The food should be barley, Indian corn, buckwheat, a little hemp; nothing helps more to keep them tame than at times to give them some crumb of bread, they are very fond of it, and as it floats it causes amusement to see them all after it.

Keep the Peafowls in confinement for a time, and feed them well. When first let out tie their wings that they may not fly.

CRYSTAL PALACE BEE SHOW.

Is "BEATEN BUT NOT DISMAYED" right in the facts in his statements about driving bees at the Crystal Palace? I was much interested in this part of the Exhibition; and though I

saw hundreds if not thousands of dead bees on the floor of the balcony devoted to the manipulation, I attributed the loss of life to the people treading on those bees which happened to settle on the ground, and not to fighting amongst themselves, of which I saw no trace while I was there. From what we know about the wonderful instinct and memory of bees I do not think they were unable to distinguish their own homes. I was surprised to find the various hives working so steadily and systematically in spite of the confusion inevitable to the manipulation and the people constantly going in and out. The loss of bee life is of course to be deplored; but in the general diffusion of the means of saving the lives of bees by driving and uniting them to other stocks instead of consigning them to that monstrously cruel because lingering death, the brimstone pit, I think this part of the Exhibition was practically most successful in furthering one of the principal objects of the British Bee-keepers' Association, "the advocacy of humanity to the industrious labourer, the honey bee."

I think it would be good policy for the Committee to allow labouring men and bee-keepers of the humbler classes admission to the manipulation at a nominal price, say 1d. or 2d. Sixpence virtually excludes this class, which is the very one that would benefit most by a practical knowledge of the means of driving the bees without destroying them. I would further suggest that the Secretary provide a better and quieter room for the next meeting of the members of the Association. I do not say this by way of complaining, as I for one feel that the members of the British Bee-keepers' Association are very much indebted to Mr. Hunter, Mr. Abbott, and others for their work and trouble on our behalf, in causing this first exhibition of the Association to be such a success.—A YOUNG APIARIAN.

HONEY HARVESTS.

FOR six or seven years my balance sheet of bee-farming has been published annually. From various causes I shall not be able to present a fair balance sheet this year. Last winter all my best stocks of bees were sold; everyone in my possession likely to do well was bought. Many orders came that could not be met, simply because the stocks left were considered not worth selling—not good enough to put into the hands of buyers. Last winter dysentery attacked many of our hives, and thinned their populations to a great extent. My hives in March this year were weaker than it is possible to describe. Being rather too old to manage so many hives, it is my intention to reduce the number of my stocks. If I give up my large farm, I shall settle down to a small apiary of ten or twelve hives. If I cease to be a bee-farmer I shall become an experimental apiarian, and keep all within the limits of my own grounds. Hitherto I have kept bees for profit, and managed them with the least possible trouble.

The hives I have used are, in my opinion, incomparably better for bees and honey than any other kinds I have ever seen or heard of. In a week or two the attention of the reader will probably be called to various kinds of hives. Next year I shall most likely introduce various hives into my experimental apiary. Let no one fancy or say that in doing so I shall be seeking a better or more profitable hive than such as those I have so long used. No, I do not expect ever to find any other kind of hive equal to them for profit and convenience; but for the sake of contrast and variety, it seems desirable to have several kinds introduced into an experimental bee garden. I shall be exceedingly pleased if the Bee-keepers' Association offer next year their highest prize for "the best kind of hive for bees and honey," the hives for competition to be filled or partially filled by swarms of 1875, and exhibited without bees. No other prize will touch so important a question as the one now suggested, or please so many bee-keepers.

Taking Great Britain as a whole, I think that 1874 has been the best of the last six years for honey. Twice or thrice during that time have my best hives risen in weight to 100 lbs. each; but then the stocks were much stronger in spring, and swarmed much earlier than those of this year. This year March, April, and May, with the exception of the last ten days of April, were very unfavourable for honey-gathering and bees. More favourable weather occurred in June, the first half of July, and ten or eleven days of August. From the 19th to the 30th of August bees gathered honey fast on the moors.

In almost every district of this country swarming was unusually late, and I hear that in some counties few swarms were obtained. Satisfactory accounts come from many parts of England; more honey has been obtained this year than for some years past; but most correspondents have not given the weights of their hives, or the quantity of honey obtained. All, however, seem encouraged by their success in artificial swarming and uniting swarms. They are in the calm and hopeful possession of a theoretical and practical knowledge of bee-management.

Our old friends at Carlisle, Lancashire, are hardly pleased with the results of bee-keeping there this year. Swarming was

late, and only two first swarms in the parish rose in weight to 100 lbs.; a few swarms weighed 90 lbs. each, more 80 lbs., and more below these weights.

Being rather unwell during September I was unable to fetch my hives from the moors at the end of the season. They remained on the highlands of Derbyshire, consuming their stores, till the 3rd inst. Some of them I found are rather too heavy for me to handle and carry. Some of them now are between 90 lbs. and 100 lbs., some more than 80 lbs. each, some more than 70 lbs., and many less than that weight. This year the stock or mother hives are as heavy as their first swarms, which is an unusual occurrence, as first swarms in ordinary seasons generally rise in weight 20 lbs. and 30 lbs. more than their mother hives; but this year swarms had not time enough to overpass the parent hives. At the swarming season this year stock hives gathered a great deal of honey.

Where bees are kept for profit it is good policy to take honey when it can be obtained. When a good season comes round I deem it wise to reap a large harvest of honey, even to the reduction of the number of stocks. It is easy to multiply stocks in seasons in which honey is not stored in quantity. In grape-growing a crop is expected every year; in bee-keeping we cannot get a harvest of honey annually; it is therefore wise to take a large harvest of honey as often as possible. Honey will be taken from all our hives that weigh more than 60 lbs. each, and those of less weight will be kept and sold for stocks.—A. PETTIGREW.

A FIFTEEN-YEAR-OLD SWARM OF BEES.

EARLY in July, 1859, I put a swarm of bees in a common box hive made of rough hemlock boards 12 inches square by 15 inches high. From this hive has issued a swarm every year until now.—SOL. CRANDELL, *Chatham Village, Col. Co., N.Y.*

[I may mention a parallel case. Some fifteen years ago I called on Mr. Samuel Brundrett, market gardener, Withington, near Manchester, to buy some hives of bees, when he showed me one which had swarmed annually for twelve years. It looked as if it had not been touched or raised off its board during the whole time. I have seen many old ones, and examined them internally. Their combs were black and tough enough, certainly. Every young bee leaves a pellicle or skin in the cell in which it is bred, and of course the cells of old combs become contracted by breeding in them. It has often been said that bees reared in old combs are smaller than those reared in younger ones; but we have frequently failed to notice the difference in size, and sometimes we have fancied they are less in old hives. Bees thrive better among young combs than they do in old ones, and young combs yield more honey than old ones; but I can easily believe that the combs of a hive may be used by bees for fifteen or twenty years if they be kept dry and free from foul brood. Too much honey and farina in hives hinder breeding and do harm. In nine cases out of ten, hives three years old have too much farina in their brood combs, which clogs their operations.

A New Zealand bee-keeper, now in this country on a visit, called to see me the other day. He first described how bees were managed in that colony. The bees are kept in plain boxes about 12 or 14 inches square. When full, boxes as large are put on them as supers. He had taken 80 lbs. of super honey from one hive last year. When the combs become black the empty boxes are placed below them, and when full they are destroyed for their honey. In this way the boxes are refilled with young combs. Thus, as here, swarming takes place, and is not prevented by supering in every case.—A. PETTIGREW.]

DOGS.—No. 6.

WIRE-HAIRED TERRIERS.

PROVIDENCE that "suits the wind to the shorn lamb," has very beautifully and mercifully suited the dog's coat to the climate in which he is born. Take a few instances in proof of this. Look at the Siberian dog, the dog that in teams draws his master's sledge over the frozen snow. How very long and rough is his hair! how easily from it falls the snow, and how difficult for the snow to penetrate to the skin! Surely his coat is fitted to his climate. Then the Mount St. Bernard is another snow-fitted dog as to coat; and mark you, the rough one is the right one. Then the Scotch colley, the rough one again is the right one. How his hard thick coat which no rain, not even that Scotch mist which the proverb says "wets an Englishman to the skin," can reach his skin. Then there is the Scotch deerhound, rough and warmly clad; the Irish greyhound who can face dank Ulster's climate with his rough warm coat. There is the Scotch terrier with his warm hard coat, fencing well his hide. The Russian greyhound is another example who has actually bushy hair; while the Siberian dog before mentioned has long hair even on his head and paws, so well protected he against that cold climate. If I look at the naturally swimming dogs, I see again the adaptation of the dog's coat—as

the Newfoundland, the Irish water spaniel; I see in them a like merciful arrangement. And I imagine that all the dogs originally in this chilly island of ours were rough-coated—i.e., warmly clad—coat fitting climate. If it be true that the modern otterhound is the true representative of the southern hound, my argument is much strengthened, for the otterhound is warmly clad.

But how about the English terrier? What was he in olden time? Not, I verily believe, the smooth-skinned sleek creature of to-day's civilisation. Was he, like the Scotch terrier, very long-coated? I also think not. Scotland is much colder than England. The Scotch sheep-dog is much more warmly clad than the old-fashioned, bob-tailed, hard, wiry-coated English sheep-dog. What, then, do I believe the English terrier to have been as to coat? I believe him to have been wire-haired. This is a particular kind of coat, but it is admirably suited to the dog's work and ways. Long hair would hinder him, but he is exposed to climate in bad weather. Look at his coat: he has a thorough good loin-cloth as ever man wished for, or had on his favourite horse on a bitter December day, when the rain is falling in torrents. Then the mist may fall on his head, but it only hangs on his thick moustache, and can easily be shaken off; and his chest has a like rough warm cover. In fact, taking the climate of England, he is as well and sufficiently covered as even the Scotch terrier is for the climate of Scotland. The wire-haired dog should have a coat somewhat like cocoa-nut fibre, in no case silky or approaching to silky. This wire-haired terrier, called in books sometimes and rightly, "the old-fashioned hard and wiry-coated dog," is not now often seen, but he is, I believe, the genuine English terrier, the best of all terriers suited for work in this cold, damp, east-wind-pestered climate. If you look at the terrier in Bewick's "*Quadrupeds*," you will find such a dog; and any old book represents a terrier rather rough than smooth.

In regard to the value of wire-haired terriers I give the following anecdote, which is less than a year old:—A relation of mine who lives in the midst of a hunt famed all over England, was talking one day last winter with the man who has the care of the terriers (both kinds are kept, the wire-haired and the smooth), and he asked him which he preferred for work. The reply was, "Well, sir, these smooth ones are good for anything, capital dogs sir, but then they shiver so on cold days. They are all right such days as this (it was a lovely sunny winter day), but the rough ones don't shiver, and bear the cold and wet best, so I like them the best." The smooth-haired fox terriers are charming dogs and to them I shall devote a paper; they will face anything, will go into any damp drain, and some will swim well; but, oh! how they suffer in cold weather. The pluck is in them, the heart is all right, but man has robbed the poor dog of that warm covering which was intended to keep him secure and safe in damp earth, or mud, or winter's water. Man alters for fancy and for eye, but I doubt whether he ever improves, so far as usefulness is concerned. In olden days it was rather sport than fancy; and although I cannot and will not uphold cruel sports, yet I must say there is some cruelty in making, so to speak, a terrier work in the cold without his coat on, the coat his Creator gave him for protection and comfort too. I dub, therefore, the wire-haired terrier, now seldom seen, as the genuine old English dog of this breed. He is a dog, like all terriers, very companionable, a cheerful dog; and if he follow a one for miles in the wet and cold, one does not feel that he is suffering as the smooth dog does, when, covered with mud and chilled to the bone, he looks up with a pitiful face as much as to say, "Oh! master, I wish I had a warm coat, but your race, mankind, has robbed me of it." I have often felt very sorry to see a poor smooth-haired terrier in thorough bad case from wet and cold.

The wire-haired terrier class has not as yet been a large one at shows, not even at Birmingham. Their chief breeder, as far as I know, is Mr. Wootton of Mapperley, whose dogs I have seen and admired at Birmingham, and a photograph of some of his dogs, certainly the right sort, is now before me. I regret much that the wire-haired terrier is not among that admirable series of photographs of prize dogs painted by George Earl, the painter, to my mind, of dogs now Landseer is no more. His fox terriers, his English terrier, his bull terrier, are admirable and life-like; but why has he omitted the wire-haired, the oldest of all? If I am told that the wire-haired is a vermin dog, I reply, Of course he is, that was what he is intended for? Are there no vermin in England still? Have the rats gone back to Hanover? Are stoats, weasels, polecats no more? Besides, he is more than a vermin dog—he is that and more too—what dog better when rabbits are to be killed?

I have said that all terriers are companionable, sprightly, cheerful dogs. Years ago—I was but a boy then—I made, in company with my father, a driving journey of between thirty and forty miles into Norfolk. A wire-haired terrier was with us as merry, and active, and inquisitive—bolting into this hedge, through that gate—the last few miles as he was the first few. Weariness he did not seem to feel. Was not that warm coat of

his a supporter of his strength? Well, the last few miles the road ran across a rabbit warren, and oh! the dog's delight then. Never had he seen so much game before; never did he enjoy such sport. "Rabbits young, and rabbits old; rabbits hot" with running, "and rabbits cold" with fear, were around him. The place was alive with them, and he quite forgot his long journey. My readers can imagine my boyish delight—I kept rabbits then—at seeing such a number of rabbits out feeding in the moonlight, the games they played, some out from their nests for the first time; little rabbits, half grown rabbits of all sizes, eating, playing, scampering, and racing-off as the dog approached. But turning my thoughts to old times, I must call up another scene connected with wire-haired terriers. There was an old man I knew and loved to watch who was a rat-catcher—a little old man, a bent old man, who looked more bent because on his back was always his box of ferrets. He had a hump on his back, and I never knew he wore a loose old coat where the hump ended and where the ferret-box began. He wore a cap, I fancy of cat skin, and he smoked so short a pipe that my wonder was he did not burn his nose; I looked upon that nose as a kind of salamander. On an autumn or winter's morning I used to see this old man tramp off from the town to the fen farms with his team of dogs, everyone wire-haired, usually white with a touch of colour on eye and ear, one or two might be black and tan. Now this old man was worth nothing but his dogs and his ferrets, his clothes, pipe included, counting for nothing; but he would not sell one of those dogs. He kept to one breed, and no one in that town could get one of him for fear the breed should make another rival in his trade. Poor old man! a grim silent man, so different to the merry dogs that were always with him. He was full of employment, and I connected him in my mind with the sound of the flail which I used to hear for weeks and weeks in the fen barns. I distinctly remember that the old man's dogs were smaller and not as wide in the head as those usually seen of the wire-haired breed.

In now drawing to a conclusion my remarks on the wire-haired terrier, I would say, Why should not breeders take up this dog and improve him? Narrow his head by crossing with a good coarse-haired but well-shaped fox terrier; both dogs have the heart in them. Some fox terriers, the best of them, have hair of such a texture as shows clearly that they are related distantly to the wire-haired. Cross these two; make a pretty dog, not a large dog; show such dogs clean, and I venture that, the eye being pleased and humanity being pleased by a thick coat being again put on the terrier's back, such a breed would in time be a success—a prettier dog, neater in shape, straighter legs, narrower head, with nice markings. The moustache gives a quaint look, and the pluck being there, as it would be, such a dog would be popular, and the genuine old English terrier, for such I believe the wire-haired to be, would be worthily represented.—WILTSHIRE RECTOR.

OUR LETTER BOX.

OXFORD POULTRY SHOW (T. L.).—The entries close on the 12th inst., as you will perceive on reference to our list.

BANTAM PULLET AILING (G. H. R.).—Give your pullet a dose of a teaspoonful of castor oil, and notice if her evacuations afterwards be green and loose. If so, repeat the dose at twelve hours' interval. Give her no corn or hard food, but soaked bread, oatmeal, and growing green food.

SILVER PHEASANTS (J. P. Highgate).—There are but few buyers for a Silver cock Pheasant or for hybrids. We should advise you to advertise them, or to exhibit them as extra stock at some poultry show.

CONDITIONAL SALE (J. Ashworth).—You had not absolutely purchased the Silver Poland hen; she was to be sent to you for approval. Before being sent she won the first prize at Birkenhead, and thereby her value was increased, a circumstance which neither you nor Mr. Fearley the vendor contemplated at the time the price was named. We therefore cannot consider you entitled to claim the hen either legally or equitably.

PEARS (H. Williams).—In making perry the pears should be ground and pressed exactly in the same manner as apples in the making of cider; but the reduced pulp should not be allowed to remain any length of time without being pressed. In Herefordshire, or the counties in its vicinity, it has never been the practice to blend the juices of the different varieties of the pear in order to correct the defects of one kind by the opposite properties of another. It is, however, thought more easy to find the required portion of sugar and astrinency, as well as flavour, in three or four varieties than in one; therefore, it is supposed a judicious mixture of fruits affords a prospect of great benefit. In grinding, the pulp and rind of the pear, as in the apple, should be perfectly reduced; and though no benefit is said to be derived from the reduced pulp remaining some hours unpressed, yet there is no doubt but, where all other circumstances are the same, that portion of liquor will, for the most part, be found the best which has remained the longest under the power of the millstone. The juices of the pear and the apple are constituted of the same component parts, but the proportions are different. In the juice of the pear the tannin principle is predominant, with a less portion of sugar, mucilage, and acid matter. Perry requires nearly the same sort of management during the process of fermentation as cider, but it does not afford the same indications by which the proper time of racking it off may be ascertained. The thick scum that collects on the surface of cider seldom appears on the juice of the pear, and during the time of suspension of its fermentation the excessive brightness of the former liquor is rarely seen in the latter; but, where the fruit has been regularly ripe, its produce will become moderately clear in a quick time in a few days after it is made, and it should then be drawn off from its gross lees. To prevent an excess of fermentation the same means are used as in making cider, and the liquor is rendered

perfectly bright by isinglass. For this purpose the isinglass should be reduced to small fragments by pounding in a mortar, and afterwards steeped twelve or fourteen hours in a quantity of liquor sufficient to produce its greatest degree of expansion. In this state it must be mixed with a few gallons of the liquor, and stirred till it is diffused and suspended in it; and it is then poured into the cask, and incorporated with the whole by continued agitation for two or three hours. This process should be repeated till the required degree of brightness is obtained, the liquor being each time drawn off on the second or third day from its precipitated lees. About 1½ oz. or 2 ozs. of isinglass are generally put into a cask of 110 gallons at once. Were its mode of action purely mechanical there could be no objection to a larger quantity; but it has also a chemical action on the liquor. It combines with, and carries down, the tannin principle; and hence, during the process of fining, the liquor is deprived of a large portion of its astrinency. This substance is most readily diffused in liquors by boiling; but by this it is dissolved and converted into glue, and its organisation, on which alone its powers of fining depend, is totally destroyed. But when perry can be made sufficiently brown without it, it is better not to use the isinglass, as the liquor is rendered extremely agreeable to the eye by it, but is thought to become more thin and acid by its action. In the after-management of perry the method is the same as that of cider; but it does not bear situations where it is exposed to much change of temperature so well, and its future merit cannot be so well judged of by its present state. In the bottle it almost always retains its good qualities, and in that situation it is best to be put, if it remains sound and perfect, at the conclusion of the first succeeding summer.—(Household Encyclopedia.)

REMARKS.

30th.—Rain before 9 A.M., and after 9 P.M. at night, but very fine between those hours.

October 1st.—Rain all night; but fine morning, and till 3.40 P.M., when it began to rain, continuing more or less all the day and night; thunder at 6.49 and 7 P.M.

2nd.—Fine morning; mock sun E of true sun at 7.12 A.M., and W of true sun also from 7.15 A.M.; heavy rain at noon for a short time; fine double rainbow at 5 P.M.

3rd.—Fine morning, and very pleasant day, though much colder.

4th.—Rain commenced at 9 A.M., and continued till noon; fine afterwards, but cold.

5th.—Fine all day, but more especially so in the early part; fine night.

6th.—Fair morning, but soon clouded over, and the day was dull and cloudy; rough wind at night.

Cooler and a very wet week, the rainfall being nearly 2½ inches.—G. J. SYMONS.

COVENT GARDEN MARKET.—OCTOBER 7.

MARKETS remain steady; the supply of vegetables is, however, falling off, the principal attendance being on the Saturdays. Foreign Grapes large, supplied with other descriptions of continental produce.

From observations taken near London during forty-three years, the average day temperature of the week is 59.19; and its night temperature 40.3. The greatest heat was 74, on the 15th, 1812; and the lowest cold 20°, on the 21st, 1812. The greatest fall of rain was 1.04 inch.

ADAPTING ONESELF TO CIRCUMSTANCES— STRAWBERRY CULTURE.

GARDENING would be a very easy affair if it could all be done by rule and line. If all the soils, seasons, and climates were alike we should not need twenty or thirty years' apprenticeship under various conditions to get acquainted with the rudiments of our profession; the merest tyro in possession of a well-written calendar of operations and a clear head would be nearly on a level with the oldest practitioner. Certain work done

at certain times and in one particular manner would produce certain results on a day pre-arranged by the writer. Whether we should be any better or happier if our numerous little excitements and disappointments were all removed I am not prepared to say; but as things are, it is very plain that he is the best gardener who can best adapt himself to circumstances. Read the calendars certainly. I read all, including those of villa and suburban gardening, and although both villas and suburbs are far away from me I always find some little hint that is likely to be of service to me; but in reading, one should know and bear in mind the circumstances under which the writer is placed, remembering that under different conditions if the directions given are fully carried out the result will sometimes be utter failure, or, to say the least, labour will be needlessly wasted. Mr. Douglas, for instance, than whom a more painstaking calendar-writer could not exist, tells us that Strawberries succeed best with him when the beds are renewed every year; and all who know Mr. Douglas know that he would not recommend a thing to be done in a manner he had not experimented on, and which he did not think he had conclusively proved to be the best plan. On the other hand, Dr. Roden, whom everybody knows to be a successful raiser and grower of Strawberries, says (a little too harshly, I think) that either Mr. Douglas's cultivation or his soil is at fault. Now it is very plain to me, and to all who read Mr. Douglas's articles carefully, where the fault is. It is in the soil, and many a man with such a soil would give up the attempt to grow Strawberries altogether. Such, however, is not the policy of a good gardener: he battles against his disadvantages, overcomes seeming impossibilities, and not only grows fruit, but actually grows it better than his neighbours who have every possible advantage, and who, consequently, do not bestow the same amount of care and skill. Tell an enthusiastic lover of his profession that a thing is next to impossible, and you are certain to have it done well.

Now I have the advantage of commanding the best Strawberry soil I ever saw—possibly Dr. Roden's soil is somewhat similar—enormous crops of good fruit are annually produced if no particular attention is bestowed on the plants; but, of course, a little attention properly given makes an improvement in quality. Like Mr. Douglas, I find the finest fruit produced on one-year-old plants, and if I had not a good Strawberry soil I should

be inclined to renew every year, but in my clayey loam the fruit is much more abundant, although not quite so large the second and third year. After the third or fourth year the flavour begins to deteriorate, as well as the size. The total weight of fruit, perhaps, increases as the plants get older and larger, but we do not grow Strawberries any more than Gooseberries solely for weight.

My practice is to plant some afresh every year, and destroy all that can be spared of those that are three years old. A great many forced plants are also utilised and produce good results for a couple of years.

A clayey soil where Strawberries have not been grown before produces the best flavour as well as the finest fruit. I have, however, found one exception to this. There is one very popular Strawberry that I could not get a respectable dish of fruit off for two or three years; it grew tremendously, and produced leafstalks half a yard long, but no fruit worth looking at—it was President. I read in "our Journal" that it was a good variety for forcing. I tried it, and the results were even worse than those obtained out of doors. There is a patch of ground at one corner of our garden which lies high above the rest, and which at some time long ago has been made up with a lot of sand and peaty soil for growing American plants. The President was impeached and banished to this sterile spot, and the result was remarkable. Every season it produces most abundantly, and keeps up a succession of prime fruit for fully three weeks. This last dry summer was no exception, and the ground was never once watered. I have tried other kinds along with it on the light soil, but have not yet found another one succeed. I think, therefore, I am quite safe in recommending those whose soil is too light for other Strawberries to give President a trial. I do not know a Strawberry of better quality.—WILLIAM TAYLOR.

ABOUT MELONS.

I SUSPECT many besides Mr. Meacock have found Melons which answer their purpose better than the "everybody-pleasing Victory of Bath." What is the good of it to the amateur with a cold frame or pit with a very limited supply of materials for heat, or none at all? Will it grow in a frame or pit upon a spent hotbed which has been employed for striking cuttings and forwarding plants from seed? Will it set its fruit, grow to a good size, and ripen perfectly without any heat afterwards beyond that afforded by the sun? Is it for those who have unlimited means for heat, so free a setter, so early a ripener? Will it swell so well late in autumn and winter, and keep for so many days in good condition after being ripe, as the Melon which Mr. Gilbert seeks to disparage—viz., Little Heath, which, if not its equal in pleasing everybody with its flavour, is more than its match in hardness, free-bearing, appearance, and general usefulness? "Everybody," as I accept the term employed by Mr. Gilbert, represents the greatest number, and not the greatest means. What is the number of those growing Melons in frames or pits

with but gentle warmth at first to give the plants a start, as compared with those growing them in pits or houses with heat throughout? Scores, nay hundreds, can afford to grow Melons if it can be accomplished—as it is with Little Heath—in a frame or pit which has been placed over a hotbed for raising plants from cuttings or seeds; but if they have nothing better to do it with than Victory of Bath, they will have long to sigh for the flavour “pleasing everybody.” The latter variety is of no use for cool treatment, but Little Heath is.

Flavour in Melons, what is it, and how does it come? Of kind? If it results from kind, why is it not fixed? The highest flavoured always are so, at every exhibition taking off first honours. How are we to reconcile ourselves to flavour existing one season in the new varieties, whilst in another we find it in the old? If flavour results from kind, how is it that not one of the new equals the old? The flavour must either be lost in the crossing and recrossing resorted to, or alleged, or it cannot be transmitted by any act on the part of the most skilful and experienced operator. Judgment, backed by long experience and close careful observation, can and has effected great variation from the original, in most instances resulting in improvement in some way, but it is seldom we have any improvement in flavour. Let anyone grow all the new kinds, whose name is legion, and compare them with the old, flavour to be the test of merit. Put the round green-flesh, and the oval green-flesh as well, against the Egyptian, selecting its best form, Bailey's Green-flesh; put the white and yellow oval forms, or round, against the Persian, taking Meredith's Cashmere as the best form; put all the scarlet-fleshed against Scarlet Gem, which is the best form of the old true Small-scarlet Scarlet or Red-flesh, and then tell us which of the new ones with their admixture of Cantaloup, Rock, and other blood, is equal in flavour to any of those named? We shall by a trial such as this be able to arrive at a solution of the great question, Which is possessed of the best flavour? Not till then shall I set much value on the effusions of Melon-raisers.

By accident rather than design have originated our best-flavoured Melons and other fruits. The *modus operandi* of imparting flavour remains to be revealed. High or ill flavour is in each kind to be found in the superior and inferior treatment to which it is subjected, but no one can give to a poor-flavoured sort flavour surpassing the original. Subjects of high flavour occasionally occur and most unexpectedly, often when a very different result is anticipated. I may mention a case in point. I have grown, I think, every kind of Melon at one time or other, and tested most for flavour—the “everybody-pleasing” Victory of Bath not excepted, not one of them satisfying in all points, and especially in flavour. Not before this year did I attempt anything with Melon-crossing. I had some old sorts which I thought might be useful, and amongst them fished out Mounsdon's Moreton Hall, which I did not wish to lose. Last time it was sown (four years ago), its accompanying plant in a two-light frame was to the best of my recollection Will's Oulton Park Hybrid. Both are scarlet or salmon-fleshed, Moreton Hall oval, and Oulton Park round. The fruit of the kind sown for Moreton Hall this year is roundish-oval—more round than oval, and the flesh a compound of salmon, green, yellow, and white. It was only moderately netted, and slightly high coloured (yellow), on the side next the sun. I was surprised on cutting it, and more so when taking a thin slice, to find what I had got. That one taste was enough. Others not unacquainted with the flavour of Melons, said upon the first taste that it was the best they ever tried, so rich and juicy. I attempted to cross it with other kinds, but the flower refused the foreign pollen, and the pollen applied to other varieties was equally ineffective. A correspondent of this Journal sent me two or three years ago from Haddington or its neighbourhood a few seeds of a scarlet-fleshed Melon, having the recommendation of its not being subject to cracking when approaching ripening. Its form the first year I had it was oval, slightly netted, thick short footstalk, rind thin, white, mottled with green, and hard; flesh thick, melting, and well-flavoured, colour scarlet. It was a free grower, not a free setter, and the fruit did not crack. Now this Melon has in the present year a fruit nearly round, slightly netted, and the flesh is not scarlet but green with a tinge of red in the cavity of the seed. The kind was raised upwards of thirty years ago, if I remember rightly, and is not in commerce. The flavour is not improved, but if this should meet the eye of the correspondent who sent it, I will gladly give him a few seeds of this Melon in its altered form.

Now, will anyone explain to me why these Melons should change from scarlet to green flesh? Why should these two have green flesh and not Read's, Duke of Edinburgh, and Cirencester Prize? Some agent had been at work, no doubt. What can it have been? Crossing? If so, and the change from scarlet flesh to green gave flavour to one, why not to the other? In conclusion I will name a few varieties. These are—

SCARLET-FLESHED.

Little Heath, succeeding in a cold frame with a little heat at starting, or without it. It is scarlet-fleshed, and not despicable in flavour. Valuable also for early and late work.

**Read's*, very free setting, of good size, round, handsome, finely netted, without ribs.

Duke of Edinburgh, oval, moderately netted, slightly ribbed, large, and handsome; rind mottled.

GREEN-FLESHED.

Colston Bassett, round, moderately netted, medium size, free bearing, flesh very pale green, nearly white.

Victory of Bath (Gilbert's), very handsome, round, free-bearing.

**Cashmere* (Meredith's and Gilbert's), fine, oval; well-known.

Royal Horticultural Prize, oval, free-bearing, thin rind, flesh thick, melting, and rich.

WHITE-FLESHED.

**Golden Gem*, round, very handsome, large, and luscious flavour.

Queen Emma, oval, large, and handsome. It may be said to be an improved Hackfall Hybrid, but that kind is excellent and very free-bearing. Both are large.

I have omitted Scarlet Gem and Beechwood; the latter when true is one of the best green-fleshed kinds, and it has remained longer in the seed lists than many, and it will again come to the front, if we have it not already in a round, large, finely-netted kind in a new guise. Bailey's Green-fleshed I have also omitted, as it is too much ribbed; without its ribs, and with its high flavour, it would be simply unapproachable.—G. ABBEY.

ZONAL GERANIUMS FOR AUTUMN DECORATION INDOORS.

In October it is difficult to cut many presentable flowers from beds or borders, chilly autumn rains with frosty nights having placed their mark upon the outdoor garden. Nevertheless, flowers will be wanted, and they are, I think, more enjoyed then than when there are so many to be seen around. In October, and till the Chrysanthemums come in, it is generally a trying time to keep vases filled, but zonal Geraniums have so well filled-up the gap for me, that a note on the subject may be of service to others. For diversity and brightness of colour, to say nothing of the ease of culture, there are few plants equal to them; no green fly, thrips, mealy bug, mildew, or scale troubles them or takes up their grower's time. Neither do they require peat brought from Kent, or sand from Bedfordshire. Use turf cut from an old pasture, or parings from the sides of the road, stacked in narrow ridges, with a layer of rotten manure between every 3-inch layer of sods. To this, when a twelvemonth old, add a little sand or grit, also some leaf mould if the turf has little fibre. My soil is miserably poor, no fibre in it, and I use a little bone dust and some wood ashes, which appear to give a better colour to the flowers.

I take off my cuttings in spring for autumn flowering, so as to avoid diminishing any of the summer bloom, which would be inevitable if I took them in time to have them rooted before the cold damp days and long nights came. In the beginning of March, having a little Cucumber pit at work, a sandy mixture is prepared, some 3-inch pots well crooked, and in each of these one cutting is inserted and labelled with its name. The cuttings are placed on a shelf in the pit, slightly shaded, and carefully watered till rooted. As soon as the roots show freely round the outside of the ball the plants are shifted into 5-inch pots, using the compost mentioned above. Those not so well rooted go into 4-inch pots. Sometimes they are potted while in the Cucumber pit; sometimes they are hardened off a little and put in theinery. It is immaterial which mode is adopted. If I am late I pot them and keep them in the pit. Beware of too much heat, and they must have abundance of water. Do not saturate the soil on the one hand, nor, on the other, keep them so dry as to cause flagging. A very common practice is to pot and remove the plants to another place. This gives

* These are the best of each colour, the selection being restricted to one kind.

them two checks. Gradually harden them off, and remove to a cold frame by the middle of May, and from the frame to an open position out of doors, or, as mine are for want of a better place, to the sunny side of a walk. By this time they are ready for a shift into their blooming pots, which are 7 inches in diameter, as for our houses these are the most useful, with a few smaller for the front rows.

Throughout the summer the plants should be looked over and all flowers picked off, stopping any gross shoots that may need it. Few, however, require stopping if the flowers are kept picked off. They branch much more freely, forming neat little specimens without the aid of stakes or wire, showing the natural habit of the plant, and giving in October two or three dozen heads of blooms, and some produce more, according to the variety.

Give the plants plenty of water throughout the summer, and let them have full exposure to the sun and dew. By September they will have their pots full of roots, and their wood firm and well ripened. About the first week of the month they are removed to a pit where a crop of Melons has been grown; here they have plenty of air night and day, the flower buds are no longer picked off, and once a-week liquid manure (guano generally) is given. Never apply liquid manure to a plant when dry; water it first with clear water. Many hundreds of plants are spoiled by neglect of this little precaution. For ten days or a fortnight they are watered overhead through the rose to counteract the dryness of the air under glass. When they show flower freely they receive more liquid manure, and are removed to the greenhouse. Here they produce a fine display of bright-coloured flowers when things outside look anything but cheerful. By giving the plants a little heat just to keep the air dry and moving they will continue in flower till Christmas.

Amateurs who have but a small house in which *Chrysanthemums* take up much room, will find that zonal *Geraniums* treated in this way will enable them to keep their house gay in the dullest months until the earliest *Primulas* and *Cyclamens* come in, the same temperature suiting all. The main evil to guard against is damp; therefore the ventilators should always be open a little night and day, giving also a little fire heat, which will make the house all the more enjoyable.

After blooming, the plants are set thickly together in the vinery, and in March the cuttings are taken off and the old plants cut back. After they have commenced to grow they are shaken out and repotted in the same size of pot, and used to decorate the greenhouse in summer and to fill vases for outdoor embellishment.—W.

NOVELTIES IN THE ROYAL GARDENS, KEW.

SONCHUS LACINIATUS, an arborescent Thistle from the Cape de Verd Islands, is much to be recommended for table decoration. There are several plants in the Cape house. Plants grown with a single stem are best, the leaves arch gracefully, are pectinate and oblong in outline, of a pale green, with a midrib nearly white. It is grown from cuttings, selecting the small side shoots that can be taken off with a heel. They should be kept cool at first, but after a time slight heat is beneficial. Though many consider it a rule that cuttings should be given a higher temperature than the plants from which they were taken had been accustomed to, it is found that cuttings with difficulty rooted sometimes strike better if allowed the same, or even a little lower degree of heat. The reason for this appears evident. With cool treatment they are not excited to increased action, with consequent demand for nourishment, as they are when subjected to heat, in which case they may be exhausted before roots can be formed.

Young plants of *Grevillea robusta*, the Silk Oak of Australia, are very valuable for decorative purposes, illustrated by several plants in the conservatory. They are best raised from seed, which may be sown in April with bottom heat. Handsome plants may be grown in two years, having large Fern-like leaves, and which, when cut, are useful from their durability and elegance—qualities that suggest its use for subtropical effect. The soil may consist of equal parts loam and peat.

Pancratium speciosum, in the Palm house, is one of the finest things in flower. It has magnificent heads of pure white flowers, with long narrow segments. In habit it is much like the *Enchais*. The flowers are as ornamental when attached to the plant, but are not so generally useful when cut. Rich loam is the best soil that can be used. The bulbs may be grown singly, or several together. The same culture as for *Enchais* may be applied with success.

In the herbaceous ground a large proportion of the *Asters* are in flower, of which there is a fine collection. *A. Chapmani* is one of the best, and is also little known. It is of merit sufficient for a choice selection. The stems attain a height of 1 to 5 feet, and bear lilac flowers.

FOSTER'S WHITE SEEDLING GRAPE.

Foster's White Seedling is described by nurserymen as the offspring of the Royal Muscadine, and similar to its parent, but superior in appearance, flavour, habit, and season. One nurseryman, though, calls this Vine White Lady Downe's, an *alias* for its proper name. Of course he does not mean the White Lady Downe's of late introduction, said to be raised from the Black Lady of that title. The nurseryman I mention appears to apply the name of White Lady Downe's to Foster's White Seedling from a similar observation, probably, to my own; for I have observed Foster's White Seedling to ripen later than its reputed parent both in fruit and wood; in fact much the same as Lady Downe's ripens, and to hang, too, not dissimilar to the latter in duration. Some time ago I also noticed a writer in the *Journal* mention Foster's White Seedling as a Grape hanging well, but I made no note of reference, much as the passing thought impressed my mind.

Can you or any of your readers tell us if the nurseryman I have mentioned and I are right in our conception of Foster's White as a White Lady Downe's in ripening and hanging properties, thus differing from the Royal Muscadine in these features?—READER.

THE FLOWER BEDS AT THE CRYSTAL PALACE.—No. 1.

THAT the Managers of the Crystal Palace do recognise the fact that something more than the provision of amusement for the people is expected from them, and show by their measures that they seek to attract the attention of men of thought and culture as well as that of the mere sightseer, is an undoubted fact. Faults and errors there may be in many of its parts and features; but these things, it must in common fairness be granted, are inseparable from such a gigantic institution, and to what extent they prevail must always remain a matter of opinion. Of course there are art rules by which such things may be tried, but then it is too often found that self-constituted critics are very apt to ignore rules, and boldly to resolve questions of taste from their own point of view.

Among the many beautiful objects at the Crystal Palace which are a great and decided success, the flower gardens, of which it is my particular province now to treat, have always filled a prominent position, ranking so high among our best gardens that annual reports of their arrangement and general appearance have always been expected and welcomed. But more than this: all who could, have visited the gardens year by year to seek instruction and to cultivate a knowledge of plants old and new, as well as of their arrangement. Knowing this, it was with much pleasure that I found decided evidence of improvement in the arrangement of the beds as well as of the plants; but still there is the old grievance of which I in common with other reporters have before had to complain—the plants are unnamed. Now, why is this? It may be that the presence of labels is regarded as a disfigurement, but this could of course be set aside by using very small labels of a neat if not elegant pattern, and so rendering the colour-combinations as instructive as they are beautiful. Of the general desire for this trifling concession there can be no doubt, for besides several groups of undoubted "blue aprons" in deep and earnest contemplation over the more striking beds, several persons applied to me for names while notetaking, showing by their remarks that they had evidently a wish to know all about the plants with which such wonderful enamelling could be wrought out, for the beds are certainly very beautiful, the panel or carpet style predominating, the whole of the designs being marked with geometrical precision, and composed almost entirely of plants having ornamental foliage.

It has already been shown what great importance is attached to the circular beds at Battersea, and here at the Palace the value of circles, and the facilities which they afford for an almost endless variety of designs, especially of an intricate character, is clearly demonstrated. The favourite succulent here for an edging is *Sempervivum californicum*, one row only being used with excellent effect. Golden Feather *Pyrethrum* is more used than any other yellow-leaved plant, and for

carpet bedding it appears quite indispensable. That it is worthy of this high position there can be no doubt, for apart from its great intrinsic value, the ease and facility with which a large stock may be raised from seed without artificial heat, places this unique plant at the disposal of everybody. Blue is the only important colour of which the blossom has a monopoly, all others being beautifully developed in the foliage. This fact, no doubt, caused the Lobelia to be found in all designs where blue was required, and the plants of it were generally in excellent condition, being healthy, full of bloom, and of a nice even growth—evidence that more than ordinary care and painstaking had been devoted to their selection and management. I allude to this because the Lobelias in many places have not been good this year; it may be that this is owing in some measure to the use of many of the worthless varieties which have been sent out during the last year or two. A really good strain of the true old *speciosa* is the best and safest kind to use, and all the newer introductions ought certainly to be tested more than once before they are introduced into a design. *Coleus Verschaffeltii* and *Alternanthera versicolor*, with others, such as *amona*, were in every group where crimson deep or bright, or carmine, was required, and undoubtedly with the best effect, for there was great richness and beauty combined with a quiet refinement of tone in every combination; not that this result was by any means owing to plants of one particular colour, but rather to the judicious selection and tasteful combination of several. Soft grey was not so prominent here as at Battersea, or rather I should say it was not much used in the carpet beds. By-the-by, why not term it enamel bedding? It is a much more expressive term for such artistic work. Feathery Fern-like masses and lines of greenery were used instead of grey to give tone and softness to those designs wherein bright colours most prevailed. Our old friend *Tagetes signata* *pumila* was the plant selected for this purpose, the growth being kept to a uniform height, and every flower kept picked off with such jealous care, that it was only by a very close inspection I could detect even a few buds, and these were being removed. Treated in this way it forms masses and bands of a lovely and novel character, and which have only to be seen to be appreciated. It was a good many years ago that I tried to produce a somewhat similar effect with *Geranium denticulatum*, but neither that nor any other can at all compare with the *Tagetes* for such a purpose. Of course it is not used for an outer row, all the beds here being on turf with which it would clash, but for a second row or central mass nothing can be more telling.—EDWARD LUCKHURST.

VINE CULTURE.

WEIGHT OF CROP, THINNING, DISBUDDING, &c.—Cropping Vines too heavily is a prevailing error in Grape-growing. Presuming that the rafter is—say, 24 feet long; that the young Vines are to bear to a third of this length the first year, and that the Vines show more than a bunch to each shoot—remove them all but one to a shoot as soon as they are far enough advanced to be got hold of; and after the berries are set—presuming that the bunches are large, as they generally are in young Vines—remove all but four bunches on every rod. This will leave eight bunches on a Vine. Of course, the largest and most shapely are generally left; and in most cases it may be presumed they will average at least 2 lbs. or more. This is crop sufficient for the first year in the case of permanent Vines. None of these bunches should be left on the leading shoots, which should not be stopped this year till they reach the top of the house. When the Vines are in full bearing, 14 lb. of Grapes to every foot run of the main stem of the Vine may be regarded as a fair crop.

In disbudding the side growths of young Vines, due regard must be had to a regular establishment of permanent fruiting points or spurs. From 16 to 18 inches apart will be enough; and this will generally call for the removal of two buds for every one left all along the main stem. These side fruit-bearing growths should be stopped two or three joints beyond the bunch that is left. This, generally speaking, will give foliage sufficient to clothe the whole roof, when the main stems are trained 3 feet apart. If there is room for a more lengthened growth, it should be allowed to those from which the bunches are all taken off. This gives foliage enough to sustain the Vines in vigour. Closer stopping has a tendency to weaken the Vines in time. Allow the lateral growths which spring from the axils of the leaves of these fruit-bearing shoots to form one leaf, and stop them, and do not allow them to

make more growth the whole season. A less number of large well-developed leaves is preferable to a greater number in a crowded condition.

As soon as the shoots can be tied down without fear of their breaking, carefully bring them down till they can be tied to the under sides of the wires. This operation must not be attempted at once. They must be brought down by degrees, beginning with them when their points have nearly touched the glass. Even when they can be tied down safely at one time, they frequently force themselves off the main stem in the course of a few hours. Shorten the laterals on the portion of the main stem which is not bearing to one leaf when the wood has become brown.

In thinning off the bunches to the number directed, make a partial thinning when the shoots are tied down, and the final thinning when they are out of bloom, except in the case of Muscats, the thinning of which should be left till it can be seen which bunches have set their berries most regularly. The thinning of the berries should take place, in the case of Humbergs and all free-setting sorts, as soon as the berries attain the size of Radish seeds. But with the shy-setting sorts it is best to delay their thinning till they are larger, and it can be seen which are properly fertilised and which are not.

SPUR-PRUNING FOR NEXT SEASON'S CROP.—It is now very generally admitted that the close-spur system of pruning is the best—i.e., to cut back this season's fruit-bearing growth to within an eye or bud of the main stem. In each succeeding year the pruning takes place back to the single bud at the base of last season's bearing growth. As the Vines get older, a cluster of buds generally forms at the spur, notwithstanding this close pruning. Only the strongest of those that grow are left to bear fruit. This close pruning is much preferable to leaving two or three eyes. Not only can the Vines be maintained for a longer time in a more manageable and slightly condition, but they yield more compact serviceable bunches, that swell their berries better than those long and looser bunches generally produced from buds further from the main stem. Prune, especially Vines to be forced early, immediately they have shed all their leaves. The wounds should always be dressed with styptic to prevent any chance of bleeding. When in the course of time spurs get long and unsightly, a portion of them can be cut right back to within an inch of the main stem, and the adventitious buds there will break again and form fruit-bearing wood. By cutting back a certain number annually, they can thus be kept within bounds, or young rods can be brought away from the bottoms of the Vines, and the old ones cut out altogether.

TRAINING.—With regard to the extension system of training, by which a Vine is made to fill a whole house, there can be no objection to it, provided a border extending away from the front of the viney in proportion to the extension of the branches can be secured for that large range which an immense Vine, filling, it may be, one large house, requires for its roots. This condition secured, there can be no objection urged against what is called the extension system. Another matter to be taken into consideration is, that a Vine having its roots extending to an immense border area is less under control, especially for early forcing. All things considered, I prefer in a general way a compromise between the one-rod and the extension system; and think that a Vine limited to two main rods is, in by far the majority of cases, more under the control of the cultivator, and best adapted for early forcing.

For the supply of summer and autumn Grapes, there can be no objection to filling a house with a Vine or two, provided that a run of border congenial to them can conveniently be provided for such large Vines. In some localities where the viney is set down in a soil naturally congenial, there is little difficulty in this respect. But in the majority of cases the border has to be artificially prepared and limited; under such circumstances, it is better to restrict the Vines to two or three rods.—D. THOMSON (in *The Gardener*).

JASMINE FRUITING.

ADMIRAL SIR FREDERICK GREY, Lynwood, Sunningdale, Staines, informs us that the Jasmine plants trained on the walls of his house have this year borne fruit, and as this appears to occur but rarely, he should be glad to know if plants have seeded in other places.

The aspect of the house is S.S.E. Four plants have fruit on them, one to the E.N.E., one to the S.S.E., and two on the wall facing the W.S.W. This wall is sheltered by a con-

servatory from the north-west and north, and it is on it that the fruit is most plentiful, a great many sprays having from four to nine berries on them. They are about the size of a pea, of a shining green colour, beautifully clear and transparent. They are now beginning to turn to a dark olive, and probably will turn darker as they ripen.

Sir F. Grey has not found anyone who has before seen the fruit, and if desired would forward a spray with the berries on it. He is told that London mentions that a plant at Bayswater seeded in 1836.

ROSES ON THE BRIAR STOCK.

IN common with other enthusiastic Rose-growers I greedily devour every scrap of news which appears from time to time in "our Journal" relative to our favourite flower.

I was glad to see a letter from Mr. Dodds, of Kelso, upon the method he adopts with the Briar, as I firmly believe he has hit upon the right one, and one not generally known, or at least adopted by Rose-growers, so far as I know. I have never known it adopted in this country, although I have made frequent inquiries both from amateurs and nurserymen, and almost considered it to be a method confined to myself. I can speak with a degree of confidence in the matter, for I have treated my Briars in the way Mr. Dodds describes for the past seven or eight years, although I never heard of its being practised till it occurred to me to try it, and I now work all my Roses on the Briar in this way, fully believing it to supersede all other stocks for the Rose. I may say I have fully tested all other stocks and plans, but give a decided preference to the Briar.

When I first commenced to grow Roses in my own small way I knew little about them, but being passionately fond of them I experimented in every conceivable manner, and by buying, begging, and exchanging I have now a fair stock of as healthy vigorous standards as one would see at any place. The great secret in having good vigorous heads, is to have plenty of roots; this is the reason growers naturally go to Roses on the Manetti or on their own roots; it is not, I believe, any intrinsic superiority in the latter two. But give me a nice clean Briar with plenty of fine fibrous roots, and I will show you as much vigour and health, and far larger and better-developed flowers, than can be produced on any other stock.

The method I have adopted for some years is this (and I would like our enthusiastic friend Mr. Cumm to give me his opinion, and if he has not tried it to begin at once):—In September and October I go through the fields, and select my Briars—good, long, straight, stout shoots of this year's growth, taking care that they are well ripened, and I either pull them off the parent stock, as you would do a slip, or cut them with some sharp instrument. The hard ring of wood at the bottom of the slip, where it is attached to the stem, must be preserved intact, for if this be torn or detached from the wood it will not take root. Cut them all of an equal length, whatever height you want your standard. I make them all about 2 feet, as I like a short standard. Have your ground deeply dug, and plant them in rows 1 foot apart and 6 inches deep. I then put down a stout stake at each end of the row, and tie two ropes to one stake, and twist these ropes in and out round every stock, and make it firm to the other stake; this keeps them firm in the ground, and from being bent with the wind or other causes. These will throw out side shoots next spring, and be ready for budding on in July or August. I generally transplant them once before finally removing them to permanent beds, so as to get plenty of roots. Thus, instead of having big, thick, ugly roots with a few sickly fibres, as is the case where Briars are dug up by the roots in the first instance, you have a nice straight stem, with a bunch of beautiful, fine, fibrous roots, which will throw plenty of vigour into the heads. I should say that I find in selecting Briars, those having red bark and plenty of prickles are more vigorous than the pale yellow, and I prefer those of medium thickness, about as thick as the index finger.—JOHN TURTLE, *Peacefield, Portadown.*

STORING FILBERTS, WALNUTS, &c.

It is sometimes difficult to get good wine, if even a high price be paid, and the accompaniment of good-flavoured Nuts is equally a matter of uncertainty. I have therefore sent you a sample of Cob Nuts which were gathered dry last October, spread-out in the sun for a few hours with the husks on, and then packed in a box in layers with tolerably-rotted cocoa

refuse about as moist as ordinary potting soil; the whole well pressed down as packed, and kept in a cool wine cellar. I have followed this plan successfully for several years, and have found the flavour of the Nuts so preserved to be excellent. When they are required for use all that is necessary is to take out the quantity desired, and again press down closely the remainder. The Nuts when taken out should be slightly dried in the air, and the refuse will then shake out and leave the Nuts clean and equal to those fresh gathered. Walnuts should be husked and dried for a somewhat longer period in the sun before being packed. Nuts without the cocoa refuse, but otherwise similarly and concurrently treated as the sample sent you, are now all bad.

It is advisable not to have the refuse too moist, as on one occasion from this cause I found a perfect forest of miniature Filbert and Walnut trees in my cellar in the spring after the Nuts were stored, the whole having vegetated at the growing period. The method is cleanly, and the refuse does not impart an earthy taste, as in the case of Nuts kept in the ground.

—T. LAXTON, *Stamford.*

[The Nuts received from Mr. Laxton were as fresh as if they had been newly gathered. Speaking from the example before us we can strongly recommend the practice adopted by Mr. Laxton.—EDS.]

NOOKS OF SUSSEX.—No. 1.

NEVER will you receive a sentence written by me at Brighton or any other visitor-thronged town. If I hear that a friend is gone to a nook such as I like to nestle in, that nook is barred against me until he and his belongings have thence departed. When I escape for a change, it is for a change total—new faces, new scenes, new topics, and new commissariat. I would as soon remain in Tooley Street as be either in a section of London by the seaside, or in a lane walking with a London acquaintance talking of woollens, and dining upon an economical leg of mutton. Scenes and pastures new for me, and the more intensely contrasted with everyday life the more enjoyable. It is only in out-of-the-way nooks that total novelties are come at. I am in one such nook, and its nearest town—but a small one—maintains in life a weekly penny *Times*, and where but in that could be read such a sensational advertisement as in that now before me? The Public Health Commissioners should summon the nurseryman to aid them, for he announces as an undoubted fact that he is selling "THE DISEASE-DESTROYING TREE, so well known for preventing fevers and other diseases." That is his voucher to the Eucalyptus globulus. Again, where but in such nooks as I am straying in could he seen in every lane broods of jolly chickens a month old, and each from twelve to fourteen chicken strong? Do the management, the climate, and the breed combine to secure these best of early poultry for the London market? The breed is the Sussex, so commonly white, irregularly speckled with black, and all Dorking in structure except in not having five claws. There seems no coddling management, and the climate is not so mild as further westward, where chickenhood is much more precarious. Then who would have thought the soil of these nooks was favourable to these youngsters? Why, it is the clayiest of clay, even that known as "the London clay." The past superlatively dry summer did not injure the crops in and about these nooks. I have just trudged between Chichester and Bognor, and make no exception when I say that no finer crops of Turnips are to be found in England.

Bognor: Did any other reader of this Journal ever retire thither? Let no one be affrighted by the name. It has no more relationship to a bog than Hastings has to the Pea so called. *Bucgrenora* was its most ancient name, and its three mid-letters being omitted, the residue, *Bucnora*, was sloped towards its present further corruption; but it passed through an intermediate stage, for in 1327 a fair was established, and a chapel dedicated to St. Bartholemew at "Bogenore." If asked what was meant by the original name, I can only point out that *Buc* was the Beech, and *grenora* intimated vigour. Passing from its etymology, let me observe that it is an improving nook, and for improvement there was abundance of occasion. Its founder, Sir Richard Hotham, was a hatter, and I have come to the conclusion that his vast expenditure on the place originated the proverb, "As mad as a hatter." Wealth and knighthood made him ambitious to create a town that would immortalise his name. He found this nook, spent £160,000 on house-building, called the place "Hothampton," became involved in unsuccessful lawsuits, died broken in spirit, and

his property was sold by auction for £61,000; his residence, Chapel House, with thirty-nine acres realising only £3650. Hothamton was expunged, Bognor remains, and the only permanent record of its founder besides his epitaph in the gallery of South Birsted Church, is a halfpenny token he had struck, found sometimes in numismatic museums, bearing the legend—"Hotham, Hatter."

As Sir Richard was not only a Southwark tradesman but its representative in Parliament, and consequently in constant contact with London aldermen, he may have had his epicurean proclivities intensified, and consequently inclined to Bognor because circled by places so celebrated for dainties, that they were combined into this proverb:—"A Chichester lobster, a Selsea cockle, an Arundel mullet, a Pulborough cel, an Amberley trout, and a Bourn wheatear." To these might be added "Bognor prawns," for I hereby bear testimony to their excellence, and probably at no one place on the English coast are so many caught. In stormy weather when the boats cannot venture out hundreds of prawn-traps may be counted on the sea-wall.

The mentioning Arundel reminds me of the gardens noted during peripatations into the nooks within a semicircle of ten miles between that dukely town and the sea. The cottage gardens are well stocked, and the vegetables superior both in size and quality. The Broccolis are especially excellent. The Potatoes were nearly all stored long since, and the disease is not said to have appeared even slightly. The farmhouses are all large and substantial; the gardens of the olden fashion—large squares enclosed by substantial walls, many retaining the topiaried Yews and Box so generally admired when "William of Holland ruled the land." Many evidences exist of the real fondness for gardening that prevails—conservatories attached to the superior houses, greenhouses even to the minor dwellings; huge many-flowered masses of Pampas Grass in even small gardens, Geraniums bedded-out everywhere, especially in circular beds, having large bushes of Fuchsia coccinea in their centres. These last-named are uninjured in winter; and this reminds me that the climate is so mild that the Tamarisk continues to bloom in winter, and that masses of *Meibomia-nthemum eordifolium* now in flower on a south border near the sea, remain out and uninjured during that season. The very sign of a public-house bears evidence that a fondness for gardening prevails around. I have seen many hostelrys inviting by their sign, "The Shoulder of Mutton;" but nowhere, except at Yapton, in one of these Sussex nooks, did I ever see the sign of "The Shoulder of Mutton and Cucumbers."—G.

STRAWBERRY CULTURE.

I HERE the subject of Strawberry culture will not be allowed to drop yet, and that more of your correspondents will give us the benefit of their experience. I have some plants of the Early Prolific, and find them very early. I gathered a few Strawberries on the 2nd of June last, nearly a fortnight before Keens' Seedling, and the flavour was good. If the plants thrive well this Strawberry will be a valuable acquisition; but I have only had the plants one season, and I can never tell what a Strawberry will do until I have had it two or three years.

I find it impossible to secure a large crop of fruit the first season on our dry soil; the second is generally the best, but not always, and after that the plants live on as long as you like, but the crop is not so good after seven or eight years. Although plants seldom die in the ground, they sometimes wear out in another way after a certain time, seem to get tired of the soil, do not bear well even if you put out young runners, and it is necessary to procure a fresh stock from a distance. My object in Strawberry-growing is to secure a large crop for dessert, and I have found none to beat Trellope's Victoria, with Keens' Seedling to come in before it, and the Elton after it. I have several on trial—viz., President, Sir Joseph Paxton, La Constante, and Myatt's Prolific, and shall on another occasion be able to tell you what I think of them.—AMATEUR, Cirencester.

MAKE YOUR TREES BRANCH LOW.—Train your Pear trees for garden or field use that they will branch at a distance of 1 or 2 feet from the ground. The advantages are easily enumerated:—1, It is easy to trim. 2, It is easy to gather the fruit. 3, Falling fruit is little injured. 4, The branches being sturdy, will not be strained by overbearing or over-weight of fruit.

5, Soil will be kept shady and moist. 6, The trunk will be protected from the scorching sun. 7, The tree will grow more and more beautiful.—(*Horticulturist*.)

PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

INS TECTORUM. *Nat. ord.*, Iridaceæ. *Linn.*, Triandria Monogynia.—Native of Japan. Flowers purple, with darker stripes.—(*Bot. Mag.*, t. 6118.)

GOLPOPELLUM DALANUM. *Nat. ord.*, Orchidaceæ. *Linn.*, Gynandria Monogynia.—Native of Tenasserim. Flowers yellowish green, purple spotted.—(*Ibid.*, t. 6119.)

CINNAMOMUM CORTICISUM. *Nat. ord.*, Canellaceæ. *Linn.*, Dodecandria Monogynia.—Native of the West Indies. Flowers yellow, tipped with crimson. "A well-known West Indian tree, as the Mountain Cinnamon of Jamaica, or Canella bark of that island and St. Thomas, but not the true Brazilian plant of that name, which is its solitary congener, the *C. axillare* of Endlicher. These two very distinct trees were indeed long confounded together, and their bark is still imported under the same name of Canella, and employed largely as an aromatic stimulant to purgatives and tonics, being reputed to be well adapted for debilitated stomachs. The Caribs (ancient natives of the Antilles) and the negroes of the present day employ it as a condiment. As an aromatic, Pereira says that it ranks between cinnamon and cloves. Mr. Hanbury informs me that the bark was exported during the last century as 'Winter's bark,' and is still found in the market; as also that it is probably the 'Wild Cinnamon tree of Sloane, commonly but falsely called Cortex Winteranus,' though the tree that he figures 'Phil. Trans.' xvii., 465 (1693), is certainly *Canella alba*. It is a local plant growing in Jamaica only in mountain woods of the parishes of St. Thomas-in-the-Vale and St. John."—(*Ibid.*, t. 6120.)

DROSER A WHITTAKERI. *Nat. ord.*, Droseraceæ. *Linn.*, Pentandria Pentagynia.—Native of South Australia. Flowers white, but the leaves, green and brown, and haired, are the chief attraction. "This charming little plant was sent to the Royal Botanic Gardens of Edinburgh by Mr. W. A. Mitchell, formerly an *employé* in that establishment, where it was flowered by Mr. McNab in July last, and sent up to Kew for figuring, with a description by my friend Dr. Balfour, who observed that the sepals were reflexed, and the flowers an inch in diameter when well grown and expanded, a statement fully borne out by the dried specimens. The glandular hairs on the leaf are in all respects like those of *D. longifolia*, and act precisely in the same manner on being brought into contact with insects; the leaf itself, however, does not become concave, but retains the remarkable convexity of surface of each half."—(*Ibid.*, t. 6121.)

PENTSTEMON HUMILIS. *Nat. ord.*, Scrophulariaceæ. *Linn.*, Didynamia Angio-permia.—Native of the Rocky Mountains. Flowers dark blue. "It was one of the indefatigable Nuttall's discoveries in the Rocky Mountains, and it has since been gathered by the naturalists attached to various American and English Government exploring expeditions, amongst others by Dr. Lyall, of the Oregon Boundary Commission, who collected it at 7000 feet above the sea, between Fort Colville and the Rocky Mountains in 1867. The plant here represented was sent for figuring by Messrs. Backhouse, of York, who flowered it in June last."—(*Ibid.*, t. 6122.)

BRODIAEA VULBILIS. *Nat. ord.*, Liliaceæ. *Linn.*, Triandria Monogynia.—Native of California. Flowers pink. "It was discovered by Hartweg in the Sacramento Mountains, California, in 1846, and has since been found by various collectors in Sonora and other places. The scape sometimes attains 12 feet in length.

"The plant figured was raised and sent for figuring by Mr. Thompson, of Ipswich, in July of the present year."—(*Ibid.*, t. 6123.)

CLEMATIS, *Stella* and *Fair Rosamond*.—"They were both awarded first-class certificates by the Royal Horticultural Society in 1873, and certainly both well deserved that mark of distinction. They belong, as already mentioned, to the pæneus section, distinguished by its spring-flowering habit and its ternate foliage, and they both have flowers which are very perceptibly fragrant. *Stella* is an eight-sepaled variety, the sepals elliptic oblong and stalkless, so that they form a full solid-looking flower close up to the richly-coloured stamens. The colour is a deep bluish mauve, with a conspicuous bar of reddish plum colour down the centre of each sepal; the filaments are white, and the anthers of a chocolate purple, forming a conspicuous central tuft. *Fair Rosamond* has also eight-

sepaled flowers of the same form and imbricating character as those of *Stella*, but they are of a bluish white colour, and have a more or less distinct wine-red bar extending from the base of the sepals nearly to the apex, but becoming paler upwards; the beauty of this variety is much enhanced by the tuft of deep-coloured stamens which occupies the centre, and which have the filaments purplish red, white at the very base only, the anthers being of a darker purple. The scent in a warm close atmosphere is intermediate between that of *Primroses* and *Violets*, and is almost equal to that of the latter flower. Some idea of its free-blooming character may be formed from the fact that a plant grown over a balloon-shaped trellis 2 feet high, and 1 foot 3 inches through, bore at one time sixty-five of its fine showy blossoms. There can be no doubt that we have here two of the very best of the early-flowering sorts."—(*Florist and Pomologist*, 3 s., vii., 169.)

CYCLAMENS, Royal Purple, Rose Queen, and White Perfection.—“These three of the most advanced varieties are from the superb collection of Henry Little, Esq., of Twickenham. Mr. Little has made a speciality of the *Cyclamen*, and cultivates it in very large numbers, and in a style which, we believe, has always ensured him the first prize wherever he has entered into competition. From early autumn, through the winter, and well on into spring, the earlier months of the year being the height of the blooming season, Mr. Little's *Cyclamen* houses are brilliant with flowers, and possibly there is no other subject which would yield so abundant and so choice a return for the very moderate amount of cultural attention required.”—(*Ibid.*, 181.)

LILIUM AVENACEUM or LILIUM MACULATUM.—“This remarkable distinct Lily was shown at a recent meeting of the Royal Horticultural Society, by G. F. Wilson, Esq., of Weybridge. The plant was about 2 feet high, with distinct whorls of lanceolate leaves an inch wide on the lower part of the stem, near the top of which the leaves became alternate, a rather loose corymbose umbel of five to six flowers crowning the whole. The flowers are very distinct in form, having scarcely any tube, so that the perianth segments spread out immediately above the base; they are elliptic-lanceolate, nearly $1\frac{1}{2}$ inch long, so that the blossoms are fully 3 inches across; and they are of a deep tawny orange colour, with a thickish cluster of black spots towards the base. The flowers are somewhat nodding, but the style makes an angle with the top of the ovary, so as to assume an upward direction. The ovary itself is very deeply six-winged. This Lily is perfectly hardy, being a native of Kamtschatka, Manchuria, the Kurile Islands, and Japan. It was exhibited in flower about the middle of June.”—(*Ibid.*, 193.)

CAMELLIA, Thomas Moore.—“Mr. Williams, of the Victoria Nurseries, Upper Holloway, holds the stock; the foliage is bold, and the flowers are large, regularly imbricated with thick, fleshy, evenly-edged petals, and of a rich deep showy crimson colour, the deepest of any variety in cultivation. These qualities are such as to place it in the front rank amongst modern varieties.”—(*Ibid.*, 205.)

VIOLAS.

I ENTIRELY agree with Mr. Wright as regards the merits and usefulness of *Violas* as garden plants, yet I regret to see one or two self varieties of special merit omitted in his enumeration; but probably they have not come under his notice, as they are new—viz., *Viola Admiration* and *Purple Prince*. I feel sure, as selfs, no variety can surpass them for beauty, profusion of bloom, and size of flowers, and this more especially applies to the first-named, as I think it well deserves to be placed at the head of a list. During my stay the past summer in Mr. Williams's nursery I had a good opportunity of observing them, and of all the *Violas* I ever saw none attracted my attention so much as they did.

Admiration well deserves the name it bears. I feel sure it is excellent for a ribbon border or mixture in beds. The flowers are light blue, of the largest size, and stand well above the foliage. *Purple Prince* is a fine variety as a bedder, flowers not quite so large as those of *Admiration*, but the plant is a free bloomer, the colour very attractive. Although the past summer was very dry and unfavourable to *Violas* retaining their beauty, these varieties stood it well, and had a magnificent appearance.—T. T., *Second Gardener, Barnet.*

LATE PEAS.—R. Hanbury, Esq., of The Poles, Ware, writes on the 9th inst. to say:—“I am now gathering Peas of excellent

flavour from *Little Gem*, which promises to continue some time longer.

EXTRACTS FROM THE REPORT ON THE BRISBANE BOTANIC GARDEN.

THE experimental department of the garden still continues to prove its utility in the introduction and distribution of plants yielding products of commercial value, or which would otherwise be desirable additions to our present limited list of agricultural and horticultural vegetation. Inquiry has been made for some of the medicinal herbs by invalids, and it is gratifying that we are able to supply the demand. The requests for the seeds of fibre-producing plants have been too numerous for me to comply with the whole of them. An indigenous species of *Musa*, or *Banana*, has been known to exist in the north, and I discovered two others whilst with the late expedition. I feel assured that these will produce a fibre at least equal to *Manilla* hemp, and probably superior, as the trees are of a more robust habit than *Musa textilis*.

The demand for *Sugar Cane* continues, and experiments appear to be made in its cultivation in several hitherto untried localities. I am in expectation of receiving from Java cuttings of a number of new varieties, some of which will probably be found suited to the climate and soil of Queensland.

I am still frequently asked for the seeds of dye-producing plants, especially of *Indigo*, for the planters upon the northern rivers. The growth and manufacture of *Indigo* will probably assume the proportions of a valuable and important interest in the tropical regions of the colony, whenever labour can be obtained at a sufficiently cheap rate.

The experimental Coffee plantation has thriven well this year, and its appearance has caused a demand from northern visitors for plants and seeds. Amongst other calls for distribution the principal have been for *Malberry*, *Olive*, *Tea*, *Palm oil*, *Lavender*, *Senna*, *Turkey Rhubarb*, *Cocoa*, *Clove*, *Cinnamon*, *Nutmegs*, *Vanilla*, *Ginger*, *Walnut*, *Hickory Nut*, *Breadfruit*, *Jack*, *Alligator Pear*, *Chinese Date Plum*, *Mangosteen*, *Mango*, *Durian* plants, *American Vine* cuttings, &c.

On account of the dryness of the season at the time of flowering, some of the fruit-bearing trees did not yield as well as in former years—such as the *China Date Plum*, the *Alligator Pear*, the *Custard Apple*, the *Cherimoyer*, &c. On the other hand, the dry weather at the same period was favourable to the *Mango* tree, which produced a more than an average crop. The fructification of the latter is impeded, and that of the first-named fruit tree promoted, by a moderate amount of moisture.

Living plants and seeds have been issued during the year to 513 individuals and establishments, as follows:—61,000 *Sugar Cane* cuttings, 7000 *Coffee* plants, 2300 *Tea* plants, 3000 *Ginger* roots, 300 papers of *Tobacco* seed, 20 lbs. of *Indigo* seed, 50 lbs. of *South Sea Island Cotton* seed, 20 lbs. of *New Orleans Cotton* seed, 10 lbs. of *San Hemp* seed, 10 lbs. of *Jute* seed, 300 *Mango* plants, 358 *Jack* plants, 200 *Chinese Date Plum*, besides 500 packets of seeds, and 11,000 of other useful and ornamental plants. A great demand is springing up for genuine seeds of Australian timber trees from Northern India, California, as well as the Atlantic States, Southern Europe, and other countries. The requisitions made have been complied with as far as possible. I have also supplied a large quantity of roots of *Buffalo Grass* (*Stenotaphrum complanatum*) for binding railway embankments, a purpose for which it is eminently well adapted.

The following list includes the principal plants which have flowered or borne fruit during the past year:—*Cocos flexuosa*, Mart., nine years old; *Enterpe oleracea*, Mart., ten years old; *Oreodoxa regia*, eighteen years old; *Areca horrida*, Rox.; *Macadamia ternifolia*, five years old; *Nephelium lappaceum*, L.; *Artabotrys odoratissima*, R. B.; *Araucaria excelsa*, R. B., fifteen years old, &c.

I would beg to call attention to the expediency of setting apart four hundred acres upon both the Johnstone and the Daintree rivers, these districts offering better advantages, as regards aspect and soil, than the reserve at Cardwell possesses for the cultivation of the *Clove* (*Caryophyllus aromaticus*), the *Nutmeg* (*Myristica mosehata*), the *Vanilla* (*Vanilla aromatica*), the *Cocoa* (*Theobroma Cacao*), the *Coca* (*Erythroxylon Coca*), the *Mangosteen* (*Garcinia Mangostana*), the *Durian* (*Durio zibethinus*), the *Breadfruit* (*Artocarpus incisa*), &c., which require some more degrees of heat and moisture to bring them to perfection than can be had at Cardwell. In fact, with the

vast variety of climate and soil of Queensland, it must of necessity be the case that each locality has a distinct description of vegetation most suited to it.

The reserve proclaimed at Toowoomba, on the Darling Downs, has long been needed for the successful cultivation of plants requiring a much cooler region than the neighborhood of Brisbane. The elevation and aspect are well adapted for the Grape Vine, the Peach, the Apricot, the Nectarine, the Plum, the Cherry, the Apple, the Pear, the Walnut, the Hickory Nut, the Spanish Chestnut, the Hazel Nut, the Jerusalem Filbert, the Fig, the Strawberry, the Hop, and the Orange, not to speak of the various useful and ornamental trees and shrubs that adorn the parks of the old country, such as the Oak, the Horse Chestnut, the Alder, the Birch, the Hornbeam, the Beech, the Guelder Rose, &c. There might be also added many of the trees of North America, such as the glorious Magnolias, and others.

CULTURE OF PEAS.

THE varieties of Peas are legion, and I think it is useless to have sixty or seventy sorts offered by seed-men, when three or four are quite enough for any gardener to grow to keep up a supply from June till October. During the twenty years I was gardener at Gosford I only grew two or three sorts, and used to have Peas some seasons up to the 10th of November. I grow Peas now to send to Edinburgh market; and some years I grew two acres, but not above three-quarters of an acre this season. The sort I grew for early work this year was Kentish Invicta, which I find better than Sangster's No. 1. I am told Multum-in-Parvo is the best early Pea, but I do not know it.

The Pea I have grown for a late crop for twenty-five years is Lynn's Black-eyed Marrow, the only Pea I know with a black eye, and I have seen no Pea to surpass it. It grows 4 feet high, is a branching sort, is not apt to mildew, bears profusely, and is sweet, and the pods fill well, though not so large as Veitch's Perfection; but with me it bears far better, and will retain its flavour till nearly ripe. If the soil is suitable for Peas it may be planted 4 to 6 inches between each pea; if sown thickly they are sure to rot, or will not bear well. I introduced this Pea to Scotland thirty-two years ago from Hackney. I got a quart of it sent by the mail coach, and when I saw it in a bearing state I kept all for seed, and have grown it ever since. I think Little Gem (Macleay's) a very useful sort. I sowed about 1000 square yards of it on the 15th of July, 20 inches between the rows, and now (October 13th), I could pull a quantity fit for table, and it is blooming in great style. I enclose a pod of it. It requires no stakes; and as a rule I do not believe in staking Peas. I sowed Lynn's Pea this year on 7th May, and on the 3rd of this month I pulled twenty pecks on one day.

From my own experience I would say to those who want a supply of Peas from June till October, if they sow the best early Pea known, and at the same time Maclean's Advancer and Lynn's, and then go on with the latter till the end of April, they will not regret it. I have tried Carter's G. F. Wilson beside Lynn's; but I prefer the latter, and I like to stick to an old friend till he deceives me.—JOHN ADDISON, Ormiston, Tranent, N.B.

FLOWERS FOR OUR BORDERS.—No. 42.

FORSYTHIA VIRIDISSIMA.—DEEP GREEN FORSYTHIA.

Among the numerous valuable plants discovered by Mr. Fortune on his first visit to China, and subsequently introduced to this country, two are remarkable for the profusion of their large yellow flowers, produced, in the case of one, in the very heart of winter, and in that of the other in early spring. We allude to *Jasminum nudiflorum* and *Forsythia viridissima*. It is doubtless some drawback on the merits of these fine shrubs, that in both the blossoms appear before the leaves; but winter flowers are so acceptable, even when, as in these instances, unaccompanied by their usual leafy attendants, that this circumstance has not prevented them from attaining a considerable place in the estimation of the public. Both are highly ornamental objects for a wall when this can be spared, for although the shrubs themselves are quite hardy, the flowers of the *Forsythia* sometimes suffer from severe frost when grown as a bush or standard, as in the case of many winter-flowering plants; and the shoots of the *Jasmine* are of such tenuity, that some support is rendered necessary by this circumstance alone.

Forsythia viridissima is a free-growing shrub, reaching ulti-

mately the height of 8 feet, or even more, with somewhat angular branches, which when mature are of a dark brown tint. The leaves are opposite, generally lance-shaped, acute, and toothed at the margin from the middle upwards, but entire near the base; they are, when full grown, of a clear deep green colour, to which circumstance the specific name alludes. In the axils of each leaf a small bud is formed, which, as the autumn advances, becomes gradually more conspicuous, until, when the leaves have fallen, these buds assume so prominent an aspect as to form a marked feature in its winter physiognomy. They remain dormant until March, when they gradually unfold themselves and disclose a profusion of large bright yellow blossoms, emitting a delicate balsamic odour, in which respect they have an advantage over those of the *Jasminum nudiflorum*, which are scentless. The flowers are produced sometimes in pairs, but often singly, on short footstalks so slender that the blossoms are generally drooping; they are, as already intimated, of considerable size, somewhat campanulate in form, with a short tube plaited within, and a limb cleft into four spreading obtuse segments. The stamens are two in number, with filaments so short that they are quite concealed in the tube.

Fig. 100.—*Forsythia viridissima*.

The *Forsythia* is easily cultivated, and as easily increased, the most ready mode of propagating it being by layers; but cuttings of the ripened wood about a foot or more long, taken off in autumn and planted in sandy loam, will root freely.

A soil of this character is also best suited for established plants; in rich moist earth it produces long-jointed shoots, and continues its growth later in autumn than is compatible with the due maturation of the wood. A situation against a wall is to be preferred for it, because in this position the shoots will be subjected to a greater amount of heat, which will materially assist the ripening process. It cannot be too often repeated that in this consists the whole art and mystery of acclimatizing the plants of warmer regions than our own, though in this instance we have to deal with a plant from a district where the winters are certainly much more severe than in any part of Great Britain. The summers are, however, of an equally extreme character, and the shrubs and other plants of the north of China are therefore well prepared by the roasting they undergo to endure the subsequent reduction of temperature. As a further illustration of this principle, we may remark that in the neighbourhood of New York, where, as our readers know, the winters are of a rigorous nature, the *Forsythia* flowers freely as a bush or standard, and this is to be

attributed solely to the elimination of all watery juices by the warmth of an American summer.

This mention of standards reminds us that the Forsythia grown in this form has, when in flower, an extremely interesting effect, especially if planted amidst shrubs of an evergreen character. When grown as a bush, an exposed situation should be avoided; a warm corner, or a south exposition, sheltered by tall evergreens, will protect the flowers from the cutting March winds, and preserve them in beauty for a longer period.

The Forsythia blooms whilst comparatively small. It was introduced, as we have already stated, from China in 1815 by Mr. Fortune, who discovered it in company with the beautiful *Weigela rosea* in the garden of a mandarin near Tinghae, and subsequently growing wild in the province of Chekiang.

One other species is in cultivation, *F. suspensa*, from Japan, but is less frequently met with in gardens than the foregoing, though of earlier introduction. It was on this species that the genus was first founded, in honour of William Forsyth, a horticulturist of some note, formerly gardener at Kensington Palace.—(*W. Thompson's English Flower Garden, Revised by the Author.*)

THE LABOUR OF FRUIT CULTURE.

SPEAKING of planting fruit, the remark is often made that "it is no use to set out trees; they do no good any more in these parts;" and yet it is beyond dispute that there is no country on the face of the globe that in this respect can beat this one. The fact is, we have been spoiled by the very abundance of our riches. Time once was when all one had to do was to stick in a tree and leave the rest to nature. Immense crops resulted from this simple plan without any effort on the part of the fruit-grower. Nowhere else could this be done. By the sweat of one's brow is he to labour, not only for his daily bread, but for his fruit also. No one could expect this Eden-like dispensation to last. Bags and blight are sure to find out the fruit trees, and one has to battle with them in order to succeed in America as well as elsewhere.

It is very remarkable that those in daily communication with the soil, as fruit-growers and gardeners, should expect fruit trees to grow without some care. Look at the labour required to grow the commonest farm crops. Besides the horse labour, and the wear and tear of machinery, and the cost of manure, one has to walk some eighteen miles after the plough in order to get an acre of wheat-land ready for sowing; and yet with all this hard work and heavy expense, the profit is often not more than 10 dols. an acre. It is so of all farm and garden crops. Everyone knows that the labour is enormous—hoeing, digging, working away for ever.

Fruit culture, to be successful, requires some expense and some labour; but it requires not nearly as much labour as many other kinds of things do; and in proportion to the labour, the profits are generally greater.

It is one of the lessons our folks have to learn, that the day when Nature took care of our fruits for us, and gave us full crops without trouble or care, is gone by. Fruit-growing takes its stand now with all other things. It will yield good returns with ordinary care. He who does not yet know this, and calculates to do as his fathers did, had better leave fruit trees alone.—T. MEEHAN (in *Forney's Weekly Press*).

NEW BOOK.

Notice sur quelques Espèces et Variétés de Lis, &c. Par J. II. KRELAGE.

THE beautiful and varied tribe of Lily has of late come so much into favour, that any work on the subject must have an interest to many horticulturists. The little brochure named above can hardly be designated as a work, but is simply an example of the extreme care with which many of the foreign nurserymen enter into their cultures, a care which is emulated by many in our own country.

Messrs. Krelage & Son of Haarlem are well known for the extent of their bulb cultures; and the little book, of which this is the first part, is intended to give a detailed scientific and popular account of the many varieties of Lilies cultivated by them. It contains a well-drawn and coloured plate of *Lilium Wittei* and several characteristic woodcuts, and is mainly occupied with descriptions of *Lilium Thunbergianum* and its varieties, *Lilium Humboldtii*, *Lilium tigrinum*, and *Lilium Wittei*. With regard to this latter, it seems very doubtful

whether it is not a white form of *auratum*, somewhat more prized but not really more different than many of the varieties one sees in very large collections of imported bulbs. Indeed the whole question of some of these Japan Lilies is involved in doubt, some believing that *auratum* itself is but a variety, while *Krameri* bears sufficient analogy to it to make it doubtful as to its being really a distinct species.

Lilium Wittei, we learn, was flowered first in the gardens of M. Van Leuwen at Rotterdam in 1867; it was offered to an English house afterwards, by whom, I daresay, it was believed to be only an *auratum*, and ultimately bought by Messrs. Krelage, who say it is so scarce that it will be some time before it can be offered for sale. It is not, however, because the "Grapes are sour" that I venture to question if people will care very much for that.

An interesting and chatty chapter on *L. Thunbergianum* flore-pleno occupies the first place. We are given curious heraldic and poetic notes on the tribe, while a very exhaustive botanic treatise exhibits much care and research. In it we are told that Parry sings of it—

"The Lily, more noble and more brilliant still,
Its form majestic to heaven uprears,
King of the gardens, this favourite of Flora
Charms us at once by its perfume and beauty."

While De Boisjolin says—

"Noble child of the sun, thou Lily majestic!
Towards thy parent orb, which dazzles thee not,
Lift with true pride thy sovereign form:
Thou king of the flowers, the Rose is thy queen!"

But we are not only treated to poetry, but given good, sound, solid, practical teaching, and the whole brochure may be regarded as a fitting adjunct to the carefully prepared little treatise of Messrs. Teutschel & Co., of Colchester. To one who, like myself, has been long an admirer of these lovely tribes—who can look on the time when I first bloomed the lancifolium section, when the price was two guineas a bulb—who was a witness of the sensation occasioned by the appearance of *Lilium auratum*—it is a matter of hearty congratulation to see it coming once more to the front, and to admire the beautiful additions being so constantly made to our gardens and the increase to our stores of information.—D., *Deal*.

NOTES AND GLEANINGS.

MESSRS. VEITCH & SONS have issued a coloured plate representing their new Tea Rose DUCHESS OF EDINBURGH, which is an excellent representation of the original, and conveys a good idea of what that charming Rose is like.

— In some portions of the country RUST ON BLACKBERRIES is becoming quite common. It arises, perhaps, from want of a full supply of food in connection with the hygrometric condition of the atmosphere, and the only remedy that suggests itself is good culture, thinning-out the plants, and mulching well with leaf mould and manure, or muck and manure, or manure alone. A sure remedy is the removal and burning of the diseased bushes.—(*Canada Farmer*.)

— THERE is a Currant bush at Rochester, New Hampshire, which, though growing among the branches of an Elm 20 feet from the ground, has borne well for more than a dozen years.

— JAMES DOUGALL, of Amherstburgh, sent specimens of a NEW SEEDLING CHERRY to the meeting of the State Pomological Society at Adrian, Michigan, which will be likely to prove valuable if its good qualities are maintained in other localities. The fruit is black, and the specimens averaged by measurement three-fourths of an inch in diameter, and were of good quality. The best ones had been previously picked, and those sent were hardly full-sized. Mr. Dougall stated that this new sort ripened uniformly a week earlier than Early Purple Gean on trees standing side by side.—(*Canada Farmer*.)

— THERE were 20,500 packages of fruit shipped from Benton Harbour, Michigan, on September 2nd.

FLAVOUR OF CALIFORNIAN APPLES.—The *Pacific Rural Press*, in a recent article, says:—But with regard to Californian Apples there can, we think, be but one opinion—namely, that they are, in a remarkable degree, lacking in strength and variety of flavour. Apple consumers here universally acknowledge it, and so little is expected from Californian Apples in this respect that the growers give little consideration to the question of flavour;

and as a consequence of this indifference, in regard to all fruit qualities excepting size and beauty, varieties have become so confused that dealers, and even producers, scarcely know what they are selling, further than that they are Apples.

THE INDIAN FIG.

THIS, the Cactus *Opuntia* of botanists, is one of the cosmopolitan plants, for we have seen it growing in the open air of Europe, Africa, and Asia, and know those who have seen it similarly thriving both in South and North America.

Our earliest writer on plants, Lyte, knew little about it, for although in 1578 he published a tolerable woodcut of it, he had no more to say relatively than that it is "a strange kind of plants which cometh fourth of one leaf set in the ground, and sometimes it groweth high, and is named of Plinio, *Opuntia*, now in these dayes *Ficus indica*"—that is, the Indian Fig, a popular name it still retains.

Gerarde tried in 1583 to induce it to bear fruit, but, he adds, "never as yet, although I have bestowed great pains and cost in keeping it from the injury of our cold climatic."

We now know that on this plant the Cochineal insect is reared, but Johnson who edited a later edition of Gerarde's 'Herbal,' thought that these insects were transformations of the plant's substance. He says, "Upon this plant in some parts of the West Indies grow certain excrecences which, in continuance of time, turn into insects, and these outgrowings are that high-prized Cochenell wherewith they dye colours in graine." This error was soon dispelled, and the true history of the Cochineal insect and its cultivation were made known.

We have seen at the Cape of Good Hope hedges entirely formed of this plant, and most formidable opponents they were to anyone attempting to pass through them.

In the "Botanical Magazine," t. 2393, there is a coloured portrait of this Cactus and its yellow flower, with this notice appended:—"Cactus *Opuntia* is a native of America, and although now indigenous in many parts of the south of Europe, and in Barbary, was probably originally brought from thence.

"This species is sufficiently hardy to bear our winters without protection, provided it is planted in a dry soil. It is well suited to ornament rockwork, in which situation, in the Chelsea gardens, the plant from which our drawing was taken has stood several years."

"Flowers in June and July. Propagated by the articulations."

HEATING BY GAS.

As a partner in an old-established house which has from time to time supplied hundreds, and I may say thousands, of gas boilers for heating apparatus, will you allow me to ask your correspondent (see page 322) where

"the *couleur-de-rose* advertisements and flattering reports" that he refers to appear? I am afraid his failure arises more from the insufficiency of heating surface exposed in the house by using 1-inch pipes than the gas apparatus itself. He does not say the height of the house 8 feet 4 inches by 7 feet wide. If we suppose it is an average of 8 feet 6 inches high, I would advise his using at least 60 feet of 2-inch pipe if to be heated by an improved form of gas boiler with atmospheric burner. Your correspondent and readers generally must not forget, as a set-off against cost of gas, the little or no trouble necessary in attending to a gas stove for small houses compared with cleaning, lighting, and night stoking of a boiler for coal or coke. I do not advocate a gas stove where there is convenience for stokehole and flue for a boiler for coke; but as there are hundreds of small conservatories where no other than a gas stove or boiler can be used, I do not see that the cost of gas should be made such a "scare-crow" as

FIG. 101.—THE INDIAN FIG.

your correspondent thinks it is.—R. S. D.

THE BEDDING IN THE ROYAL HORTICULTURAL SOCIETY'S GARDEN, SOUTH KENSINGTON.

GOOD as the bedding display has been in former years, it has this season been equal to that of any previous season, and better in regard to beauty and variety. With a proper play of colour, variety of form, and an harmonious relation throughout, the effect is rich and pleasing. Neutral colours have been largely used and properly arranged; and to maintain the popularity of bedding a change was needed, for people had become tired of for ever seeing beds of scarlet and yellow wherever they went; the public taste has considerably improved, and people now appreciate soft colours in flowers and foliage judiciously combined, and even foliage plants alone for bedding are becoming the first fashion. It is no wonder; for when they are nicely arranged, and contrasted with care

and good taste, they are very effective, and may successfully assert the first position in the parterre.

The design at the top of the large central walk in the Royal Horticultural Society's Garden at South Kensington consists of a series of beds round a large circular one (fig. 102), with a jardineite in the centre of it. This is a very pretty piece of colouring, and a happy combination of foliage and flowers, which the design and the description of the plants used will show. In another part of the garden there is a long border at the foot of a wall (fig. 103), and it looks like a waving ribbon. It is richly ornamented with choice plants arranged in an artistic and elegant manner, as the design will explain.—N. COLE, *Kensington Gardens*.

THE NARCISSUS AS A BORDER FLOWER.

ONE of your correspondents recently alluded to *Narcissus poeticus*, the common Pheasant's Eye Daffodil of gardens, as being well worth general culture, an opinion which I can readily endorse. It is one of the most beautiful and fragrant of all hardy flowers, and poets and painters alike have done it honour for ages past. It should find a place in every shrubby border; or grown in masses, it forms a beautiful object on the lawn, or such portions of it as are not mown until the autumn. It does not, however, appear to be generally known that bulbs of this species force well if they are taken up late in the year, and potted in any light rich soil. Another remarkable fact is, that these bulbs flower better the second year they are forced than the first, so that they should not be thrown away after the first year's crop of flowers is obtained, as is generally the case with bulbs that are forced. Early flowers thus obtained are valuable, as in beauty and fragrance they hold their own with the choicest of all cut flowers. The sort generally used for forcing is *N. Tazetta*, a very variable plant, native of the south of Europe, some of the most beautiful and distinct varieties being found on the borders of the Mediterranean. This is the plant so largely imported and sold by our nurserymen about this season of the year under such names as *Staten General*, *Grand Primo*, *Soleil d'Or*, and *Paper White*. The colour of the flowers varies from pure translucent white to rich golden yellow, while the corona or cup of some forms is of a rich orange tint, bordering on vermilion. This plant, although generally forced in pots, flowers well in glasses of water, like the *Hyacinth*, while it does well planted out on a warm, moist, sheltered border, and so treated flowers later than the forced plants, so that a succession of flowers may by this latter plan be obtained. A striking peculiarity of this and all the other species of *Narcissus* is, that their flowers last fresh a long time in water. I have had cut spikes in a vase of water for a fortnight, or even longer, and the latest flowers were then quite fresh. It was formerly the custom of some of the florists near London to grow beds of this plant (*N. Tazetta*) out of doors for the sake of their flowers in spring, and the flower-spikes were cut from the plants as soon as the first buds had attained their full size. When so gathered, they bear packing better than when the flowers are fully open, and the blooms never fail to open out in succession when placed in water, and flower as well as if left on the plants, or even better, as the flowers suffer from the winds and rains of the spring months. Those who force these beautiful plants should retain the bulbs, and plant them out in a warm border after flowering, as, when so treated, they will in most cases flower well in after years.

N. Pseudo-Narcissus, the common yellow Daffodil, is supposed to be a native of this country, and with its many varieties (both double and single), is well worth border cultivation. It is capable of producing fine effects when planted in masses, a fact noted by several of our poets from Herrick to Wordsworth, and all lovers of hardy flowers should not fail to read the celebrated ode to Daffodils of the last-named author, which is one of the most interesting and suggestive rural poems in the English language. *N. biflorus* is another reputed native, generally bearing two white flowers on a scape among its wax-like glaucous foliage. It is nearly related to *N. poeticus*, but is readily distinguished by the absence of the purple or crimson ring round the margin of the cup. *N. gracilis*, and its beautiful variety, *N. gracilis tenuior*, also resemble the last in the shape of the flower, and in having a saucer-shaped cup; but the colour is a clear yellow, and the leaves, instead of being glaucous and flat, are semi-cylindrical, and of a vivid shining green colour, nearly like those of the *Jonquil* section. *N. incomparabilis* is a stately species, well worth a place, its

flowers varying from deep yellow with an orange-margined cup, to pure white with a lemon cup. The flowers are solitary, on stout scapes, 16 to 18 inches high—the flowers being about 3 inches in diameter. There are two or three very distinct and beautiful double-flowered varieties of this plant, the flowers of which are very showy, and these should find a place in every herbaceous border. One of these has white segments, partly encompassed in a glowing orange nectary or cup, and is the Double Orange Phoenix of old florists and gardeners. A yellow form with a deep orange cup is the Sulphur Phoenix, and there is another still paler form than either, very beautiful, although now seldom seen in cultivation. The flowers of these are nearly as double as a Rose, and so heavy that they require some support to prevent them bending to the earth. A white-flowered kind, somewhat similar to the last, has nodding white flowers, with a cylindrical cup; this is *N. poeciliformis* or *N. montanus* of gardens, and is interesting to botanists and amateurs on account of its flowers being rarely perfect, having often only three or four segments instead of six; and the drooping character of the flower is very distinct from any other species, and serves to distinguish it from the last-named plant.

The gem of the whole genus is *N. triandrus*, a pale sulphur-yellow-flowered plant with from two to five flowers on a scape, and deep green rush-like leaves. This has recently been reintroduced to cultivation, and is one of the prettiest in the whole group. The segments of the perianth are reflexed so as to give the flower the appearance of a yellow Cyclamen or Dodecatheon rather than a Daffodil. The flowers of this species are very delicate in structure, yet it has proved to be one of the hardiest, and withstands sun and rain better than most of the others. *N. Jonquilla*, the common Jonquil, is well known as a border plant, its bright yellow flowers being borne in clusters on slender scapes among a tuft of deep, glossy green, rush-like leaves. It forces well, and its fragrant flowers are always welcome for the flower vase in early spring. Nearly related to this plant, but with larger flowers, is *N. odoratus*, or *Campanelle*, a showy plant largely grown in some old market gardens for the sake of its deep golden sweet-scented flowers. Like the last-named species, it is often met with in the double state; but all its forms are beautiful, and it well deserves more general culture. *N. juncifolius* is a pigmy only an inch or two in height, bearing two or three pale yellow flowers on a slender scape. The flowers somewhat resemble those of *N. Jonquilla*, but the cup is very much larger in proportion to the size of the flower. It is not showy, but deserves a corner in every garden where choice hardy bulbs are appreciated. Of all the *Narcissus*, however, there are few better than *N. Bulbocodium*, the flooped Petticoat Daffodil of gardens, which often flowers almost before it frees itself of the surrounding earth, each flower glowing like burnished gold. This does remarkably well in pots for conservatory and greenhouse decoration, and it should be grown in quantity everywhere. Of all hardy flowers, if we except the Broom, we know of none of a richer yellow colour than this species. A variety (*N. monophyllus*) with white flowers comes from Algeria, but it does not grow so freely as the yellow-flowered form. All the varieties of this plant are tender, and often perish during cold wet winters unless the beds are raised slightly above the general level, and the bulbs protected by a mulching of dung or leaves. I hope ere long to see these beautiful old flowers more generally grown than is at present the case. They have been grown in English gardens for the last two or three centuries; and Parkinson, in his "*Paradisus Terrestris*," published in 1629, enumerates no less than ninety-six species and varieties as being then in cultivation in London gardens.—F. W. B. (in *The Gardener*).

THE WOOD OF THE CHESTNUT TREE possesses the property of not altering in bulk when exposed to heat or moisture. For this reason it is useful for the manufacture of casks for wine or other fluids. It also possesses the advantage of not giving any disagreeable taste to the liquid contained in it. It may also be used instead of Oak bark or logwood for tanning leather and making ink. The wood of the Horse Chestnut is said to be so like the wainscot Oak, that only those who are accustomed to work these woods can detect the difference. The fruit of the Horse Chestnut when ground into powder makes an excellent paste for shoemakers and bookbinders. It is employed in Turkey as a food for horses, especially when troubled with short breath or cough. They also give it to

cows, to increase the amount of milk they yield. The prickly husks of the Horse Chestnut are also useful for tanning leather. —(From *Cassell's Household Guide* for October.)

NOTES ON VILLA AND SUBURBAN GARDENING.

Hyacinths, Tulips, and Other Bulbs.—In performing my promise given last week that I would refer to the Hyacinth and a few other sorts of bulbs, I may say that among the many different subjects that one might name as suitable for the decoration of the window or of the town conservatory none can excel, taking all points into consideration, the Hyacinth, Tulip, Crocus, Snowdrop, Scilla sibirica, and some other bulbs. Their qualification of thriving in the smoky atmosphere of large towns and the ease with which they may be cultivated in addition, as well as the certainty with which they flower under ordinary conditions—at a time of year, too, when flowers are most appreciated, give them a very high position. The Hyacinth and Tulip, as well as the Crocus, may be obtained in very many different colours; but for general culture I think my readers are likely to prefer the primary or most decided or distinct rather than the intermediate shades, although one's fancy may be indulged in if desired, for they are all cheap alike.

Among *Single White Hyacinths* there are Alba Maxima, Grand Vainqueur, Lord Grey, Queen Victoria, Grand Vidette, and Tubifera. *Double White.*—Anna Maria, Triumph Blandina, La Tour d'Auvergne, Don Grastuit, Sceptre d'Or, and La Virginité. *Single Red.*—Amy, L'Ami du Cour, Mars, Robert Steiger, Norma, and Lord Wellington. *Double Red.*—Grootvoorst, Waterloo, Regina Victoria, Panorama, Czar Nicholas, and Bouquet Royal. *Double Blue.*—Bloksberg, Richard Steel, Laurens Koster (a grand colour), Bride of Lammermoor, Albion, and Prince of Saxe Weimar. *Single Blue.*—Charles Dickens, Bleu Mourant, Baron von Tuyl, Couronne de Celle, Emicus, and L'Ami du Cœur. Besides the above, which will do for glasses as well as pots, there are some sorts in yellow or approaching that colour, also lilac, and some very dark, but I have found many of these to be delicate; and, again, they are more expensive because the colours are more rare.

Among Tulips there are the single ones, such as the early Duc Van Thol in several colours, and Pottebakker, white and yellow; Vermillon Brillant; Yellow Prince; Duc de Brabant, crimson with yellow blotch; Donna Maria, white feathered with crimson. Double sorts.—Rex Rubrorum, red, and a close double sort; La Candeur, white; Duc Van Thol, red and yellow; Duke of York; Tournesol, red and yellow; and Purple Crown. As to Crocuses, Large Dutch, yellow; David Rizzio, pale; Sir Walter Scott, white, blue stripe; Cloth of Gold, yellow with a black stripe; Queen Victoria, white; and Ne Plus Ultra, blue and white.

I must not forget the Polyanthus Narcissus, of which there are Grand Monarque, Soleil d'Or, Double Roman, States General, Yellow Prince, and Paper White. Above I mentioned the pretty dwarf-growing Scilla sibirica, a very bright blue; then there are several others, such as Scilla amona, also a blue, and some in other colours. In Snowdrops there is not much variety, there being only a single and double white tipped with green, and very pretty they are.

Having now given a list of the different bulbs I will make a few remarks upon their cultivation. In the first place, those selected for glasses ought to be put in them immediately, and those for pot culture before the month is out; for although they may be planted up to as late as Christmas it is much better to have them in early, as such things must first make root before the top begins to grow, and if they are late in being planted very often the leaf shows as soon as the root begins to grow, and they do not when that is the case flower half so well. It is true that when many bulbs are grown it may be advisable, in order to have a succession and late bloom, to pot some portion of them later on.

Now for the general treatment, taking those for glasses first. Procure rain water if possible, and fill the glasses just so full that when the bulbs are placed on the top of them it but just touches it. The glasses may then be placed away in a dark cupboard or cellar for a few weeks, or until the bulbs begin to grow, then take them out, and gradually let them have the light. When they are in full growth let them have all the air and sunlight possible without giving them a check by extremes. As the water diminishes fill up the glass to the height at first started upon. They will flower remarkably well either in the window or on the mantelshelf, as well as in the conservatory, though their proper place seems to be in the rooms rather than in the other places. For those grown in pots but a common sort of soil is needed, such as loam of a turfy nature, if possible with sand added, and about one-fourth part rotten manure. I have grown them very fairly for ordinary purposes with loam and sand only, but then they have had a liberal supply of liquid-manure water when growing fast towards flowering. Drain the pots thoroughly, and cover the drainage with some of the rough pieces of soil, to prevent the finer portions from running down

and stopping the passage of water. The bulbs may be grown in from 5 to 8-inch pots; if the former one bulb in a pot will suffice, if the latter size three will look better. Each bulb should be placed in the pot so that the top of it can be seen out of the soil; make tolerably firm about it to keep it in its place, and the soil under the bulb ought not to be pressed too tightly at first, for in time it will become solid of itself.

The directions as to soil and manner of potting apply to all the sorts of bulbs named above, but of course the Crocuses and other small bulbs may be planted thickly in order to make a better show in each pot.

After all the bulbs are potted take them to a sheltered place in the garden, place the pots on a bed of coal ashes, or, if not to be obtained, fine stones or gravel; but then as the worms are likely to work up through the stones into the pot, each one ought to stand on a piece of slate or tile to prevent the ingress of such enemies. Afterwards cover the whole of the pots with some sort of fine material; first, however, cover each bulb with a small pot, and plunge the pots deeply enough to cover the whole; when doing so those wanted out first for forcing should be placed at one end, and their position denoted by a large label; this will save much trouble. Let them remain here for a month or six weeks, protecting against frost if it comes. When taking them out to start into growth they should at first be gradually inured to the light, and be placed in a cool part of the house or frame, and gradually worked into a higher temperature, and as they grow give them a position near the glass, and afford plenty of air; water they must have frequently, their roots are very fleshy, and therefore require to be kept moist, especially when growing so fast. When they reach the blooming stage they will last much longer if taken to a more airy part of the house or room.

I ought to have said that the situation where the pots are placed should be high and dry, so that the water from the heavy rains may pass away quickly; and again, in potting the bulb I generally put some sand around it, which sometimes prevents rotting, when from circumstances there is an inclination that way. From the fact that the bulb when potted is in a dormant state, and about to be plunged in a moist soil out of doors, it must not have any water after potting. I know that has in many cases induced decay in the bulb.—THOMAS RECORD.

DOINGS OF THE LAST AND PRESENT WEEKS.

HARDY FRUIT GARDEN.

SOME time has been devoted to making the garden tidy, by weeding walks and clearing off weeds and withered leaves, which latter accumulate on the borders, and are blown by the winds into corners and against the Box edgings. Some of the Cherry trees have become badly gummed, and as it would be of no use to try any method of cure with trees that are far gone, they have been dug out, and the places will be planted with young trees. Cherry trees as standards or pyramids are beautiful objects when in blossom, but it is a rare sight to see a tree laden with ripe fruit. The Cherry is more attractive to our feathered friends than any other fruit, and the only chance of saving the produce is to net closely. Before planting trees on the same ground it is quite essential to success to trench the ground 2 or 3 feet deep, and if exhausted to incorporate some rotted manure with it; a barrowload or more of fresh mould should be placed round the roots when planting the trees, not omitting to mulch the surface with rotted manure, which should not be removed in the spring, but allowed to remain until it is washed away by the rains. If it is desirable to secure a north aspect for growing vegetables, it is much more necessary to have such a position for planting such fruits as will succeed there. In the south of England Plums of the better sorts and even Apricots have been obtained from a north wall in dry hot seasons, the main value being that the fruit was ripe when that from a more favoured position was gathered. It ought not to be forgotten that the Morello Cherry succeeds quite as well on a north wall as it does anywhere else.

By training Red, Black, and White Currants to the walls, the season of these useful fruits is to a great extent prolonged. The Gooseberry season can also be prolonged if the trees are trained to the north walls, or if planted as dwarf bushes on the borders. Mr. Whitton, the clever gardener at Thirlstane Castle, Lauder, N.B., is still gathering Warrington and Hedgehog Gooseberries from trained and dwarf bushes. The trained trees are grown against the north wall in the same manner as Currant trees. Two growths are trained right and left in a horizontal position, and about a foot from the surface of the ground. From these growths others are trained vertically and equidistant, so that when the wall is covered with bearing wood, as it is in the course of a few years, the wisdom of this method of training is at once apparent.

Many persons adopt the old method of managing Strawberries—that is, to plant the runners in beds in August 3 or 4 inches apart, and then to plant out in the kitchen-garden quarters in October. The plants should be put out at once, so that they may become established before winter. It is not expected that these

plants should bear fruit next year; usually all runners and flowers produced are pinched off as they are formed. Of course such a system cannot be recommended, as a season is lost. On heavy soils such plants produce very large crops the first year that they are allowed to fruit.

FRUIT AND FORCING HOUSES.

Vinerics.—The late houses where Grapes are hanging require constant attention, as, owing to the heavy rainfall, the berries are much more liable to mould now than they will be a month hence when the leaves are removed from the Vines. The houses are ventilated as soon as the day is sufficiently advanced to dispel the damp, and the heating apparatus is warmed and allowed to cool down again before the house is shut up at night; the ventilators should be closed at night to keep the damp out. All mouldy berries should be cut out as soon as they are perceived, as one mouldy berry, if allowed to remain, will spoil a whole bunch in a few days. We do not keep any plants in the houses, except such as do not require water.

We have pruned the Vines in the early houses, and are now washing the woodwork with warm rain water in which just a little soft soap has been dissolved; strong soapy water brings the paint off the wood, it is also injurious to the glass, which should be washed with clean water. The next operation is to wash the Vines also with soapy water, but before doing so all superfluous bark is removed with the thumb nail and finger. Many persons strip the Vine to the quick, which is wrong, as it exposes the thin inner bark to the action of the atmosphere, and the sun may also act upon it injuriously. The rods are now dressed with the mixture which has been recommended in previous numbers. It may not be necessary to remove any of the soil from the outside borders, but we take about 3 inches from the surface inside, and replace it with the previously prepared rich compost—that is, if the borders are rather poor, for it is a mistake to feed the Vines when they do not require food; such treatment will give large berries, but the first quality—flavour, will be wanting. Another object gained by removing the surface soil is, that all the eggs or larvae of insects are taken out that may be contained in it. The fresh compost should be trodden in firmly with the feet, or pressed down with the hands in corners where the feet cannot reach it. The outside borders merely require a dressing of manure, which is lightly forked in.

Eugenia Ugni.—Many persons hold this in esteem as a desert fruit. It was brought into notice very nearly twenty years ago with a great flourish of trumpets. On the strength of leading articles in some of the horticultural papers many persons bought plants, and it was grown far and wide both as a pot plant and on low walls in a warm position. It has not secured much public favour in either way; but when well grown in pots in a warm greenhouse the fruit is quite as large as the largest Black Currants, and the flavour is very pleasant. The plant is readily propagated from cuttings, and will bear a few fruits the second year. With proper treatment, in four or five years large bushes may be formed, and we never yet saw a failure. The potting material should be turfy loam torn-up by the hand, added to which is a fourth part of leaf mould and a sixth of rotted stable manure; the spent droppings of a Mushroom house answer as well as any other. It will succeed either in sunshine or shade.

Passiflora edulis.—We have gathered this for the dessert from stray plants put out in the plant stove; and as the fruit hangs for some time in good condition after it is ripe, it is often available for extra dishes when such are required to make up the table. At Drumlanrig Castle a lean-to forcing house is devoted to it, and from the trellis overhead at present hang hundreds of ripe and ripening fruit, each as large as a hen's egg. It is in great request there for dessert purposes. Its great enemy is mealy bug, which breeds rapidly in it, so that if a plant is cultivated in the stove it ought to be in a position where it can be syringed daily. The plant makes roots very freely, and hence must either be grown in a very large pot, or, what is much better, planted out in the border of the house. The same potting material answers for this as for *Eugenia*.

Melon and Cucumber Houses.—Getting ready plants for producing early spring Cucumbers. Varieties that do not produce seeds freely are grown here, and to keep up a true stock propagation is effected mostly by cuttings; and what is at present noteworthy is the difficulty—nay, the impossibility—of keeping the plants in life more than four or five months in our light sandy soil. In medium loam we have had no difficulty in keeping the plants growing for nearly twelve months. The glass had become dirty during the summer months, and must now be cleansed at all events. To keep the plants in a healthy growing condition they must have all the light possible, and as much air as can be admitted during the day in fine weather. Melons ripening should have a dry atmosphere and air admitted freely, with a temperature of 60° at night, and a rise of 10° or 15° by day.

PLANT STOVE.

Unless in warm days we do not syringe any of the occupants of this structure now, and water is applied with caution to the

roots. *Calanthe vestita lutea* and *rubra* are in flower, and are very useful for decorative purposes, as so few of the Orchid family are at present in bloom. Thinning-out any climbers that are obscuring the light from plants underneath, and cleansing the glass from dirt, which does little or no harm in summer, but it ought to be removed now.—J. DOUGLAS.

PROVINCIAL HORTICULTURAL EXHIBITIONS.

[SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held. Although we cannot report them fully, we shall readily note anything especially excellent, and we wish for information on such specialities to be sent to us.]

TO CORRESPONDENTS.

* * All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

BOOKS (H. W. W.).—The work you name is published by T. Drew, 13, University Street, London, W.C. The price is 8s. 6d., but the edition is out of print. (J. L.).—"Florist's Flowers," to be had at our office, price 3d.

PAMPAS GRASS (C. W.).—Your Pampas Grass with 124 spikes of flowers upon it is no doubt a handsome specimen. It is not unusual for the plant to grow so large.

GRASSES (H. Lee).—Nos. 3, 7, 8, 11 are not annual.

YUCCA FLOWERING (Robertson).—It will in all probability die after flowering, but from the base will arise suckers, one or more, so that you need not have any fear of losing the plant. Other crowns will come, from which you will have flowers in due time.

ANNUALS TO FLOWER IN SPRING IN GREENHOUSE (R. S. P.).—The seeds should be sown in 4-in. pots, scattering them thinly over the surface, and be covered lightly, about the diameter of the seeds, with fine soil. Sandy fibrous loam, with a third part of leaf soil or old manure, and a free admixture of sand, will grow them well. When they are an inch high they should be thinned to that distance apart, leaving the strongest, and about a fortnight after thinning they may be shifted into 6-in. pots. They should have the highest and most airy position, watering carefully. *Asperula azurea setosa*, *cartolina aurea*, *Calandrinia umbellata*, *Campanula carpatica*, *Candytuft*, sweet-scented, *Clarkia pulchella*, and vars. *alba* and *marginata flore pleno*, *Collinsia bicolor*, *C. grandiflora*, *C. verna*, *Gilia tricolor* *rosae splendens*, *Godetia roseo-alba*, *Gypsophila elegans*, *Kaulfussia amelloides*, *Lasthenia californica*, *Leptochiton densiflorus*, and variety *albus*, *Linaria bipartita splendens*, *Lupinus nanus*, *Mignonette*, *Nemophilas attonaria*, *insidius*, *maculata*, *Nolana atriplicifolia*, *Platystemon californicus*, *Silene pendula*, and vars. *compacta*, *ruberrima*, *Venus's Looking-glass*, blue, *Viscaria oculata*, and *Whitlavia grandiflora*.

WINTERING HOLLYBUCKS, ROSE CUTTINGS, AND BEDDING GERANIUMS (St. Edmund).—Your garden being walled, we should plunge the Hollybuck and Rose cuttings in pots in ashes in a sheltered corner to the rims of the pots, and shelter them in very severe weather with mats placed on stakes, or a little hay or dry litter will answer as well, removing it whenever the weather is mild. The base of the south-east aspect will be best. The Geranium cuttings will winter safely on broad shelves in the kitchen window if you take care to see that they have air whenever the weather is favourable, and keep them duly supplied with water. Having shutters it is hardly likely your plants would suffer from frost, but on a cold night you could keep on a gentle fire. We think it is more from the drying heat that your plants will suffer than from cold. With care, however, we think you will succeed. We know a case of several hundred cuttings being wintered in kitchen windows.

WINTERING BEDDING GERANIUMS IN PROPAGATING FRAME (F. L.).—As you have no provision for affording top heat, it will unduly excite the plants into growth, especially at the roots, which ought not to have a higher temperature than 55° to 60°. Could you not expose the tank on both sides, say 3 couple of inches, so as to allow of the heat passing more freely from the tank's surface to the atmosphere? This would probably give you all the top heat you require, which should be from 40° to 45°. In severe weather, and especially at night, you might lessen the necessity for fire heat considerably by an external covering of mats, &c. Your other query was answered last week.

GRAPES NOT COLOURING (A. A., Ireland).—The most likely cause of the Grapes not colouring is too heavy cropping, with a deficiency of foliage. Black Hamburgs and all black Grapes are found to colour better with rather more foliage than the white kinds. Colour and bloom generally go together, when the crop is heavy the colour and bloom are seldom good; it is difficult to obtain large berries and bunches well coloured. The border in-side ought not to be allowed to become very dry so as to crack. Loosening the surface with a fork and making it fine will lessen the liability to crack. It is sufficient if, after the Grapes are ripe, the border be kept moist. When the Vines are at rest no water should be given; and if Grapes are hanging, and expected to hang in good condition some time, the border should be kept dry, but with sufficient moisture to keep them from shrivelling.

WATERING VINE BORDER (An Amateur).—As the present season has been exceptionally dry, you have done quite right in watering the border, the leaves being green. One watering, unless the soil was very dry, would have been sufficient after the fruit was ripe, as it is desirable to withhold water in order to secure the proper ripening of the wood, and the Vines bring in an inactive state very little is required to keep the soil moderately moist, which is all that is needed. Do not water again until you are about to start the Vines, say at the time of shutting-up, then give an efficient watering. Watering can do no good when the Vines are at rest. As a rule it ought to be discontinued after the fruit is ripe, but the soil ought to be moist until the leaves commence falling. We do not think the decay of the berries at the junction with the footstalk is due to any other cause than the watering, but it may be a consequence of too moist an atmosphere. It is usual for the roots to have the appearance you describe after the fruit has been ripe two months, but we think you have hastened the decay by the watering, which if not absolutely necessary to keep the soil moist, is positively injurious.

VINE LEAVES CHANGING COLOUR (A. A.).—The change of colour is quite natural; the wood of the Vines is ripening, and the leaves change colour before they fall.

PLANTING VINES IN GREENHOUSE FLOOR (Triepe).—If you have no border inside the house, it will depend in a great measure upon what the soil is, the means of affording water, and of carrying off the superfluous moisture, whether the Vines would succeed planted as you propose by removing a brick in the floor for planting. It is hardly to be expected that they can do much good; but the soil may be of such a kind as to be favourable to the Vines, and they may thrive. They ought to have some chance of progressing, which it seems to us they cannot have, planted in a hole in the floor of a house, the opening being only a foot square.

KNIGHT'S MONARCH PEAR DROPPING (C. Derry).—We cannot tell why your Knight's Monarch drops its fruit, considering that it is in a "free loam" and always mulched. Examine the fruit, and see if they have been attacked with a grub.

PEACH-HOUSE TRELLIS (John Elliot).—You ought also to fix a trellis to the rafters of the house, made of wire, and at a distance of about a foot from the glass. As shown on the plan sent, you do not sufficiently utilise the space.

PREVENTING POTATO DISEASE AND DESTROYING WIREWORM (Sahibi).—When the Potato crop is heavily manured it is more susceptible to disease. We think the manure you intend to use would answer; try it, and let us know the result. Cut Potatoes in half, and get some pieces of Carrot; insert the pointed end of a stick into each, and bury the pieces in the border, leaving the stick a little out of the ground to mark the place; examine them daily, and destroy the wireworms in them.

POTATOES (J. B.).—We cannot publish such strong testimonials of an unknown variety from an anonymous correspondent.

DESTROYING WEEDS IN PATH (L. Forbes).—There would be no danger in your using the following, which will keep the weeds under for a long time, destroying not only the plants but their seeds:—Dissolve 1 lb. of powdered arsenic in three gallons of cold water, boil and keep stirring, then add seven gallons of cold water and 2 lbs. crushed soda, stir the whole well whilst boiling, and with a rose watering pot apply hot to the walks in dry weather, from March to May inclusive being the best time. The above quantity will be enough for 25 square yards. An inclining board should be placed at the sides of the walks or grass to keep off the hot liquid. We do not know of anything but salt that would without some offensive ingredient rid you of the weeds. Salt will destroy them for a time. If you have Box edgings, the salt or the soda and arsenical solution above named must be kept from them, otherwise they will be killed.

FUMIGATING (J. G. H.).—Nothing answers better than a cylinder made of strong sheet iron from 6 to 12 inches in diameter. The bottom of this should be composed of small iron bars, placed close enough to allow the ashes to drop through, but not clinders. A handle may be attached to the top part similar to that on a saucepan, and a round hole in the side about an inch from the bottom should be made to admit the nozzle of a bellows. *Odontoglossums* and some *Oncidium*s, as well as some other tender *Orchids*, will stand moderate smoking. Vandas we have not yet seen injured by it. The best cultivators are shy of using tobacco in *Orchid* houses, as, if too much smoke is put in the house, a choice plant may be spoiled; they prefer rather to wash fly and thrips off with soapy water.

WATERPROOF PAPER COVERS (F. Thomas).—We should prefer calico. Cartridge paper is the best paper for the purpose. It should be damped before it is tacked upon the frame, because when dry it becomes taut. It may then be painted over with boiled linseed oil in which a little white lead has been incorporated. In nailing on the paper, a strip of tape should be placed between the heads of the tacks and the paper to check the tearing to which the paper is so subject.

HEATING PIT WITH FLUE (H. P.).—It will answer to take the flue along the front, having over it a foot of rubble, and then the soil for the plants at least a foot deep. One side of the flue might be exposed—in fact, form the side of the path, which we should have at back, with the flue entirely clear of the soil, so that you will have the flue along the front for bottom heat, and at back for top heat, and a pathway, which need not be above 2 feet wide; and the flue taking up 3 feet 6 inches, will leave you in 7 feet inside an equal space for the bed—viz., 3 feet 6 inches; 7-foot lights will not answer for so wide a pit, as you will need 9-inch walls up to the height of the flues at least, and then to the wall plates they may be 4½ inch; 9-foot lights will be required, and the front wall will need to be 1 foot 6 inches, and the back up to 7 feet. The pit may be sunk 2 or 3 feet, and the path also, so as to gain head-room, the Cucumbers being trained to a trellis in about a foot from the glass. It would be well if you could arrange to have ventilators in the front and back walls, as long lights are not readily moved.

NAMES OF FRUITS (J. R. P., Croydon).—No. 1, Black Hamburg; 2, Black Cluster. (L. J. B.).—Pears: 1, Aston Town; 2, Napoleon; 3, Ne Plus

Mouris; 4, Ne Plus Mouris. Apples: 1, York-shire Greening; 2, Red Calville; 3, Lake Sturmer Pippin. (J. Strachan).—1, Old's Apple; 2, Devonshire Quarrenden; 3, Robinson's Pippin; 4, Hawthorn-hen; 6, Kerry Pippin; 7, Wormsley Pippin; 12, Golden Noble. We cannot recognize the others. (W. R. Y.).—The numbers were put on so slightly there were only three attached when the fruit arrived. No 5, Belle de Noix; 6, Suffolk Thorn; 8, Beurre de Rances. The fruit with the brown side is Chautauque. (S. S., Thetford).—No. 1, Beurre de Rance; 2, Knight's Monarch. The seedling Apples are very handsome. No 1 is very much of the character of Gloria Mundi, and No. 2 is in the way of Franklin's Golden Pippin. We will keep them till they are ripe, and then report more fully upon them. (T. Cooper).—2, Lamb Abbey Pearmain; 3, Sturmer Pippin; 4, Surrey Flat Cap. The others appear to be older Apples, which we do not know. We have no recollection of having seen your former parcel. Did you pay the carriage? For if you did not, it, like many others, would be refused. (H. M., Surlingham).—1, Aston Town; 3, Vicar of Winkfield; 5, Eton; 6, Easter Beurre; 7, Knight's Monarch; 8, Brown Beurre. Apples: 1, Golden Reinette; 2, Bleu-henri Pippin; 3, Bradlock's Nonpareil; 5, Wormsley Pippin; 6, Hertfordshire Pearmain; 7, Kerry Pippin. (Shirley).—1, Hollandbury; 2, London Pippin; 3, Winter Peach; 4, Murgil; 5, Franklin's Golden Pippin; 7, Marmalade Pippin; 8, scarlet Nonpareil. (S. M. W.).—Apples: 1, Anjou Reinet; 2, Bleu-henri Pippin; 4, Hollandbury; 6, Beauty of Kent; 8, Dutch Monarch; 10, Golden Winter Pearmain; 12, Bunselow's seedling; 13, Nonpareil; 14, Pittsford Russet; 17, Pittsford Russet; 19, Golden Reinette; 20, Early Morning; 24, Hawthorn-hen. Pears: 1, Glou. Moineau; 2, Marie Louise; 3, Urbaniste; 4, Van Mons Lion Leclerc; 5, Passe Colmar; 6, Brown Beurre. It is a pleasure to name such specimens as these. (Francis and Arthur Dickson & Co.).—2, Vicar of Winkfield; 3, Marie Louise; 4, Botten; 8, Vicar of Winkfield; 9, Beurre d'Arenberg; 10, Flemish Beurre; 11, Vicar of Winkfield; 12, Marie Louise; 13, Botten; 14, Orange Bergamot; 17, Black Worcester; 19, Figue de Naples; 20, Botten; 23, Beurre Blanc des Capucins; 24, Red Doyenne; 24, Beurre d'Al. Apples: 1, Mère de Ménage; 2, Early Morning. (T. G., Orkwood).—It is Catawba, an American Grape. (Robert).—The fruit was quite smashed, and the juice had obliterated the numbers on the papers. We can only say that the white one is White Tokay. (G.).—The Pear is Noreau Potée, and the Apple Keswick Codlin. (W. S. G.).—1, Brown Beurre; 2, Glou. Moineau; 3, Pile's Russet; 4, Scarlet Nonpareil; 5, White Magenta Bonum. (A. J.).—1, Louise Bonne of Jersey; 2, Fondante d'Automne; 3, Van Mons Lion Leclerc; 4, Bergamotte Esperen; 5, Suffolk Thorn; 6, Vicar of Winkfield; 8, Sturmer Pippin; 9, Court-pendul-Pippin; 10, Robinson's Pippin; 11, Sturmer Pippin; 14, Flemish Bon Chretien.

NAMES OF PLANTS (Co. Antin).—We cannot undertake to name *Borists* varieties of *Fuchsias*. (G. S.).—Your *Agave* is *A. crinitus*.—M. J. B. (*Laquiere*).—*Cyathus vernicosus*.—M. J. B. (*Lady King*).—*Abies Menziesii*; *Cryptomeria elegans*.

POULTRY, BEE, AND PIGEON CHRONICLE.

THE POULTRY-KEEPER.—No. 23.

PARTRIDGE COCHIN.—COCK.

The principal characters of the plumage of the cock are like those of the hen; but the markings are on a ground of dark tan, which render here and there the characteristic marks doubtful, which are more apparent in the breast, the hind parts, the thighs, and the feathers of the feet. The shoulders, the back, the coverts of the wings, are of a dark red mahogany. The hackle and the lance-shaped feathers are bright red and dark gold. The tail is iridescent black. In England birds with the darkest possible breasts, and approaching to black, are preferred to those with brown breasts. The three varieties, Cinnamon, Buff, and Partridge, are natural productions, and do not seem to come from any cross.

WHITE COCHIN VARIETY.

It is supposed that the White, which should be without any dark mark, has been obtained by repeated crossing of the Buff Cochin cock and the White Malay hen. They often come out with red or coffee-colour tinges; these should not be bred from. A run of White Cochins of fine quality is most bright and attractive.

BLACK COCHIN VARIETY.

The Black variety seems to have been obtained by the union of a dark Cinnamon Cochin cock with the Breda hen, which is of a beautiful black, and is not unlike the Cochin-China hen. This variety is highly esteemed as much for its beauty as its productiveness; but it has two defects: The greater part of the cocks are generally marked on the hackle with red, and sometimes on the shoulders and lance-shaped feathers; also, the cocks are, and that without exception, more or less marked with white at the root of the tail sickle feathers. These marks are not easily hidden, for they generally reach to the middle of the feather. The white marks appear equally on the feathers of the feet in the cock and hen, and this especially after the moulting of the second or third year.

But these drawbacks render the specimens without such marks more valuable, and they are more sought after. Certain amateurs admit, provided the birds are well shaped, the Black Cochin with red hackle, and these are their reasons:—

First, the white generally appears less with birds the issue of the cock with red hackle.

Second, it is almost always amongst the cocks with the red hackles that the best-shaped and largest specimens are found.

Third, these red cocks reproduce black cocks as often as do the black ones.

Fourth, they produce stronger hens, better shaped, and of a purer black.

A more important question seems to be the colour of the feet. Some people say they should be yellow, others that they should be black. Here there is no hesitation necessary. The black feet is in conformity to the colour of the rest of the bird, and further, is excellent to eat. The chickens when hatched are speckled black and white, but the white gradually disappears.

TUNBRIDGE WELLS POULTRY SHOW.

This Association holds its annual meeting always in October in conjunction with the Agricultural Show, and the poultry department, to which we principally directed our attention, was this year better than ever. We once heard a story of a gentleman who had just started farming, and who was quite a novice at the pursuit. He asked a friend when was the proper time to plough his fields; he was told, when there were no ploughs to be lent, and all the farmers were using them themselves! Not so, however, with a poultry show. The time most certainly to hold one is when no other town is holding its exhibition, if that happy time can be found. Tunbridge Wells hit on it, however, this year, which accounts no doubt for the quality and quantity of the entries. Mr. Hedley always judges at Tunbridge Wells. He is as well known as the Secretary himself. This year, however, the entries were so numerous that another Judge had to be engaged as well, and the selection fell on Mr. W. J. Nicholls, so well known for his kind courtesy at the Palace Shows. We were glad to meet him here, and hope we may soon find him again in the same office. The awards in nearly every case were most satisfactory. Mr. Hedley judged the Game, Dorkings, and Hamburgs alone, Mr. Nicholls the Cochins, Brahmas, and French. The other classes the two Judges did together.

Dorkings came first on the list. There were a great many crooked-breasts. The first were nice smart birds, in good feather, but not very large. Second were good Whites, but with rather stained ears. Third very fair. Mr. Cheesman's highly commended pen would have been first, only there was a spur growing outside. Pen 3 (Mrs. Stratford) were huge Whites, but the cock very crooked-breasted; still we almost think their great whiteness and size should have overbalanced this defect. **Cochins**, Buff, were very few. The first-prize pen had a fair cockerel and a very good pullet; her comb was not good, or else we should have thought her as good as any we have seen this season. The second had a fine Cinnamon cock, but a poor hen. In the Variety Cochins class all the prizes went to Whites. The first and second were won by Mr. Woodgate with two pairs of chickens, good in all points, and well shown. The first-prize cockerel was a very grand bird. Third had a weedy cockerel, with a hooked but good pullet.

Brahmas were splendid classes, both the Darks and Lights. The first-prize Dark pullet was a picture; we almost think her pencilling the best we ever saw; had she a little more leg-feathering she would be the best we have seen for a long time. The cockerel with her was too young. The other prize pens were good also. The first and second Light Brahmas were two good showy pens. We should have penned them differently, placing the second pullet with the first-prize cockerel, and *vice versa*; they would have matched better thus. Though the second pullet was bad in comb, the first was really good, but she lacked leg-feather. The third were good-shaped but very young birds. Pen 47 (Lemo) had a splendidly-shaped cockerel. Highly commended, Pen 61 (Haywood), good.

Spanish were poor. We missed the quality of former shows of this Society. The best pen of Spanish in the Show was a pen of chickens, which from some mistake were entered in the Brahma class, and consequently thrown out.

The **French** mustered well. In **Houdans** all the prizes went to Faversham, and three grand pens they were. We seldom saw a better pullet than the first-prize; she had just that mixture of colour we admire, but all the cocks' combs were too like the Crèves. The second cockerel we should have penned with the first pullet. Highly commended 69 (Hibbert), a good cockerel. The first Crèves were very fine, the only perfect-coloured birds in the class; they walked in. Second nice old birds. Third well-grown chickens.

The **Hamburgs** were wonderful. We certainly never saw such good ones at this Show before. First, second, and third were all Gold-pencils and good specimens. Pen 93, very highly commended (Cresswell), had a most exquisite cockerel, but the pullet was too pale on the breast, or they would have been near winning. In the Spangles, the first Silvers were quite lovely; the spangling and colour perfectly wonderful, and with such style. The second were good but young Golden-spangles. We were sorry to see no Blacks in the Variety Hamburg class.

The **Game** were very good. Mr. Fitz-Herbert came off well. We do not think we liked the first-prize Black Red cockerel so well as the same exhibitor's second or even highly-commended bird. The third Reds were a smart pen. In the next Game class Piles won all the prizes. The first pullet was a great beauty, of admirable shape, and good in head. Third also good. A capital pen of Duckwings (Sandford) were highly commended.

In the Variety class **Silbies** were first and second, and we never saw two better pens; they were simply perfect; we thought there was hardly anything to choose between them. The first pullet was a little yellow, the first cockerel had the best comb, and the first pullet was rather poorly leg-feathered. Third went to good Silver Poles; the hen one of the best out, but the cockerel not through his moult. The **Selling** classes were large, but not up to much; in fact, we never saw fewer bargains. Bantams were all muddled together. This gives neither Judge or exhibitor a fair chance. First and third went to Sebrights; we almost preferred the third to the first. The second prize went to good White-booted. Pen 195, very highly commended (Long), good; pen 199 (Lee), good Silver Sebrights, but the tail was too cloudy.

The **Ducks** were wonderful. The first Aylesburys were a grand pen; in fact, they were quite out of the common way. Second also a good pen. Rouens good, first especially so. The Variety classes were beautiful, and called forth much admiration. **Geese** and **Turkeys** were really good classes. The prize Turkeys were in very fine feather.

PIGEONS were all in two classes, the first for two pairs, the second for single birds. In the latter class a splendid young Carrier won; it was good in each point, his only blemish was a little white between the legs. Second a good **Dan Carrier** Cock. Third a nice **Antwerp**. These classes made a pretty finish to this charming little Show.

DORKINGS.—1, H. Humphrey, Ashington, Pellsborough. 2, Lady A. Nevill, Frigate Castle. 3, H. Mills, Dorking. *hc*, Mrs. W. Stratford, West Malburg; R. Cheesman, Westwell, Asford (2); W. Goodwin, Withyham.

COCHINS.—*Cinnamon or Buff*.—1, Mrs. A. Christy, Edenbridge. 2, G. E. Smart, Tunbridge Wells. *Any other variety*.—1 and 2, R. S. S. Woodgate, Pembury, Tunbridge Wells. 3, G. F. Talbot, Edenbridge. *hc*, Mrs. Christy; Mrs. Wilde, Cuckfield.

BRAHMAS.—*Dark*.—1, M. Lemo, Markyate Street. 2 and 3, W. Jacob, Shepherds-well, Dover. *hc*, J. Long, Bromley Common. *hc*, R. Sheppard, Tonbridge. *Light*.—1 and 2, S. B. 14, Old Hastings. 3, T. Brown, Hartham. *hc*, M. Broad. 4, J. Long. *hc*, F. Haines, Edenbridge; A. Smith, Goudhurst; S. P. Broad, Reigate; E. Haywood, Uckfield. *c*, H. Stead, Tunbridge Wells.

SPANISH.—1, Mrs. Brassey, Normanhurst Court, Ratton. 2, J. Francis, Hildenborough, Tonbridge. 3, H. Stephens, Tunbridge Wells.

HOUDANS.—1, 2, and 3, W. Dring, Faversham. *hc*, G. W. Hibbert, Godeley, Hylte; E. Haywood.

CRÈVES.—1, W. Dring. 2, Mrs. A. Christy. 3, G. W. Hibbert. *hc*, Miss A. Sharpe, Tunbridge Wells.

HAMBURGS.—*Pencilled*.—1, J. Long. 2, A. F. Faulkner, Thrapstone. 3, G. J. Lenny, Lewes. *hc*, O. E. Cresswell, Early Wood, Bagshot. *hc*, J. Long. *Any other variety*.—1 and 2, J. Long. 3, C. E. L. Lucas, Maidstone.

GAME.—*Black or Brown Red*.—1, 2, and 3, G. H. Fitz-derbert, Sevenoaks. 4, A. Ward, West Farleigh. *c*, S. Tompsett, Groombridge. *Any other variety*.—1 and 2, G. H. Fitz-derbert. 3, H. Ritchie, Eridge. *hc*, M. Sandford, Martin, Dover.

ANY OTHER DISTINCT VARIETY.—1, S. P. Broad. 2, R. S. S. Woodgate. 3, J. Long. *hc*, S. P. Broad; R. S. S. Woodgate.

SELLING CLASS.—*Cock*.—1, T. Brown. 2, R. S. S. Woodgate. 3, H. Stephens. *hc*, M. Lemo. *hc*, R. S. S. Woodgate; H. White, Wateringbury. *c*, N. Edghill, Frant, Tunbridge Wells. *Hens*.—1, H. Mills. 2, Mrs. Wilde. 3, Dr. Angier, Tunbridge. *hc*, T. Brown. *c*, W. Goodwin; H. Stead.

SELLING CLASS.—1, H. Humphrey. 2, W. Dring. 3, Rev. N. J. Ridley, Holington House, Newbury. *hc*, Rev. A. W. Ward, Little Horsted Rectory, Uckfield; C. Oswin, Hawkhurst; R. S. S. Woodgate. *c*, H. Stead.

BANTAMS.—1 and 2, M. Lemo. 2, R. S. S. Woodgate. *hc*, Master M. V. Sandford, Dover. *hc*, C. Woodman, Southborough; Mrs. Lee, Censhurst, Tonbridge.

DUCKS.—*Aylesbury*.—1, F. E. Arter, Barham, Canterbury. 2 and 3, N. Edghill. 3, G. Ware, Frant. *hc*, W. Jacob. *c*, Mrs. A. Christy. *hoyou*.—1, A. Ward. 2, H. Stead. 3, G. Ware. *hc*, G. F. Field, Ashurst; E. Haywood; M. Brassey. *c*, Earl of Aberghenny, Eridge Castle. *Any other variety*.—1 and 2, M. Lemo. 3, S. P. Broad. *hc*, E. Haywood; R. S. S. Woodgate.

GEES.—1 and 2, G. F. Field. 3, Mrs. Lee. *hc*, A. J. B. B. Hope.

TURKEYS.—1 and 3, A. Ward. 2, Marchioness Camden. *hc*, Mrs. Brassey; R. S. S. Woodgate. *c*, Earl of Aberghenny.

PIGEONS.—*Any variety*.—*Pairs*.—1, Mrs. Lee. 2, N. Duckworth, Tunbridge Wells. 3, G. H. Fitz-derbert. *Any variety*.—*Single bird*.—1, Col. F. Hassard, Sevenoaks. 2, M. Lemo. 3, C. Elliot, Southampton. *hc*, M. Lemo; W. Hoag, Oakley, Tunbridge Wells; Col. F. Hassard; A. Bentley, Clements Lane, Lombard Street (2); G. J. Lenny; C. Elliot.

RABBITS.—*Any variety*.—1, W. Layton, Edenbridge. 2, J. Ellis, Reigate. 3, Mrs. W. Stratford. *hc*, B. S. Whitton, Highbams, Goudhurst; — Mathewick, Frant (2). *c*, H. Stephens.

JUDGES.—Mr. H. Hedley, Claremont, Redhill, Surrey; and Mr. W. J. Nicholls, Saffron Hill, Farringdon, London.

NOTTINGHAM POULTRY SHOW.

ALTHOUGH some of the arrangements connected with this Show were decidedly behindhand, much excuse may be fairly urged in favour of the managing Committee, who were all of them quite new to their work, it being their first attempt to establish a show in the town. The entries, too, were far beyond the expectations of most, if not all, the gentlemen composing the Committee; and we were told that little more than a month back the holding of a show was not even contemplated. We may safely add that a more uniformly obliging Committee to every applicant for information is of rare occurrence. Again, although the time the Show continued open was very far too long for chickens unaccustomed to a show pen, the condition in which the fowls reached their owners bespoke a constant and well-directed attention to them during the whole time they had been exhibited. Messrs. Turner's pens erected in a most suitable building constructed entirely of wood, but with a tightly strained canvas roof, proved admirably efficient for general purposes; but three tiers of pens should always be avoided if possible.

In *Game* fowls many of the best specimens, particularly adults, were mostly quite out of feather; but most of this year's chickens, which proved to be the majority, made the *Game* classes unusually good. It is years since so many really good-coloured Duckwings were shown so early in the season. All the *Cochins* were well represented; the *Buffs* of 1871 promising to shortly quite excel the older and well-known winners of the past summer. Partridge-feathered, though exceedingly good, could not be seen to advantage from being in the lowest pens of all, where, unhappily, a close approach to general darkness prevailed. *Brahmas* of both colours formed a very fine collection, the *Dark* ones being decidedly the better of the two; the pencilling on a majority of the pullets was never excelled. Mr. Beldon with his so generally and so well-known stud of *Hamburgs* was enabled to hold his own pretty uniformly, but only under a very severe competition in all the varieties. The collection of *Bantams* was, as of late the rule, of great merit; the Silver-faced *S-brights* mastering very strongly and well. The *Aylesbury Ducks* would not have disgraced any meeting, even *Aylesbury* itself; and in a good entry *Whistling Ducks* and the *Carolinians*, or *Summer Ducks* of America, were shown in gorgeous feather. Had not so much care been evinced by the acting Committee, the weather would have been adverse to success; but as it was, visitors were abundant, everyone was well pleased, the rain did no injury, and the pecuniary success was as far beyond expectation as it was well deserved.

The names of the Judges and list of awards were given in our last issue.

(From a Correspondent.)

THE first Nottingham Poultry and Pigeon Show was held from the 2nd to the 6th, in a commodious wood building erected for the purpose in the Market Place, and as a first show we think the Committee and the Secretary may be congratulated on their attempt, as the entries were large, there being 513 entries in poultry and 233 in Pigeons, and we were informed that the Committee had to refuse upwards of a hundred entries from want of room. We should have been glad if more room could have been had, as the space for the number of entries was insufficient, and as a necessity many of the pens were upon the floor, which, in addition to those pens being dark, did not give the Judges an opportunity of so thoroughly inspecting them as is necessary. We would also say that the Judges had not sufficient time, as the Show was advertised to open at twelve o'clock, and by some means the Judges could not commence until nearly 10.30, although they were ready at eight, as requested by the Secretary. We think this a great mistake, but no doubt these matters will all be remedied another year, as both the Secretary and Committee seem able and willing to do anything they see for the improvement of the Show. Mr. Hewitt judged the *Game*, *Dorkings*, *Cochins*, *Brahmas*, *Aylesbury Ducks* and variety *Ducks*; and Mr. Dixon the *Hamburgs*, *Spanish*, *French Fowls*, *Bantams*, *Selling classes*, *Rouen Ducks*, *Turkeys*, and *Geese*. The *Pigeons* were judged by Mr. Esquilant and Mr. Allsop.

The *Game* classes were all well filled, and in addition to the prize birds many were very deservedly highly commended. The first class, *Black or Brown Reds*, had fourteen entries, and in addition to the four prizes four were highly commended. First, second, and fourth were *Brown Reds*, third *Black Reds*; all good. In hens the first and second were *Black Reds*, the third and fourth *Brown Reds*; three were very highly commended, and three highly commended. This was a very good class. In Any other variety the four prize birds were all good, and the same may be said of the *Hens*; the first and second were *Duckwings*, third *Pile*, and fourth *Duckwing*.

In *Dorking* cocks Mrs. Arkwright was first and second with two capital birds; the third and fourth were also good. We very much admired the first-prize pullet shown by Lady A. B. Peirse; we thought her the best out this season—a capital colour, large frame, good in leg, in fact not a point wanting. The other three prize birds were all good. In *Dorkings*, Any other variety, the entries were not large; but the prize birds were of fair average quality.

The *Cochin* cock class had only eight entries. First was a good large old bird; the other three prizes went to good cockerels. The hen or pullet class had sixteen entries, and a better lot it has not often been our privilege to see. The four prize birds were all of great merit; five were very highly commended, and six highly commended, so we can see Mr. Hewitt's opinion of them. The *Partridge* class was well represented—ten cocks, and seventeen pullets or hens; all the prize and commended birds were of great merit. The four prize birds were all cockerels; but in hens or pullets the awards were reversed, all went to hens. This was a very good class; three were very highly commended, and three highly commended.

We now come to the *Brahmas*. *Dark* cocks or cockerels had sixteen entries; the prize birds were all of great merit, and we thought them well judged. In hens or pullets there were twenty-eight entered; the first was a grand hen; the second a pullet of

unusual quality, colour, and shape—all that could be desired; the other prize pullets both good. The same may be said of the four very highly commended pens, and in addition four were highly commended, and three commended. This was really a good class. In *Light Brahma* cocks there were twenty entries. The prize birds were good; but we did not like this class so well as the pullet class, which had twenty-five entries. The first and second were good hens; third a capital pullet; four in this class were rightly very highly commended, and four highly commended.

In the *Hamburg* classes *Gold* and *Silver* competed together, a plan we do not like. In cocks or cockerels first was a nice *Silver*, second and third good *Gold*; we also liked the very highly commended one. In hens or pullets there were fourteen entries. First and third *Golden*, second a good *Silver*. All were birds of this year. One pen was very highly commended, and three highly commended. In *Spangled Hamburgs*, the first cockerel was a splendid *Silver*, second a capital *Gold*, third a good *Silver*; the three highly commended pens were also good. In hens or pullets we thought the first-prize pullet about the most perfect one we ever saw, and it is likely she will be heard of again; the second and third were both good, and four pens were highly commended.

In *Spanish* the first was a very good deep faced cockerel with capital comb; second an adult, very good in face and comb; third a very good cockerel. In hens or pullets the first and second were very good large-faced hens; the second we thought in the catalogue priced below her value—35s., but as they were to be sold by auction, probably she would realise more. Two were very highly commended, and two highly commended.

The *Houdan* classes were very large—nineteen cocks and thirty-one hens or pullets. In cocks we were much pleased with Mr. Wood's two pens; they were large-framed birds, and good in all points. The third and fourth were both very good; one was very highly commended, and four highly commended. In hens or pullets the four prize birds were all adults, and large well-marked birds; one was very highly commended, and eight highly commended. This was a really good class. The Any other variety *French* fowl had some very good *Croves*, but the classes were not large, only five and six being entered in the two classes.

In Any other variety cocks was a good *Poland*, second a very good *Black Hamburg*, third a good *Malay*; in hens first a splendid *Black Hamburg* pullet, second *Golden Poland*, third *Malay*.

The *Game Bantam* class, *Black or Brown Red*, had twenty-two entries; the first and second very good *Black Reds*; third were *Brown Reds*; three pens were highly commended. *Game Bantams*. Any other variety, first were a pen of very stylish *Piles*, good in all points, second *Duckwings*, and third *Piles*; three pens were highly commended. In *Bantams*, Any other variety, good *Gold-laced* were first, *Blacks* second, and *Silver-laced* third. Two very good pens of *Gold* and *Silver-laced* of Mr. Leno's were very highly commended.

In the *Selling* class Mr. Leno was first with a good *Light Brahma* cockerel; *White Cochins* were second, and *Spanish* third. In pair of hens there were nineteen entries; first were a nice pair of *Light Brahmas*, second *White Cochins*, and third *Dark Brahmas*; five more pens were highly commended.

The *Duck* classes were all good, and the entries pretty numerous. *Geese* and *Turkeys* were of fair average quality.

PIGEONS.—The *Carriers* were the first on the list; first was a grand *Duo*; second a *Black*, nearly equal; third a good *Dan*. The highly commended pens were all good birds. Mr. Yardley was first in hens with a first-class hen; and Mr. Horner was close upon him with second. In *Carriers* hatched in 1874 one exhibitor won all the three prizes with very promising birds. *Pouters* were not large classes; but the winners deserved their position. In *Barbs* the winners were very good; first were *Yellow*, second and third *Black*. The *Tumblers* were good classes, eight entries in cocks, and nine in hens; the prize birds all very good. In the *Dragon* class there were seventeen entries, Mr. Graham and Mr. Gamon taking the prizes with very superior birds. The *Fantails* were good, and the prizes well placed. The *Owls* and *Trumpeters* were both good classes, and we thought well judged. *Jacobins* were very good, and four pens highly commended. The remainder of the classes were all of considerable merit, and many high commendations were awarded.

DARLINGTON ORNITHOLOGICAL SOCIETY.—This great event in cage-bird circles is to come off in the Mechanics' Hall, Darlington, on Friday and Saturday, November 13th and 14th, under distinguished patronage. The Show is open to all England, and the schedule contains thirty-two classes of nearly all the known varieties of *Canoaries*, *Mules*, and *British* and *foreign* birds. The prizes in twenty-eight classes are £1, 10s., and 5s.; and in four other classes, *British* birds, 15s., 10s., and 5s. This may be considered one of the best schedules yet issued, and the growing efforts of the spirited Committee are worthy of all support. Besides the above money prizes there are ten special prizes,

M. Garside, Broughton, Manchester (Carriers); P. Higgins, Northampton (Blue Dragons); J. Osborn, Northampton (White Dragons).

RABBITS.

LOP-EARED.—Back or Doe.—Crust Stand, J. Boyle, Blackburn. 2, Mrs. H. Pickworth, Mount Mars, Spalding. 3, F. Lovelock, North Street, London. Extra 3, R. H. Baldwin, Kingsthorpe, Northampton. *See* J. Levings, Blackburn; J. Crauch, St. John's Wood, London; J. Mason, Hull; F. Schiedel, jun., Cheetham, Manchester. *See* R. Robinson, Millersburg; J. Hunt, York; F. Lovelock; F. R. Edmondson, Liverpool; W. Canner, Leicester; F. Schofield, jun., & G. Balles, Newbury; Brown, Gayton.

DUTCH.—Back or Doe—1 and 2. F. Sabbage, Northampton. 3, J. Mason, Hull; J. Boyle; C. Martin; T. Gruner, Kilsthorpe, Northampton. c. Rev. T. C. Beasley, Dallington, Vicarage, Northampton; Tebbutt & Foster; J. C. Irving.

ANGORA.—Back or Doe—1. W. Bowes, Elmhurst, Darlington. 2 and 3, T. Garner. *See* J. Martin. *See* T. Garner; J. Martin. c. S. Siskins, Wolverhampton.

ANY OTHER VARIETY.—Back or Doe—1. S. Ball, Bradford (Silver-Grey). 2, R. H. Baldwin (Himalayan). Extra 2 and 3, Tebbutt & Foster (Himalayan and Belgian Har.). Extra 3, G. Wood, Clapton, Thrapstone. *See* Tebbutt & Foster (Himalayan). *See* A. W. Whitchose, Northampton (Silers); F. Schofield, jun. (Silver-Grey); J. Boyle (Silver-Grey); E. Komus, n. Kettering (Silver-Grey); H. Hucks, Humberstone, Leicester (Silver-Grey); J. Steoder, Fingewick (Silver-Grey). c. J. Felling, Leeds (Himalayan).

SILVER CLASS.—Back or Doe—1. Tebbutt & Foster (Himalayan). 2 and 3, F. Sabbage. *See* J. Steoder; E. Robinson; T. Garner; F. Lovelock. c. W. H. Crews; Mrs. Francis, Northampton.

SPECIAL PRIZES.

Cup for Canaries won by J. Adams, with twenty-seven points.

Cup for Pigeons won by H. Yardley, for best pen.

Crust Stand for Rabbits won by J. Boyle, for best pen.

JUDGES.—Cage Birds: Mr. W. Walter, Winchester; Mr. J. Buxton, Derby. **Pigeons and Rabbits:** Mr. E. Hutton, Paisley.

NOTTINGHAM AND ITS CANARY SHOW.

It is not my intention to enter into all I was eye-witness to in the good old town of Nottingham, famous for many things—notably its lace and the ruins of a once-famous castle. The "Goose fair" is of a world-wide renown, claiming as it does the good old age of 500 years, the fair having been established in the year 1241. My visit was not confined to the attractions in the vast market place, covering as it does an area of five acres, not one foot of which space was unoccupied. "Music hath its charms," but I was far from being charmed with the continuous deafening din of the busy vendors of ginger-bread and oysters, mingled with the wry-mouth cry here and there of "ten-a-penny-wanants;" the barking and howling of the dogs (it was the dog show); the blaring sounds of the musicians, not omitting the goings in front of the several wild beast, and acting, and a waxwork establishments, with the now-and-then energetic appeals from inviting stagers to "wauk-up," accompanied with the far from pleasant feat of elbowing one's self through the many thousands of human and inhuman beings. This to me was the reverse of harmony. However, I got through my difficulty and sought a shoe-black, after satisfying myself that my watch was all right. Nottingham would be at a discount without a display of Michaelmas Geese (some of which, by-the-by, are ganders); and having taken a glance of the same, mostly clothed with feathers of Embden whiteness, besides numerous other "geese" with no feathers at all, but withal that might be white enough the following day, I wended my way towards the Bird Show.

The town appears to be plentifully provided with dogs (a lucrative matter no doubt so far as the dog-tax is concerned), mostly of the breed called fox-terriers, but which appeared to me to be of the bull, snap, and terrier crosses; but on this point it would be better to "sing slow," rather than venture a remark to the effect that they were ought else than the pure type of fox-terriers, if by chance you might get into the company of some of their owners. Still I have reason for knowing there are to be found in the locality some of the right sort. Perhaps the best were at the Show. The dogs at large might, as it were, have understood that the occasion was a special one, for in the particular part of the town (Hockley), I had to pass through, there was to all appearance a conference of the canine community ready to exercise their pugnacious propensities. There were six in one group, and just as I was passing two of the most ferocious brutes threw me into a sudden paroxysm of terror by having a "go in" (as a Nottingham costermonger would say), in close proximity to my heels. Such notable personages as costermongers seem to be the reverse of scarce at Nottingham. Rumour spoke of a "set-to" in the P. R. somewhere on the outskirts of the town, and I did hear the name of one of the combatants, which commenced with the second vowel. I must not omit mentioning that a poultry and Pigeon Show was also being held, but my mind was bent more particularly upon the cage birds, to which I shall now confine myself.

The three-days Bird Show, held in the St. John's School-room, near the Great Northern Railway station, opened at midday on the 5th inst., soon after the Judges had completed their duties. To the "fancy" in particular it was a "feast of feathers," many of whom assembled from various parts of England to witness that which was looked upon as the first important show of the season for Norwich-bred birds. I really believe the sensation respecting the high-coloured birds has not abated one jot since last year, and "great expectations" were looked forward to by all who have been persistently endeavour-

ing to outvie each other for colour. Rumour had got abroad that there was something hot in the Canary world, and there was no wonder at it considering the quantity of cayenne pepper that must have been used to bring the birds to such high colour. It was whispered that Mr. ——— would bring forth "a fleet" to defeat all comers. Nothing daunted, one ambitious exhibitor had gathered together thirty showy specimens to win the principal "special;" but his endeavours were of no avail, for Mr. Evans's aggregate number of twelve points was placed *hors de combat* by Mr. Adams's thirty-two points gained with sixteen birds, thus entitling the latter exhibitor to the beautiful "service," and Mr. Evans's pluck being rewarded with a full-sized "cup," large enough to invite those who had assisted him in winning the second "special." The Nottingham fanciers had faith until the day that none could compare with their own specimens, and they too were warm, but when the "curtain was drawn" that faith vanished.

"But things like that you know must be
After a famous victory."

The number of birds entered for the Show did not come up to my expectation, but the quality was "all there." The cause of this in a great measure was, no doubt, owing to the Northampton Exhibition opening the day the Nottingham Show closed. This is to be regretted, for several exhibitors had to divide their entries and give each a turn. It is an unwise plan to let shows clash where it can possibly be avoided.

In the first class, *Clear Yellow Norwich*, Mr. Adams of Coventry ran an easy race, walking in with first and second, "hands down;" still Mr. Audley's third, to use a modest term, was a nice bird. The first-prize Yellow was not a large bird, but well up in colour. It was claimed at the catalogue price of 30s. by a gentleman who, I afterwards learned, transferred his purchase. The bird was cheap at the sum, but the greatest surprise to many present was the fact that the bird had become the property of a Derby fancier. Whether Derby fanciers are in the background or not this season time will tell. What a change in a year! "Oa! Cherrybum, Cherrybum! Where art thou, Cherrybum?" Can no one rush in to the rescue? In *Clear Buffs* Mr. Adams was again first and second with a couple of splendid birds. Mr. Tomes, one of the oldest of the Northampton school, came in for third with a richly-plumed bird.

The first prize in *Variegated Yellows* was awarded to a "loud"-looking bird belonging to Mr. Adams, the second and third prizes completely paling beneath it, albeit they were comely specimens. The second was given to Mr. Audley of Leicester, the third to Mr. Watson, Derby. Mr. Adams next won first honours in *Variegated Buffs*, Mr. Evans being second and third. There were several birds of high commendation in each class.

In *Ticked Yellows* the first was withheld, the second prize being awarded to a very deserving fair-coloured and condition bird belonging to Mr. Graves of Nottingham. Mr. Tomes's bird won a third. In this class the specimens were few and far between, and the quality generally not up to previous classes. In *Ticked Buffs* Mr. Adams was to the fore, the second and third prizes being deservedly accredited to birds belonging to Mr. T. Smith. Throughout nearly the entire class the specimens were of exceedingly good quality and condition, excepting one from Norwich, which would have been better at home to finish its moult.

The *Yellow Crested* beyond the first three birds were moderate. Messrs. Clarke & Newton, Nottingham, gained first and third positions; Mr. Roberts being second. The *Buff Crested* throughout the class were excellent, and must have exercised the patience of the Judges in discriminating. However, Mr. G. Dolman, Nottingham, came in for the first place with a bird possessing a crest, every feather of which was in its place. The second prize was awarded to a bird belonging to Mr. Torr, Derby, which will somewhat improve when the crest is fully blown. Mr. Goode, Leicester, exhibited a good bird, and it is not the first time he has done so.

Belgians were a mixed lot, some in position and others much out, and looking more like "Dutchmen." Mr. H. W. Man, Middlesborough, had no difficulty whatever in winning the first prize with his famous Yellow bird, and leaving in the distance all others. The second and third birds must have taken more judging; still, Mr. Whitaker with his promising third-prize Buff had to succumb to Mr. Wilcockson's second (a Yellow), a very good bird of the right stamp. It does one good to find occasionally a new aspirant for "Belgian" fame, but such was the case here, one Mr. Davis of Wolverhampton putting in an appearance with a specimen which gained for him a "v.h.c." It is high time that Wolverhampton issued its schedule for a bird show.

Lizards.—Messrs. Cleminson & Ellerton of Darlington took first prize with a fine-made Jonque, thus maintaining the prestige hitherto gained by Lizard fanciers in that neighbourhood. Mr. S. Godber, Nottingham (an old Lizard fancier), won the second prize, and Mr. Richards, of Bulwell, third—both capital birds. The first prize in Silvers was an easy win, Mr. Roberts, Derby, exhibiting a truly neat and splendid hen. Mr. Richards was

second, and Mr. Godber third. In both the *Cinnamon* classes Mr. Adams completely eclipsed all comers, by winning the half-dozen prizes in *Jonques* and *Bufs* with his hitherto matchless specimens. *Any Variety*.—Mr. Evans took first and second honours with a couple of *Manchester Coppers* of fine breed. These were the best specimens Mr. Evans exhibited, and would not disgrace the cotton city.

The *Mules* were a mixed company, but still there was here and there a telling specimen or two. Mr. Spence, of South Shields, ought to feel proud (no doubt he does), in possessing such a splendid, symmetrical, fine-conditioned, and nicely-marked *Canary* and *Linnet Mule* as that he exhibited. It deserved the first prize that it gained. The second-prize bird was likewise a choice specimen of similar breed to the one defeating it. Mr. Tenniswood was the owner. Mr. Goode exhibited a *Goldfinch* and *Canary Mule*, which was awarded the third prize.

The *British Birds* were not up to the mark, the first prize being withheld, and the second awarded to Mr. Worth's *Owl*; third, Mr. Evans, with a middling *Goldfinch*. In this class a *Robin* appeared lost and in sad spirits, and it would have been a mercy to have set the poor thing at liberty.

The *Selling Class* had a few worthy birds in it. Mr. Evans was first, Mr. Whitaker second, and Messrs. Clarke & Newton third.

Upon the whole there is all praise due to Messrs. Holmes and Allen, and the spirited promoters (the Committee), for their endeavours. But before concluding my report I must mention one more feature, that of a fancier who appeared to satisfy himself in pacing to and fro the show-room, now and then "holding forth" with others, and declaring there must be a "revision of the Judges." Whether he wished to occupy so distinguished a position himself I could not ascertain, or whether he was an exhibitor direct or indirect I am likewise at a loss to know. One word of advice: It would be as well, perhaps better, if the "regulations" in most of the schedules as to specimens being the "bona fide property of exhibitors," were regarded in a more scrupulous degree.—AN EYE-WITNESS.

YORK ORNITHOLOGICAL SOCIETY.—An Exhibition of *Canaries*, *Mules*, and other birds, open to all England, will be held in the Corn Exchange, York, on November 10th and 11th, the same week as *Darlington*, and those who exhibit at York will be able to arrange for their specimens being forwarded on to *Darlington*. The schedule contains twenty-four classes for cage birds. The prizes are 10s. and 5s. Mr. G. J. Barnesby, Derby, will judge.

MANIPULATIONS AT THE CRYSTAL PALACE BEE SHOW.

A YOUNG apiarian asks if "BEATEN BUT NOT DISMAYED," is right in the facts of his statements about driving bees at the Crystal Palace. I reply he is not. In the first place, before driving was commenced the bees had been in position three full days and were quite at home, working merrily. As to being 50 feet above the ground, did your correspondent never hear of a swarm in a high tree? and did he ever hear of parachutes being required by the bees in their visits to *terra firma*? In the second place, there was no general fighting whatever; doubtless a few single combats took place, but not sufficient to attract attention. That a good many bees were killed is quite correct, but it arose solely from being trampled on by eager spectators, the bees which had settled on the cocoa-nut matting with which the floor was covered being entangled by their feet and unable to move with their accustomed alacrity. All who are acquainted with the Palace will remember that the floor boards are separated by a considerable interval from each other; and the managers of the Palace, in their anxiety for the public safety, insisted on covering the floor with the matting in order that the bees should not penetrate beyond the glass partition. The fallen bees were thus most conspicuous, and although on the ground it did not necessarily follow that they were all killed. Many hundreds of bee-keepers who had read of driving, uniting, swarm-making, &c., but never saw anything of the kind done, here received the best of all instruction—actual demonstration, and went away confident in a new-found power, prepared to teach it to their neighbours, and the Committee were thanked in numberless instances specially for this part of the Exhibition. I and the Committee freely admit that many things might have been arranged better, and we thankfully acknowledge the unbounded consideration shown by exhibitors and visitors for all shortcomings in an undertaking that was most onerous, and a great cause of anxiety to none more than—JOHN HUNTER, *Hon. Sec.*

TO REMOVE FRUIT STAINS.—A solution of chloride of soda will remove peach and all fruit or vegetable stains, and is also excellent in removing mildew; but for this it must be applied several times, and exposed to the sun, while fruit can be removed by it instantly. Of course, it can only be used for white

cotton or linen goods. It is perfectly harmless, if well rinsed in clear water immediately after using.—(*Canada Farmer*.)

OUR LETTER BOX.

LIGHT BRAHMA COCK (M. B.).—The sum you paid (£4), should buy you more than a fairly good *Light Brahma* cock. It is the price of a very good one, and should be nearly faultless. At three years old he is not too aged to breed from, and the straw colour of which you complain is often seen as they grow in age. We should not breed from him if we had another. If we had not, we should put him to the perfectly white pullets you mention, and should expect good chickens. You do not state whether the bird was yellow when you purchased him, or whether the colour has appeared since.

WOODHOUSE'S NEST PANS (W. D. P.).—He is living at King's Lynn, Norfolk. Your letter must have been lost or mis-sent.

CHARACTERISTICS OF DARK BRAHMAS (Dark Brahma, Manchester).—The colour of your hens should be a delicately pencilled grey, every feather alike, and the colour free from moss or brown tinge. You will best judge of the requirements of the breed by attending some first-class exhibition and there comparing the winning birds with the others. You may keep *Bantams* running with your full-grown *Brahma* fowls.

RABBITS' EYES CLOSED (G. H. R.).—If your young *Rabbits* smell offensively we should advise you to kill them at once; but if they have merely their eyes closed from weakness, wash them with warm water and grease them with lard. Apply the same treatment to the scab. Foment and anoint frequently.

PRICE OF HONEY (A Constant Reader).—Large chemists readily buy wax at 2s. per pound. A large grocer who has had some of ours for years will give 2s. 3d. rather than let it go elsewhere. Two gentlemen offer 2s. 3d. per pound, by the hundredweight, for manufacturing purposes. Glasgow merchants ask us to quote prices. Everybody of course will buy as cheaply as he can, but we think you may find a market for your wax at higher prices than you now obtain. The 65 lbs. of honey taken from one of your hives is very good and encouraging. Many hives this year have not yet killed their drones. If the bees in your hive do not kill their drones soon, you may suspect that the queen is either lost or useless.

HONEY AT THE CRYSTAL PALACE SHOW (Young Apiarian).—We are unable to state what quantity of honey was exhibited at the Show, and if we were we should have no means of telling what proportion was sold, as about half the exhibits were not priced for sale. The Association received commission on about £80 for honey sold, and some lots are known to have changed hands without being reported at the office. Glasses of honey and small supers sold readily, but the large supers were mostly unsold, the difficulty of transit telling much against the sellers. About 1s. 6d. per pound seemed the ruling price of honey in comb, and a little less for run honey.

REMARKS.

- 7th.—Heavy rain till noon; shower in the afternoon; fine night.
 8th.—Fine day throughout; but misty evening.
 9th.—Morning dull; slight showers from noon till 2 p.m.; afternoon showery, with occasional sun-shine.
 10th.—Fine autumnal day, and cloudless night.
 11th.—Misty and rainy morning; rather better in the afternoon; damp misty evening. At 8.50 p.m., though nearly overcast, there was a very vivid flash of light from the bursting of a large meteor, which was seen simultaneously at Cambridge and Brighton. Had the sky been free from cloud it would have been very grand.
 12th.—Foggy early, but afterwards warm and pleasant; the night bright and starlight.
 13th.—Very foggy morning.
 Temperature very nearly the same as last week, but air much damper; in fact nearly saturated on several mornings.—G. J. SYMONS.

COVENT GARDEN MARKET.—OCTOBER 14.

No change. Some good *Salway Peaches* are coming in; other sorts are quite over. A fresh consignment of *St. Michael's Pines* has arrived; and there is also a fair supply of *English-grown fruit*, quite equal to the demand.

From observations taken near London during forty-three years, the average day temperature of the week is 56.3°; and its night temperature 53.7°. The greatest heat was 69°, on the 22nd, 1833; and the lowest cold 17°, on the 23rd, 1859. The greatest fall of rain was 1.03 inch.

AURICULA GROWERS IN THE NORTH.

It is a pleasing sign of the times that the taste for the fine old florists' flowers is reviving, and that these plants are being looked after much more than they used to be a few years ago. Auriculas are perhaps the most difficult to manage of all the flowers that were the favourites of our forefathers, and which, through their enthusiasm, have been brought to such a high standard of perfection. Young cultivators in this fast age will probably not have the large amount of patience requisite to raise first-class seedling Auriculas, and the old seedling-raisers are rapidly disappearing from amongst us. Mr. Robert Trail, of Aberlady, died some years ago, more recently Mr. G. Lightbody; and another grower, who has raised some good flowers—Mr. Kay—is also amongst the names of departed worthies. Mr. Peter Campbell, of Falkirk, has some seedlings which have not yet flowered, and others which he thinks good, but he will probably not sow any more seed.

At present Mr. Meiklejohn, Raploch, Stirling, has not only the largest, but most healthy collection in Scotland; he has about 1600 plants in all the best varieties, and the splendid condition in which he has his plants shows the care and skill bestowed upon them. They are grown in span-roofed and lean-to frames. The glass lights are placed at an angle of 45°. The span-roofed structures are 9 feet wide, and contain twenty rows of plants, which stand on a stage fixed at such a distance from the glass as will allow the trusses of flowers to be thrown up without coming in contact with it. One serious fault in the cultivation of the Auricula is that of keeping the glass lights too close; such treatment causes the plants to become weakly and susceptible to the attacks of green fly. Mr. Meiklejohn's frames are raised above the ground, so that the air plays freely both under and over the plants. If green fly should attack them, which is seldom the case, he destroys it with tobacco powder. As to the potting material, the nostrums of the old florists are utterly eschewed. We were pretty well agreed on this point, as well as with regard to the size of the pots. Pots from 4 to 6 inches in diameter are sufficiently large for all purposes, using the largest size in exceptional cases only. Loam and rotted cow manure are all that Mr. Meiklejohn uses in the way of compost; employing the manure in larger or smaller quantities according to the variety.

In such a large collection as that grown by Mr. Meiklejohn it is very interesting to note the special characteristics of the different varieties. Some of them grow freely and are always healthy in appearance, others are "dorty," seldom or never to be seen in good health. For instance, of that fine variety Marie (Chapman), which is grown here in quantity, I noticed only one plant that had not a sickly appearance, the pale green leaves being in each instance streaked and slightly blotched with yellow. Sophia, by the same raiser, is equally peculiar.

No. 708.—VOL. XXVII., NEW SERIES.

The following varieties are amongst the best of those grown at Raploch:—

Green-edged.—Alexander (Stretch) has been grown here for about six years, and no stock has as yet been obtained. A nurseryman would, of course, cut the plants over, and thus obtain numerous breaks; but without such assistance the result has been nil. Champion (Page) is a very slow grower, and except the large stock of it in the hands of the Rev. F. D. Horner, there are few other plants of it in Britain. Duke of Cambridge is generally a green edge with Mr. Meiklejohn, though Mr. Turner classes it in the greys. As a green it is a very pleasing flower. Prince of Wales (Aston) is good and pure. Colonel Taylor (Leigh) is fine, but the growers here do not speak in its favour. The flowers are small, and the petals pointed. Admiral Napier and Lord Palmerston were raised by Mr. Campbell from the same batch of seedlings; the first-named is a very free-growing good variety.

In *grey-edgeds* one of the very best is that raised in this neighbourhood by Mr. Kay, and named in honour of Mr. Meiklejohn. The flower which I saw of it in the summer was better than my own pips of George Lightbody. Col. Champneys (Turner), very fine and very free in growth; Conqueror of Europe (Waterhouse), Complete (Sykes), Lancashire Hero (Cheetham), Mary Ann (Fletcher), Matilda (Dickson), Marie (Chapman), Ne Plus Ultra (Fletcher), Richard Headly (Lightbody), Robert Trail (Lightbody), Splendour (Headly), Unique (Dickson), and Unique (McLean). A new one of Mr. Campbell's named Confidence is much thought of by Mr. Meiklejohn.

White-edged.—Catherina (Summercales), Earl Grosvenor (Lee), Fair Maid (Lightbody), John Waterson (Cunningham) is classed by the Scotch growers amongst the greys, whereas Mr. C. Turner in his list has it in the white-edged class; Ne Plus Ultra (Smith); Incomparable (McDonald); Glory (Taylor); Smiling Beauty (Heap) is said to be the best white edge; Sophie Dumaresque is new and very fine, with a very large truss. It is said to be one of Mr. Chapman's flowers, though it was sent out by Mr. Lightbody. White Rival (Trail) is a good flower.

A few of the very best *selfs* are Blackbird (Spalding), Eliza (Sims), Formosa (Smith), Lord Clyde (Lightbody), Master Hole (Turner), Petronella (Headly), Metropolitan (Spalding). This is said to be a scarce flower now; it is certainly very fine. Mrs. Sturrock (Marlin), Vulcan (Sims), Topsy (Kay), Pizarro (Campbell). The two new ones sent out this year by Mr. Turner are very fine—viz., C. J. Perry and Cantab.

I also visited Mr. Campbell at Falkirk. He has disposed of the greater portion of his stock, but still retains a few of the best varieties, and he has yet a goodly number of seedlings to prove. He has quite recently raised and let out two very fine crimson *selfs*—viz., Duke of Argyll and Lord Lorne, and he is yet working in the same direction. The two named have mealy foliage, and he is desirous of raising crimson *selfs* with green foliage. Lord Lorne was raised from Mrs. Sturrock, the pollen parent being Berry's Lord Lee; and he has now crossed Lord Lorne with a green-edged seedling having plain

No. 1562.—VOL. LII., OLD SERIES.

foliage, and the result is a crimson self with plain foliage. He will cross this, probably, for four or five generations before he has a flower of first-class quality.

Mr. Jeffery, a bookseller at Falkirk, has now a very large collection of the best named sorts, and, what is more, he grows his plants well, and has also taken to the raising of seedling varieties.

It will be seen from the above remarks that Stirling, which in the days of yore was the "bulwark of the north," is still the stronghold of the Auricula. In olden times kindly men lived at Stirling, and the race still remains in the persons of the old florists. The most pleasant days I spent in Scotland this year were with the florists at Stirling and Falkirk.—J. DOUGLAS.

NOVELTIES IN THE ROYAL GARDENS, KEW.

In the Stove are a few plants of *Reidia glaucescens*, an interesting and beautiful plant of unusual habit. The stem is erect and stout, bearing what at first seem to be pinnate leaves; they are, however, horizontal branches of definite growth, produced with such regularity as to favour deception; the apparent leaflets are entire leaves. In the axils of these are borne the flowers; and though small, they are produced in such numbers that there can scarcely be anything more pretty or graceful. Each one hangs by a slender hair-like stalk; they are red in colour, and have a nicely-fringed margin. It is a native of Java. Cuttings can be rooted at any season under a bell-glass. For potting, a mixture of peat and loam with a sprinkle of sand is quite suitable. Large pots are not necessary; very pretty specimens can be grown in 48's. It is fortunately not liable to be infected by insects. It has been distributed from Kew for several years, but is not very generally known. From the late demand it appears to be rising in favour. At night the leaves fold to sleep face to face like the leaflets of many Leguminosæ. *Begonia geranioides* is a very choice and distinct species of small growth. The petioles are red, supporting green blades that but slightly show the obliquity characteristic of the genus. The flowers are pure white and very numerous, on several pale green stalks well above the foliage. It has a tuberous rootstock, but is not quite so hardy as the majority of that description. A native of Port Natal, whence it was introduced by Messrs. Backhouse, and was figured in the "Botanical Magazine" for 1866.

The new *Cypripedium Roezlii* is now in flower in the Orchid collection. It does not differ widely from *C. longifolium*. A good variety of *Oncidium crispum* is just opening, in the same condition as *O. excavatum*. There is nothing prettier than a small pan of *Pleione Wallichii* with about sixteen of its rose-coloured flowers fully expanded. Among others worth attention are *Odontoglossum Uro-Skineri*, *Rodriguezia secunda*, *Mesospinidium vulcanicum*, the curious *Gongora galeata*, *Brasavola cordata*, and *Masdevallia Veitchii*. Besides these, numerous pots of *Calanthe vestita*, with *C. Veitchii*, render the house gay and attractive.

A large plant of *Coprosma lucida* planted in one of the beds in the Temperate house is now very ornamental from its clusters of orange-red berries. They are individually about twice the size of those of *Nertera*. The tree is of good habit, with dark shining oval leaves. It will not, perhaps, fruit in a young state. *C. Baueriana variegata* covered with berries in this way would be very pretty. Cuttings strike as freely as do those of that variety, which, we may remark, should be widely used for beds in summer out of doors.

CURLED PARSLEY

Is one of the most useful garnishing herbs or vegetables that we grow in the kitchen garden, when grown to perfection. I generally put in my first sowing about the middle of March, digging in some rich manure; when finished, put on the ground a mixture of soot and burned wood ashes, which I rake in, sow in a drill, and then cover with some old dry soil from the potting bench. I grow it along the edges of the Gooseberry borders, and it looks well throughout the winter and spring months. The second sowing I put in about the beginning of August on a south border, and the Parsley comes in very useful in the early part of the spring, and keeps me supplied through the summer, until the spring-sown comes in for use. I always cut the plants down twice during the season—May and July, and sow a little soot between the rows, which promotes growth very much, at the same time gives the leaves a fine green colour. In September or October a plantation may be made

from the August sowing in a frame or on a warm sheltered spot, where the plants will be likely to survive the winter. It is seldom that the winter affects it in this locality in the open ground. The varieties I grow are Myatt's Garnishing and Champion Moss Curled.—W. McPHERSON, *Snelston Hall Gardens, Ashbourne.*

FINE OLD TREES AT MOOR PARK, HERTFORDSHIRE.

FINE old trees have of late years been held so much in esteem, not by the mere lovers of nature only, but by the public at large, that even the owners hesitate before sacrificing them, lest the public should censure the act; besides which, the proprietors feel not a little proud of their possession, and instead of the reckless cutting-down of timber which took place in olden times, in many instances great reluctance is felt to thin them sufficiently for the welfare of those intended to stand. This undoubtedly is the better of the two extremes; and added to that are the laudable efforts made by many landowners to increase their extent of woodland; and every encouragement should be given to their doing so, as so many influences are at work elsewhere to diminish the quantity. Having, however, the subject of a well-clothed district in contradistinction to one denuded of trees for consideration hereafter in respect to their respective influences on rainfall and other features of meteorology, I will at once turn to that of fine old trees. It is at all times a pleasure to see a number of such trees, especially when we take into consideration the great temptations there have been at various times to cut them down for their commercial value. The great demand for ship-building timber at the end of the last and for some years of the beginning of the present century, induced many proprietors to cut down what otherwise might have been an ornament to their estate; but it is not likely the same demand will occur again, the many countries from which our timber supply is drawn, not to speak of the many purposes for which iron has now substituted timber, almost rendering the national song "Hearts of Oak" a thing of the past. All tends to help to preserve to us what remains of the fine trees of our ancestors; and where fine ones really do exist, and the owners of such are liberal enough to allow the general public under proper restrictions the privilege of inspecting such trees, I hardly know of any greater treat that can be accorded. All honour, therefore, to those who possess such riches and share them at the same time with their neighbours. I am pleased to observe that this privilege is fast gaining ground, and that the parks of many of our nobility are thus made accessible to all such as by their actions desire to be admitted; and what public or private feast presents a more true picture of a health-giving meal than is often seen partaken of by a party holding a picnic under an aged tree? The very site, its associations, not to say the purity of the air breathed by all, give it a charm which is wanting in the splendour of the formal dinner party. And how often do we see such a sight under some fine old trees in some gentleman's park! and, what is equally pleasing, how seldom do we hear of a privilege thus gracefully granted being abused! Let me hope the cases of the latter kind will get fewer and fewer. Those liberal-hearted noblemen and gentlemen who thus so kindly allow their fine trees to be thus inspected are certainly entitled to all praise at our hands, for are not old trees exempt from the suspicions that now and then cling to objects said to be old, as ironwork or chinaware, or even pictures? for old trees are not to be manufactured. Their hoary appearance is genuine. No "getting-up" is necessary on their part; they are perfect in themselves, and any tampering with them would only end in the discomfiture of the meddler.

Of the fine old Oak trees which ornament so many of the parks of our nobility, and at the same time form objects of historical interest, there are many examples in the kingdom; and perhaps those in the county of Hertfordshire are as important as any, and amongst those of the latter kind the fine trees in the park of Lord Ebury at Moor Park on the south-western edge of the county are especially deserving of notice. An outline of this fine place is given in the volume for 1871; and in noticing the history of the place a mournful interest is elicited by the fact of its having once been in possession of the unfortunate Duke of Monmouth, natural son of Charles II., who was attainted and executed by the successor of that monarch, when, it is said, the unfortunate duchess determined that the trees in the park should not be made available for the

royal navy, had them all beheaded. So says tradition, which, as is well known, is very often a good exponent of history. And some of the oldest trees in the park at the present day certainly bear traces of having been subjected to something of the kind years ago, and probably many more whose growth has since removed all traces of such an operation. But when we consider the long period that has elapsed since Monmouth's ill-starred rebellion there has been time for another generation of fine trees, of which there is no lack at the present day. It would seem that Moor Park, notwithstanding its vicissitudes, has been singularly lucky in the preservation of its fine old trees, and, what is equally important, the judicious planting of young ones; for in looking over it one finds trees of all ages, from the aged skeleton with scarcely a vestige of life upon it—(some one or two, in fact, are still preserved after ceasing to live)—to the young tree planted during the last ten years, with all intermediate ages between. The soil has perhaps had something to do with their longevity—a gravelly soil more or less mingled with chalk, although the latter is not just at the surface. A considerable diversity in the surface has also, no doubt, been beneficial, for we certainly always meet with the finest trees on hillsides rather than on plains; and the whole lies dry.

The park, though undulating more than the bulk of the surrounding district, has none of those wet valleys one meets with sometimes, the whole being dry, excepting that a small portion to the left of the entrance by the village of Rickmansworth, which lies close to the side of the principal river in the neighbourhood, is of course much moister, and one or two trees special to it will be noticed. I may here observe that Lord Ebury with considerate liberality allows picnic parties who have obtained leave to be held in the outside enclosure, which is kept much in the character of pleasure ground. The river forms its boundary on one side, and the high road the other; and immediately on entering, a ribbon border at the opposite side confronts you, which being backed by shrubs consists of partly hardy and partly half-hardy plants, and at the time I saw it looked well, the predominance of light-coloured flowers being well set off by the greenery by which they were surrounded. To those who are fond of having the contents of ribbon borders detailed, I may say the planting was as follows:—Commencing at back with the evergreen shrubs as a background—viz., back row *Helianthus multiflorus*, double yellow; next row African Marigold; next row Geranium, a tall scarlet; next row Verbena, a pale blue tall variety; next row French Marigold, striped; next row Geranium, pale-coloured variety; next row Lobelia, blue. The whole was edged with turf, on which at another place there were also some other beds of flowering plants, with now and then a fine tree. Notably so was a good Weymouth Pine, and a still more remarkable fine Tulip Tree, which must be 80 feet high, with a more upright growth than this tree usually has. Its bole at the height of 10 feet was divided into two leaders, each of which were upright-grown, and gave the whole more the habit of a Poplar than a Tulip Tree.

Entering the park we see an abundance of very fine Oak trees, with also some of other kinds, and near to the carriage road we find a fence has been put round two, one of which is dead. These relics of a bygone day, to which I believe some historic legend is attached, as being of the time of the unfortunate Duchess of Monmouth's period—these venerable remains of a time very different from our own are not so large as many others are; but as all trees alike do not attain the same size, we need only say that they would be esteemed very large everywhere, excepting in a place like this, abounding with large trees. One of these has a portion of one of its sides alive. This pair stands about 24 feet apart, and from the appearance would seem to be very ancient. Another Oak near the last-named has some appearance of having lost its top, or in other words of having been beheaded at 7 or 8 feet from the ground, yet is still quite healthy, and its bole measures 17 feet in circumference at the smallest part between the root-claws and breakings of its branches, and that too at a place where it seems to be sound. Another Oak, not far from the above, is 20 feet in circumference at the waist. This is also healthy, and like the former would imply a belief that it had been one of the beheaded ones. Another Oak is 19 feet in circumference, but is less healthy and sound-looking than the other; this also has the appearance of having been beheaded. Another same size of last, but more healthy—in fact sound, and does not appear to have undergone the ordeal the others have. Another Oak, a little way from the last, is 24 feet in circumference at

about 5 feet up, and the top healthy and fine. This is a most remarkable tree. As the measurements are all taken at the smallest parts within reach, it will be easily seen that larger dimensions could easily have been given. Another Oak a little way from the carriage road measures 31 feet in circumference at 2 feet up, but it is only fair to say there were a number of excrescences on the bole, which gives greater dimensions than ought to be the case, but it was a remarkably fine tree, for it would seem to be quite 16 or 18 feet in circumference at the height of 20 feet or more, and this without any of the swellings alluded to; its top healthy. Another tree near the last nearly as large. Besides the above we noticed a Sweet Chestnut with a fine straight bole, the bark of which had the common spiral twist or ribbing. This fine tree was 18 feet 6 inches in circumference at 5 feet up, where the bole was clear of all protuberance, and it must have been of large dimensions at 30 feet up. It was a remarkably fine tree, and certainly one of the best I have ever met with of its kind for timber purposes.

The above trees are all in the park, but there are some fine trees in the pleasure grounds also, notably so in that part of the pleasure grounds detached from the mansion called the Old Pleasure Grounds, an isolated portion of some 25 acres or more, which, amongst other riches old and modern, contains a most remarkable Spruce Fir tree, which at one time seems to have lost its leader near the ground, and instead of succumbing to the disaster, to have cut out for itself a new feature altogether, and formed a number of distinct leaders, now like large trees, which issue at various places around the original stock, and have every one the uniformity of seedling trees. The circumference of the largest at about 3 feet from the ground I found to be nearly 14 feet, an unusual size for a Spruce Fir; besides which it was evident its branches had at times laid themselves on the ground and rooted there, pushed up a fresh tree at their points, their connection with the parent tree still remaining a proof of their being part of it. I may add that the whole seemed healthy and likely to live many years, differing widely in this respect from what we see of Spruce Firs in many places, where they are liable to die at the age of thirty or forty years, or even less. Here we have a specimen with all the stamp and vitality about it of some of our deciduous trees, a marvel in its way. At some little distance from this was a fine plant of a lately-introduced Spruce which we seldom meet with in good condition, which I merely mention here to show that the soil suits such things. An *Abies Kämpferii* was upwards of 8 feet high and as much through, having lost its leader, or it might possibly have been 3 or 4 feet higher. Now when we consider that there are many places where this Conifer refuses to grow at all, even where other choice ones make rapid progress, we are led to think there are peculiarities in certain soils suited to certain plants, and notably so to this.

We must not omit noticing another fine Oak, which, although appearing to be perfectly sound and healthy, was 26 feet in circumference at the waist, and likely to live many years. Another near to it was about the same in dimensions, but was not so sound, although still healthy.

It might, perhaps, not be out of place here to mention that a fine terrace wall bounds the pleasure ground adjoining the mansion of something like 600 feet long, with thirty vases on the parapet wall, all filled with scarlet Geraniums. The walk by the side of this noble wall is 20 feet wide, and likewise perfectly straight; but as these features were all described in a former article they need not be repeated, neither is it necessary to repeat what was said on the kitchen garden, but in a hasty look over the latter a fine bright-looking Nectarine was pointed out to me by Mr. Cunningham, the very intelligent gardener, as being very good and deserving of more general adoption. It was the Pine Apple Nectarine, a handsome full-sized fruit, of the class coming in at midseason, and certainly a showy one for table.—J. ROBSON.

STRAWBERRIES.

I HAVE not seen Garibaldi mentioned in the lists. The following description of it may be of use to some of your readers:—It is of close compact habit, with a good constitution, is a free bearer, and in colour not inferior to Keens' Seedling. In this county (Durham) it is a general favourite; besides, it is an excellent forcer, and I depend on it principally for my supply. The fruit is of medium size and stands well above the foliage, a great recommendation in a wet season, and it comes into fruit from the plants that have been forced.

By attending to them during the summer months it can be brought into bearing at the end of September.—W. WRATHER, Gardener to Edward Pease, Esq., Darlington.

NOOKS OF SUSSEX.—No. 2.

My last note related to Yapton, and in a summer long since passed I had thence journeyed to near Goring, and inquired my road for a nook still further to the eastward. An old man directed me, but he added as a warning, "Rain's anewst [near]—old Mother Goring got her cap on." In other words, Chanctonbury Ring, a hill belonging to the Goring family, had a grey cloud covering its summit. Whether the prognostic was fulfilled I remember not, but I do remember that there and in the nook to which I was journeying linger many old sayings which I delight to hear and record. One of them says, "The old woman takes the cuckoo in her basket to Heathfield Fair, and there lets him out." That Fair occurs on the 14th of April, and the cuckoo is so usually first heard about that day that the Fair is called "Cuckoo Fair;" but who the old woman is I know not. Another bit of folk-lore learned as I journeyed on is that the Houseleek is cherished by cottagers on the thatched roofs of their cottages, because they believe it protects them from lightning.

Many times since that journey have I been in nooks neighbouring Heathfield. On an adjacent hill a modern mansion is erecting, from a turret of which a perfect panorama of the country round within a circuit of twelve miles is seen. Good taste is apparent in some portions of the garden, and it will appear in other portions as planting time progresses, for all is a new creation. I have been there more than once recently, for there are good wines in the cellar, and the housekeeper compounds superlative chicken pies. That is a mere parenthesis, for having mentioned the gardening I intended at once to proceed to some of the nooks of the garden, and of these I shall notice none but those devoted to Primulas. The first bed noticed was 45 feet in length and 3 feet in breadth, and on it were forty rows of Polyantheses, and six plants in each row. They were seedlings, and the labels by them recorded the colour of their flowers and their parentage.

Thence I walked to a border 140 feet long and 6 feet broad. In it were 119 rows, each row being filled by eleven plants. Each plant was named and noted as to colour and size. I will only mention one, called Purity, having white flowers, which it persistently produces during the winter. Two others, probably not in the same border, I mention because the raiser seems to have applied the names waggishly. One he has called Magenta on account of its flowers' colour, and the other Solfereno, its flowers being pale magenta. The Magenta is a winter-flowering variety.

Besides the bed and border I have mentioned there were Primula edgings; another bed, 60 feet long by 20 broad, containing more than eight hundred Polyantheses, and a border of nearly six hundred seedlings unproved.

Need I add that the proprietor of the mansion and garden is "PHILANTHOS," whose little book on "Primroses, Cowslips, Polyantheses, and Oxslips," is published at the Journal office?

I observed in my previous notes upon the fondness for gardening in some of the Sussex nooks, but I should have included orcharding. No nooks of any other county contain more old fruit trees, and varieties are met with that are quite local and unmentioned in books, though excellent. Where else can be found the Wheat Plum? and where is its superior for culinary use or for making a brilliant jelly-like preserve? Here I met with the Pruin Plum, a name quite local, but the fruit seems identical with the Mussel Plum of other counties. Of Apples the Woodcock, Hawkridge, and Duckebill seem to be confined to Sussex and the borders of its adjoining counties.

In these nooks are to be recognised dog-irons and fireplace-backs, used when fires were kindled on the hearth, and manufactured two centuries since, when iron-smelting was an extensive operation in Sussex. That smelting is now sought to be revived, and very probably with success. Railways have rendered the conveyance of coals, ore, and manufactured iron cheap compared to what it cost when the manufacture had to be abandoned. There seems no reason why it should not be remunerative here as it is in mid-Northamptonshire, for in Sussex, as there, the ore is part of the subsoil. If in addition the boring now in operation reveals a seam of coal, the advantage will be still more decisively in favour of Sussex; and the time may be near when, history repeating itself, I may have a modern record like that old one now before me, giving "an

account of the whole process of the iron work, from one of the chief iron masters in Sussex, Walter Burrell of Cuckfield, Esq."

In other nooks are the birthplaces of some of our oldest writers on gardening, but these I may be permitted to notice in other communications.—G.

THE FLOWER BEDS AT THE CRYSTAL PALACE.—No. 2.

TURNING now to the beds themselves, I found that the long Rose borders which originally stretched in an unbroken line from each intersecting walk along the outside of the upper walk on the rosery mound, had been broken up into a series of parallelograms of Roses alternating with circular flower beds, in which the enamel bedding was in fullest beauty. Elevated, as these beds are, very near the top of the steep sloping sides of the huge mound, with the beds of Roses acting as foils between every two circles, and with a bold sweep of turf downwards from them, they form very conspicuous objects, which certainly have that full share of general admiration which they so richly merit. Skirting the base of the mound, on the turf inside the lower encircling walk, there is another chain of beds, all of circular form, and planted in the old free style with Geraniums, &c.; all well filled and in excellent condition, but affording a striking contrast to the dwarf growth and bright unbroken beauty of the upper series of beds, compared with which they were extremely tame and insipid; and it was an instructive lesson to watch the hasty passing glance

Fig. 104.

| 3, <i>Alternanthera amona</i> . | |

bestowed on them by those who soon afterwards found themselves involuntarily pausing to admire the irresistible beauty and to study the designs of the enamelled beds. Let us join them, and see what else there may be to learn to enable us to apply the lesson in our own practice next season; and in doing this it will be best slightly to recapitulate.

Most of the beds have an edging of *Sempervivum californicum*, and where a brighter-coloured edging was necessary Golden Feather Pyrethrum was its substitute. *Colons Verschaffelti* is still a favourite for producing a deep rich central mass, and it was present in several beds in the form of bold central stars and other forms. A Maltese cross of it margined with Golden Pyrethrum, with deep blue, carmine, and the pretty maculated rosettes of *Sempervivum californicum* outside, as in fig. 104, was very fine. Now this bed, from the very simplicity of its design, offered a striking and not unpleasant contrast to the more complicated forms. "Grand simplicity" is no doubt a somewhat hackneyed term, but it is none the less expressive of truth and beauty. Another important matter in connection with this bed is the materials. Of the

five kinds of plants used the *Sempervivum* is hardy, and the *Lobelia* and *Pyrethrum* are raised from seed in spring, so that only the *Coleus* and *Alternanthera* would require protection in winter, and of these a few plants afford a considerable stock of cuttings in spring.

Taking another circle (fig. 105), as an example of how

| 3, <i>Echeveria secunda</i> glauca. | 6, <i>Coleus Verschaffelti</i> . |

Tagetes is used, we have a central star with eight points, containing a grand dark mass of *Coleus* with a margin of Golden *Pyrethrum*, *Tagetes* being most effective between the lovely yellow *Pyrethrum* and the rich orange *Alternanthera*. The patches of silvery *Echeveria* also told well, exercising very considerable influence upon the general effect, which was excellent. When grey-leaved plants are scarce or variety is necessary,

| 3, <i>Alternanthera versicolor</i> . | 6, <i>Coleus Verschaffelti</i> . |

Echeveria secunda glauca forms an excellent substitute, producing a somewhat similar effect in colour, and yet being totally different in its general appearance. It is used in figs. 105 and 106 in a very similar manner; but this last design is given as

an example of how two shades of rich crimson may be introduced in the same bed with perfect safety by the use of other suitable bright dividing colours. The effect of this bed was extremely rich, and not at all heavy.—EDWARD LUCKHURST.

A DAY WITH THE FUNGUS-HUNTERS.

ANOTHER Fungus feast, and no casualties! Once more have the mycologists, indigenous and other, hunted and harried the woods, fir groves, and pastures of Herefordshire, in pursuit of game which squires do not care to preserve, and to which farmers do not raise the faintest objection. Once more have they returned towards dusk to the "faithful city," bearing bags and baskets filled with spoil destined to give variety to more than one cuisine. So far has the adoption of the study of mycology, as a special feature of the Woolhope Field Club transactions, tended in six years to "Italianise" the tastes of diners-out in the matter of Fungi, that we believe the excellence of a "*Lycoperdon*" fritter might be avouched by the highest ecclesiastical dignitaries; and, unless our eyes deceived us, the High Sheriff of the county of Hereford could certify the goodness of "*Comatus*" soup. It is not, of course, contended that among the results of the forays which made the woods of Downton, Stoke Edith, Dinmore, and Garnstone, all alive in the first week of October, there were not a number of diverse Toadstools, wholly unfit for human food; but a residuum of edible Fungi was tried, tested, and not found fault with by the guests at the public dinner on the 1st of the month, who, though disappointed of the presence of the Rev. M. Berkeley, the chief of English mycologists, included in their number those scarcely less eminent authorities, Messrs. Broome, Rennie, and Houghton, to say nothing of that skilful delineator and describer of Fungus-growths, Mr. Worthington Smith, F.L.S. The proceedings of the evening included a merited recognition of the assistance rendered to the Club by this gentleman, whose two sheets distinguishing edible from poisonous Fungi, with the key appertaining to them (published by Hardwicke), are still the most useful guide to the amateur Fungus-hunter, though for more advanced inquirers the manuals of Berkeley and Cook, and, for the more classically minded, the charming volume of Dr. Badham, are, doubtless, more suitable. The delicately-served *Marasmius oreades*, or "Fairy Ring Champignon," enabled the veteran Mr. Lees to return for the hundredth time to his "molar" theory as to fairy rings; the Orange-milked Mushroom (*Lactarius deliciosus*) justified its title, after skilful cooking and a good deal of salting and peppering; and if on this occasion we failed to experiment upon the Scaly Agaric (*Procerus*), the Beefsteak that is cut to order from half way up the Oak (*Fistulina hepatica*), or the Boletus edulis (not that in favour with the elder Roman gourmands, though very popular with their remote posterity), or even the Giant Puff-ball (*Lycoperdon giganteum*), it is simply because, in the case of Fungus-tasting as in everything else, *non omnia possunt omnibus*. The *Lactarius deliciosus* ought to be good, to judge from its name; and its beauty of colouring and deep orange milk so completely distinguish it from the dangerous *L. torminosus*, the deadly and ruddy *L. rufus*, the fragrant and rare *L. glycosmus*, *L. controversus* (a species not uncommonly found under the Black Poplar, but on this occasion discovered by Dr. McCullough under a Lombardy Poplar at Garnstone), and the *L. Vitellinus*, which, notwithstanding its epithet, is not good for food, that there need not be the slightest hesitation in tasting it, even raw. Dr. Badham's plan of baking the *Deliciosus*, after due application of salt, pepper, and butter, for three-quarters of an hour in a covered pie-dish, is doubtless a preferable mode of experimenting on this delicacy. Our own experience of it is not so fortunate as to enable us to rank it with the most appetising of culinary Fungi, nor can we mention it in the same day with the slices of the Giant Puff-ball, when, after the removal of their outer integument, they are dipped in yolk of egg, and then fried in fresh butter. In all such experiments it is obviously unfair to try other than quite fresh and young specimens, and there ought to be no necessity for cautioning even the uninitiated against cooking the Puff-ball when it is yellow and rotten inside, or, indeed, when its snow-white exterior is beginning to change to a suspicious yellow. Several of the rarer *Lactarii* mentioned above were either found in this year's forays at Hereford, or were brought thither to adorn the sideboard at the festival.

A word must be added about the "*Comatus*" soup. What boy or girl accustomed to roam over field and pasture does not know the quaint cylindrical "tall John," with a fleshy and

patchy white wig, and a hollow stem with a white powdery fragile ring encircling it, known to mycologists as the "*Coprinus comatus*," and sometimes as the "*Agaric of civilisation*;" but hardly less familiar to hundreds who cannot put a name to it, and who come across it and its grey-capped cousin *C. atramentarius*, in the open garden or at the base of stumps or palings? This Fungus has long been mixed with others in the composition of ketchup, and *Atramentaria* is said to make very good ink. It has been reserved for the Woolhope Club to demonstrate its value as the principal ingredient in a piquant and tasty soup, to outward appearance resembling Green Pea soup, or, perhaps, more closely Parsley and butter in a tureen. Whatever its semblance, it is too good an addition to our list of soups to be lightly forgotten; and, perhaps, the day will yet come when those philosophers whose mental grasp can embrace nothing higher than the addition of another and another novelty to their gastronomic pleasures, may learn to count amongst their benefactors the motley group of mycologists whom an inscribed festoon in one of the streets at the recent opening of the Free Library at Hereford, designates irreverently and illiterately as the "*Fungi Fogiee*." After all, however, even putting the question of edibility aside, it is not difficult to find good reasons for prosecuting the study of mycology. Medicinally and industrially many Fungi have their special purpose, as for instance the scaly *Polyporus*, which, dried and cut into strips, supplies a capital razor strop, and the other species of the same group which are manufactured into the styptic known as *Amadeu* or *Germanu* Tinder. The medicinal substance known as *ergot* of rye has also, it need hardly be said, a fungoid origin. Generally, too, to quote the highest English authority on the subject, "the office of Fungi in the organised world is to check exuberant growth, to facilitate decomposition, to regulate the balance of the component parts of the atmosphere, to promote fertility, and to nourish myriads of the smaller members of the animal kingdom." Regarded in this practical light, the numerous family of *Fungus* asserts a strong title to intelligent study, and cannot lightly be overlooked by any Field Club that deserves its name. An attempt to catalogue the Fungi which line the woodland path, or have their habitation at the foot or amid the branches of the Oak, Ash, Elm, the Larch, and Fir, the Birch and the Poplar, would very soon more than exhaust our paper. Amidst the things of beauty—though certainly not of joy to the incautious taster—in *Fungus* life may be cited the *Boletus luridus*, amber-coloured above, and bright red or even vermilion below, and suspiciously changing, when broken or bruised, to a blue complexion. Or, again, the Fly *Agaric* (*Agaricus Amanita muscarius*), with its bright scarlet cap, worked, so to speak, with yellow or yellowish spots, and underlaid with a bright yellow flesh, which is succeeded, lower still, by a pervading white. Its stem is bulbous and marked by a distinctive ring. The *Peziza aurantia* is another perfectly lovely tenant of the woods and heaths, a delicate crisping "lamina" of the brightest orange, which no one will forget who saw the other day a specimen of it measuring 8½ inches across, sent from Shobden Court by Lord Bateman. Amongst the *Russulias*, found freely this year as usual in Herefordshire, there is as great a variety of hue as of wholesomeness, from the pale pink and faint rose to the brilliant scarlet of *R. emetica*. *Cortinarius cinnabarinus* is a clustering group, of a bright orange or nearly vermilion, with a metallic lustre. The *Cinnamon Mushroom* (*Cortinarius Cinnamomeus*) appeals to the sense of smell as well as of seeing, and there are several Fungi of which the recent expedition furnished specimens which make the former appeal without any pretence to the latter. Before glancing at these we must just name the violet-capped *Agaricus eucureus*, found at Dinmore Woods on the 30th of September; the *Coprinus piceus*, or *Maggie Coprinus*, a rare roadside Fungus met with near Downton, the membraned cap of which is variegated with broad white scales, whilst its gills are free and of an ashen black; the mouse-grey *Agaricus gloiocephalus*, of which a large group was exhibited by Dr. Chapman from off the pastures of Burnhill; and the rare, pale-yellow, crisped *Sparassia*, which has been more than once imported into these shows from the Fir groves of Chetwynd, by Mr. Houghton. We must also say a word on the odorous Fungi, whether sweet-scented or the contrary. Of the first sort there were found at Stoke Edith, *Lactarius glycymeris*, and *Agaricus fragrans* and *odorus*; of the second, at Dinmore, the *Agaricus cucumis*, in an abundance commensurate with its strong odour, suggestive of rancid oil or stinking fish. *Ag. saponaceus*, too, was offered to our scrutiny, but pronounced,

after deliberation, to savour more of fish oil than of soap; and the interest displayed in Dr. Chapman's fine group of *Gloiocephalus* was to a certain extent qualified by its exceedingly repulsive smell. Occasionally in the course of the forays one lighted on a family of Fungi, such as *Agaricus mucidus*, the associations of which are more with the touch than the sight or smell. Unpleasantly slimy, it arrested the notice of the Woolhopians by its profusion at a certain point in Stoke Edith woods, both on the ground itself, and on the tall fine-grown Beeches which are its home.

The mention of these sylvan beauties suggests another element of interest in Fungus-hunting—namely, the introduction it gives one to the finest timber in our land. As we have said, the Fungi love the greenwood. And if, in the recent excursions around Hereford, the curious in such matters were too late by a couple of centuries to see at Stoke Edith the Elizabethan house of many gables, long since superseded by the present stately quadrangular mansion, or at Garnstone the original and characteristic mansion as it appeared in 1675, and was represented in Dingley's sketch, known to readers of the Camden Society's publications, in the place of which is a castellated mansion built by Nash, yet in each case they might have made acquaintance with giant Oaks and stately Elms which perchance have been the silent witnesses of changes yet earlier than these; Oaks and Elms still betraying no traces of decrepitude, and still, as of old, giving grace, dignity, and picturesqueness to the landscape. It is not every day that one sees anything so perfect in its way as the great hall at Stoke Edith, the walls and ceilings of which were painted by Sir James Thornhill, or as the geometric flower garden designed by Nesfield; and yet an explorer might be still better employed in threading the paths of the richly timbered deer park, and making his way to the broad and lofty ridge of Seager Hill, whence he may look out upon the country towards Gloucester, Monmouth, Abergavenny, Bromyard, and Salep, to say nothing of the hill and valley of Woolhope nestling close beneath his standpoint. And so with the demesne of Garnstone; the predominant charm is in the deer park and the heights that bound it, the latter commanding exquisite views of North and East Herefordshire, as well as of Shropshire and the mountain barriers of Radnorshire, the former affording a study of single trees and clumps and groups of extreme beauty, such as is not often to be met with. Here a couple of Scotch Firs, there a noble Spruce or Silver Fir, arrest the eye by their perfectness of symmetry, or their rich contrast of form and colouring with their surroundings. Groups of Spanish Chestnuts, clumps of Elms, or avenue-like arrangements of the same, promising Wellingtonias, and the like, show how much good taste may achieve without the aid of a professional landscape gardener, where the proprietor finds himself possessed of an over-abundance of fine timber, and approaches the task of thinning as a labour of love. Within the lawn and sunk fence at Garnstone, the mycologists were as much struck with the thriving *Conifera* of comparatively recent introduction as with the special denizens of the turf in quest of which they had come. There were perfect samples—for their age—of the *Picea nobilis*, *cephalonica*, and *Pinus*, as well as of the Californian *P. bracteata*, the leafy-bracted Silver Fir, a very promising young tree, which, perhaps on account of a well-chosen aspect, shows here no tendency to premature starting into growth, and thus is less affected by late spring frosts. The complaint of this species generally is the tenderness of its younger growths.—(*The Saturday Review*.)

THE LATE MR. JAMES BETTERIDGE.

ANOTHER old florist has passed away from among us, one of those who, devoting their time to one speciality and doing it with zeal, have thereby conferred a boon on horticulture. To the world at large Mr. James Betteridge was known by the success which had attended his culture of the quilled, or as it is now somewhat arbitrarily called, the German Aster; and the stands which he used to exhibit at the Crystal Palace and elsewhere were of such surpassing excellence, that his strain was sought for by everyone desirous of growing that particular sort. Mr. Betteridge was a farmer, farming his own land, and gardening was to him a real relaxation and pleasure. He was an ardent lover of the Tulip, and wherever the National Tulip Show was held he was pretty sure to be found. I never had the pleasure of speaking to him but once, at one of the autumn exhibitions of our Metropolitan Floral Society, but those who knew him speak of him as a kindly genial man; but all will

regret to hear that one who has so much added to our pleasures has been removed from us; but we hope there are others prepared to carry out still further the improvements he had made. D., Deal.

HEATING BY GAS.

I FELT very much interested by reading Mr. Shaw's experience of a gas-boiler. I have not at any time been able to ascertain exactly what amount of gas was used in those I have had to look after; but I am quite certain that gas is much more expensive than coke or coal where it is employed to heat a house containing plants requiring a continual heat. If only for a greenhouse to keep out frost, or to dry the house in damp weather, it is much cheaper than anything else that can be used.

The advantages are—being able to have gas in a place where it would be impossible to have a stovehole, and also to light it in a moment when you find frost coming on, and being able to regulate it to a nicety. Where a coke or coal fire is used, we are obliged to light a fire in the afternoon to have it in readiness when we are doubtful about frost, and often enough the labour and fuel are wasted, for when bedtime comes a change has taken place in the weather and fire is not required. With gas you can wait until the last moment before applying the match. There is the difficulty about getting the gas mentioned by Mr. Shaw, and anyone intending to use gas should consider a little before commencing. If the locality lays very low the pressure will be lost to a great extent, and this is one of the evils; but I think for a cool house enough could be had in any place.

The dimensions of any house to be heated by gas should not be much larger than what are mentioned by Mr. Shaw. The grand point of all is not only having a good boiler, but having it properly fixed. The apparatus should be quite close to the house and built-in, not leaving more than a foot space all round, with a door large enough to get the boiler out if required at any time. If placed in a shed the heat is lost, then there is failure. If it cannot be placed close to the house care must be taken to ease the pipes, and fill with sawdust or felt, and they must be watertight. If the heat is not confined as stated, a great quantity of gas will be consumed, and the heating will prove a failure after all.—M. B.

I THINK your correspondent (October 8th), has made a mistake in using 1-inch barrel instead of a sufficient quantity of ordinary 2-inch hot-water pipe, and in consequence he lacks sufficient surface-heating power, so that it is scarcely justice to pass condemnation on the boiler where evidently the blame is not attachable. Had the proper size and quantity of pipe been used, he would have found that instead of the "temperature falling considerably," as stated, after "eleven," it would not have fallen more than a few degrees even in the most severe frost, of course taking into consideration that his house is well built.

In reference to the cost of gas, I may state that where one person burns sufficient to cost 9s. per week, another person would get the same effectual result by only burning two-thirds the quantity. Your correspondent draws his estimate, I presume, from the boiler being on full during the whole of the day and night. This is seldom if ever necessary, as if the pipes have first been got hot at full pressure, the consumption can be materially diminished without inconvenience or loss, but, on the other hand, will prove a gain to the consumer. However, supposing it is as stated by your correspondent, I cannot but think he has, on the other hand, forgotten to take into consideration the fact of a coke or coal furnace in like manner being kept roaring all day (but am rather inclined to think he has allowed for letting it die out in the daytime), otherwise I should like to ask the question, How will he manage to keep a furnace boiler going day and night for twenty-four hours, and get it properly attended to during that time for the sum of 9s. per week, to say nothing of the inconvenience of having to turn-out in the early morning in order to keep Jack Frost from feasting his keen appetite upon his much-prized plants? I shall feel obliged if you can find space in your next issue for these few remarks, as I fear from the desponding nature of your correspondent's communication, it will have the effect of damping the ardour of many an amateur.—M. LEAN.

JASMINE FRUITING.—Arthur Sanders, Esq., Hazelmount, near Ryde in the Isle of Wight, has sent us specimens of Jas-

mine berries, quite ripe, gathered from the south wall of his house.

TREDREA,

THE SEAT OF M. H. WILLIAMS, ESQ., CORNWALL.

It is at all times agreeable to find something remarkably good at a place where it is least expected. Many years ago I remember finding on the verge of Bolton Moors, in Lancashire, as well-grown a collection of stove plants as the foremost London exhibitor could produce, and in the following February some very excellent Grapes at an equally out-of-the-way place still farther north. Unexpected treats of the kind are, however, by no means uncommon, and on a recent journey I met with one of these surprises; this time, however, in the far west and not in the north. Pleasantly sloping towards the sun, on a bank of one of the tidal streams which form branches of the great Falmouth harbour, the traveller sees through the trees which skirt the road some glass structures and other tokens of a well-kept garden; an inquiry soon elicits the information that the place we are looking at is Tredrea, the seat of M. H. Williams, Esq. Through the kindness of a friend I was introduced to the able gardener, Mr. Merton, my expectation being that most likely many half-exotic plants would be there luxuriating out of doors, together with healthy Camellias, Rhododendrons, and the like, and this anticipation was fully realised, whilst under glass many interesting Orchids and other stove plants are cultivated, some specimens of the latter far exceeding those often met with in the most celebrated plant-growing establishments near London.

I will, however, just take a glance at the place before entering on its details. Tredrea occupies a site not far from the Perranwell station on the West Cornwall Railway, and near what appeared to me an unusual interruption to the quiet repose of a country district, an iron foundry and other works resounding with the tones of the heavy forge hammer. The tidal stream also floats-up large masses of timber. An excellent road, equal to any highway in the kingdom, and leading, I believe, from Truro to Penryn, skirts the property, the mansion and grounds being separated from the road by a belt of trees, through which a carriage drive soon enables the traveller to reach the garden, the mansion, however, first passed; and it, like the garden and grounds, carries the slope to the valley, in which is the armlet of the tidal water previously referred to. The slope of the ground that may be called dressed was all in one direction, and though quite steep enough for kitchen-garden tillage, was not too much so for turf and pleasure-ground purposes. To the latter attention will be first directed, premising that the mansion facing the same way, the chief portion of the grounds is in continuation of its left wing.

As I have on a former occasion mentioned that several plants usually grown under glass are in Cornwall often met with out of doors, I will not now repeat those before named, although most if not all of them were represented here; but what struck me as remarkably fine was a Camellia growing against a wall and occupying a space 18 feet by 10 feet, with the probability of soon requiring double the space if it was to be had. A fine *C. Donckelaari*, which was taken up and planted again in 1873, hardly showed any symptom of having been moved except in a more restricted growth. Some other kinds were also growing against the same wall with equal vigour, the aspect being south-east; but aspect and wall did not seem to make any difference, as all were good. A bed was shown me, now grown into a mass, the plants of which were very small when bought at a sale in Covent Garden some years ago. Azaleas were also flourishing, while on a border at no great distance from the Camellias were the remaining stems of what had been fine flower spikes of *Lilium giganteum*, 11½ feet high, which must have been magnificent. Not less so were some *Hedychiums* growing with all the vigour of *Cannas*, and what was more, the rich and much-valued *Vallota purpurea* was equally promising outside; although it had not reached the flowering condition at the time of my visit, there was every prospect of its doing so ere long. Other Liliaceae and kindred plants were also duly represented, as well as *Cyclamens* in abundance. On the lawn I noticed a fine tree of *Picea Nordmanniana* that was bearing cones, and in the kitchen garden an excellent Peach wall some 12 feet high well covered with healthy trees. I ought also to have noticed a very good deciduous Cypress, and I was told that *Echeveria secunda* and its varieties were quite hardy.

Turning to the glass structures my attention was arrested by the vigorous condition of most of the plants, more especially Orchids, which were divided into two classes—stove and cool-house Orchids, and their condition showed unmistakably how well Mr. Murton understands the culture of both, so as to give to each species the heat necessary to grow it well, a distinction which in a great many cases is not at all understood. All were in the most vigorous health, but I only took the names of a few, among which were the following:—

Lælia anceps, with seventy flower scapes; a very fine plant, promising to be even finer another year.

Lycaste cruenta, a very large and fine plant, likely to bear dozens of flowers.

Cattleya Dowiana, a very large fine plant, said to have produced a large number of flowers.

Cattleya crispata, by some called *Lælia crispata*; a very fine plant, having at the time of my visit nine spikes and nearly one hundred flowers out, besides which it was equally promising for the future.

Cattleya Mossiae, very good and large. I believe this was one of the approved varieties of this fine Orchid.

Dendrobium Bensoniae. A large and very fine plant of this species was said to have been beautifully in flower some time ago.

Dendrobium chrysanthum. Mr. Murton thought this about the best of some fifty or more *Dendrobies* he was acquainted with, and the plant he had was certainly a promising one. He thinks there are more varieties than one of this species, and that the best of these has the richest colour of the family.

Renanthera coccinea, a very fine specimen; had been highly ornamental when in flower.

Oncidium ampliatum majus. An immense mass of this. Very good.

Oncidium of several other species, of which I did not learn the specific names, all good, and all occupying the cool house.

Dendrobium eburneum. Although there was a very large plant of this choice showy plant, yet Mr. Murton thinks *D. chrysanthum* is superior; as it was, this was equally good as a plant.

Calanthe vestita, also very large and fine.

Phalenopsis Schilleriana, a large plant also. I understood had been very fine and good.

Vanda tenuis, also very large and fine.

The above are only given as a few of the many fine Orchids cultivated at Tredrea; and in regard to their being all so large, it may be said that there is not the motive to multiply them as is often done in a nursery, and sometimes also in private gardens. Here it would seem that a really good specimen is more valued than several small ones; hence almost everything was large and fine. And as an example of what plants were common at this place, I may mention that there were two masses of that old but universal favourite *Vallota purpurea* in full flower in pots at the time of my visit. On one of them I counted thirty-six flower-spikes all bearing large brilliant flowers, and the other had twenty-five spikes. Two such noble plants are not to be met with every day, and a few such would have much weight at a flower show. I may add that *Rocoea falcata* was equally good; indeed all flowering plants were so, as were some Ferns; but stove plants, having only their foliage to recommend them, were not encouraged. Although more extensive collections are to be met with, I doubt whether there are any really better grown; it consists, too, of only the best kinds, all inferior ones being discarded.

I may, perhaps, be pardoned mentioning that one of Mr. Murton's neighbours is an experienced traveller, whose name is well known to all who care for what is really good and choice of the trees and shrubs of the mountainous parts of South America, and his name is associated with Orchids as well. I allude to one of the Mr. Lobbs, for there were two brothers, both collectors of plants, one in the east and the other in the west. One, I believe, is now no more; the other still lives in this part of Cornwall, his native home, his health having suffered, as may be expected, from the privations endured in his travels. With such an intelligent neighbour we might almost envy Mr. Murton, while the intending exhibitors of Orchids at forthcoming shows would be likely to envy his fine specimens which comparatively few will see, not that they are ever denied to anyone, but the place is out of the track of those who usually cultivate such plants—a fact which reflects the more credit on Mr. Williams and his gardener for their being so good.—J. RONSON.

TALLIES.—A cheap and unobjectionable tally for outdoor work is still a desideratum. After trying several sorts, I give the preference to Maw's earthenware No. 5, though very

brittle. I write on them with a solution of chloride of platinum thickened with a little gum, and then make them red hot in a clear fire. The writing is permanent, but as it is difficult to write neatly on the earthenware, I generally use numbers, though this again involves the trouble of keeping and referring to a book.—G. S.

NOTES AND GLEANINGS.

WE are informed that an INTERNATIONAL HORTICULTURAL EXHIBITION will take place at ANTWERP, commencing on April 4th, 1875, under the auspices of the Royal Society of Horticulture and Agriculture of that town, and promises to be on a large scale. An INTERNATIONAL EXHIBITION OF FRUITS will also be held at AMSTERDAM in October, 1875, under the management of an influential committee.

A NEW HORTICULTURAL GARDEN has been opened at ST. PETERSBURG under Imperial patronage. It is fifteen acres in extent, and is to be devoted principally to illustrate how native plants may be combined for pretty and tasteful decorations. One large portion is to be devoted to Conifers, in order that there may be, even in winter, green promenades.—(Nature.)

SOME LARGE WALNUTS have recently been on view in Covent Garden Market, weighing as much as 5½ ozs. when gathered. They were grown at Teddington, and are well-flavoured perfectly-formed fruit.

ON the 14th inst. the Right Hon. the Lord Mayor, Sir Andrew Lusk, M.P., and the Lady Mayoress entertained the Master, Wardens, and Court of Assistants of the FRUITERS' COMPANY, in accordance with an ancient custom, at dinner at the Mansion House. The invited guests also included the Masters of the Merchant Taylors', Mercers', Masons', Musicians', Painters', Pewterers', Plasterers', Pontleers', Saddlers', Skinners', Spectacle-makers', Stationers', Tallowchandlers', Turners', Vintners', Weavers', Bakers', Barbers', Blacksmiths', Broderers', Butchers', Carpenters', Clockmakers', Clothworkers', Coach and Coach-harnessmakers', Cordwainers', Distillers', Farriers', Girdlers', Glass-sellers', Joiners', Leather-sellers', and Loriners' Companies. The dinner was served in the Egyptian Hall, and was principally given to the Fruiterers' Company in commemoration of the settlement long ago of an old grievance between them and the Corporation, arising out of the Lord Mayor for the time being from year to year in ancient times claiming a metage on fruit brought into the City market. This impost became so irksome to the traders that at length it was commuted into a voluntary offering by them to the Chief Magistrate annually of a choice selection of fruits of the season, he in turn inviting them to dinner at the Mansion House.

ATTENTION is being again directed to the CULTIVATION OF CINCHONAS IN ST. HELENA, which at one time promised so well, but which has, owing to changes in the Government, been allowed to lapse into decay. Some seven or eight years since, when the island was under the governorship of Sir Charles Elliott, Dr. Hooker strongly advised a trial of the plants to be made, and plantations were formed at Diana's Peak. So satisfactory was the progress of the plants that the Government consented to the selection of a gardener from amongst the best or most intelligent of those to be obtained at Kew. One was chosen and sent out, and, to quote from a recent number of the *St. Helena Guardian*, "All went well so long as Sir Charles Elliott was at the head of affairs: plantations were formed, and the gardener, Mr. Chalmers, was treated as one having the charge and responsibility of an important colonial experiment, and the plants grew well up to the time when Sir Charles Elliott left and Admiral Patey was appointed in his stead. The new governor at once decreed that the plantations at Diana's Peak were a mere foolish waste of money, that the gardener sent out from Kew would be better employed at Plantation House, and employed he was, chopping firewood and raising Beans, Peas, and Radishes, and selling them for the benefit of the privy purse of Government House, and the Cinchona plantations were left to go to ruin or to flourish by their own unaided vigour, as the case might be." The result of three years' cultivation and three years' subsequent neglect seems to be, that although there are a few dead and sickly plants, nearly all the trees are in full vigour and luxuriant growth. There are about three hundred flourishing plants, many of which are 12 feet high, and 3 to 4 feet in diameter. The bark is also a quarter of an inch thick, and has an intensely bitter quinine taste. Many of the plants in the St. Helena

plantations have the lower part of their stems bound up with moss in order to try if the bark would not swell and increase more rapidly; but it has had the effect of showing, by the bursting-out of rootlets from the part so bound with damp moss, that the plant throws forth roots readily from the bark, and thus may be easily propagated by cuttings. The Government has recently been again in correspondence with Dr. Hooker on this subject, and it is to be hoped that the cultivation will be again renewed and prosecuted continuously.—(*Nature*.)

—We learn from the "Belgique Horticole" that that cryptogamic pest the *Puccinia Malvacearum* is making sad havoc among the Mallows and Hollyhocks in some parts of Belgium.

—PROFESSOR GABBA has been examining THE EFFECTS OF AMMONIA ON THE COLOUR OF FLOWERS. It is well known that the smoke of tobacco will, when applied in sufficient quantity, change the tint of flowers; but Prof. Gabba experiments by pouring a little ammonia liquor into a saucer and inverting a funnel over it. Placing the flowers in the tube of the latter he finds that blue, violet, and purple-coloured blossoms become of a fine green; carmine and crimson become black; white, yellow; while parti-coloured flowers, such as red and white, are changed to green and yellow. If the flowers are immersed in water the natural colour will return in a few hours. Professor Gabba also found that Asters acquire a pleasing odour when submitted to the fumes of ammonia.—(*English Mechanic*.)

—THE volcanic soil in the neighbourhood of Vesuvius is stated to be an antidote to the Potato disease and other fungoid diseases of plants. It is also said that it is found of great value in the treatment of Phylloxera; this, however, remains to be proved.—(*Nature*.)

—THE PHYLLOXERA has appeared in Switzerland, and the delegates of the wine-growing cantons met on the 5th inst. to consider the best means of preventing its extension.

—THE consumption of OSIERS for various purposes, in England especially, is very great. Besides her own production, this country imports more than 5000 tons, valued at about £40,000. About three hundred varieties of Osiers are known, the most important beds being situated near Nottingham. The home produce being insufficient to meet the demand, great attention is being paid to the cultivation beds in Australia, and a considerable quantity is yearly produced in that country.—(*Nature*.)

THE BEST CURRANTS.

THE old Red Dutch and White Dutch are good reliable sorts, and we would not advise anyone who has them growing in his garden to throw them out. Larger Currants, however, may be picked more readily; they make a finer show on the table, and they last longer on the bushes without drying.

The two sorts that we place above all others, therefore, are the White Grape and Versailles or Cherry. Mixed together they make a beautiful table dish. The only drawback of the White Grape is the slow and straggling growth of the bush; but this objection is obviated by giving them clean and mellow culture, applying manure occasionally, and keeping them sufficiently pruned. It will not do to neglect them, and to allow them to become enveloped in grass and weeds—the usual fate of Currant bushes with careless managers. The Cherry, on the other hand, is a strong grower, and does not absolutely need such generous treatment, but it is better to cultivate it well, and prune the bushes as they require it. Our own bushes of the Cherry, which have stood in the garden fifteen years, are three times as large as those of the White Grape planted at the same time, and they always bear profusely. When allowed to hang long, and become fully mature, they lose their objectionable acidity, and are a rich and agreeable berry.

The Versailles is so nearly like the Cherry, that if the planter has one he need not take the trouble to procure the other, although the bunches of the Versailles have the advantage of being rather longer.

The Victoria and Prince Albert are good very late varieties—the former red, the latter pale red—a few of which may be planted for a succession.

All that is absolutely needed in the pruning which we have alluded to is to cut out the old and enfeebled wood, to give the younger shoots, evenly distributed through the bush, a better

chance to grow. This will make large bunches and berries.—(*Country Gentleman*.)

THE BEAUTIFUL AND USEFUL INSECTS OF OUR GARDENS.—No. 26.

IN view of the great destruction of life that is ever going on in the insect world, it has been suggested that the phrase of "dying a natural death" can have hardly any meaning there. So many insects have their lives cut short by quadrupeds, birds, reptiles, fishes, and by their own brethren, besides what they are liable to from the hand of man and atmospheric influences, that to die thus suddenly seems the more natural mode, and death by decay or old age rather out of the usual order of things. We know that it is almost impossible to find a dead donkey, and though this cannot be said of insects, the number of bodies one sees about of creatures belonging to this race is comparatively small; for those that are suddenly killed are often as suddenly eaten up, even to the fragments. And in the case of the few insects that die peacefully, their friends have never any occasion to resort to cremation, as mites and other small creatures are generally at hand to reduce the carcase to a mere shell. Some birds also, as is well known, though they will not usually eat dead insects, hunt up beetle elytra and moth wings to interweave with their nests.

The Scorpion Flies (see fig. 107), however, frequent visitants to the garden during the summer season, prey upon living insects in their imago state; the larvae, about which not much is known at present, are conjectured to feed upon the roots of plants. That they live under the earth is certain. Whether they are strictly vegetarian may be questioned, since it is quite possible that, like the flies into which they develop, they may not withstand the temptation to devour anything alive that they come across in their subterranean rambles, and which it is in their power to master. A glance at these insects as they dart about amongst the leaves in the sunshine at once suggests to the looker-on their affinity to the Dragon Flies, though they are not so agile nor so fiercely carnivorous as their relatives. But I have no doubt a Scorpion Fly can put away in a day a fair number of small insects. As two or three species are reported to feed upon those leaf-rolling caterpillars which the gardener finds it so difficult to deal with, we have reason to be obliged to them. I have myself frequently seen them on bushes which were swarming with caterpillars, but could not detect them in the act of tearing these from their abodes—an act, nevertheless, which it is most probable they perform, and for which the long head with its powerful jaws and the spined feet are particularly fitted.

History carries back the name of Scorpion Fly to the days of Aristotle, who fancied these insects were winged scorpions of diminutive size, though in the mind of some a doubt may arise as to the identity; for, of course, Aristotle did not leave us a figure of the Scorpion Fly he knew. The joints of the abdomen do suggest a comparison between the two. Other observers have seen a resemblance between the shape of the head (in one species at least) and that of the horse. We miss the brilliancy and lustrous beauty of the eyes so observable in the Dragon Flies; but yet these organs are keen enough in the Scorpion Fly tribe. The wings are gauzy, as in the Dragon Flies, and spotted with shades of grey and brown, while the forceps at the tail of the male fly indicates another resemblance; this is said to have strength to pierce the human skin, but I incline to doubt this. The females, unlike the Dragon Flies, have an ovipositor or egg-placer, rendered necessary by the mode in which the eggs are deposited, otherwise they are equipped as are their partners, and they subsist in the same manner. The legs of these insects, to which allusion has already been made, are well worth looking at under a moderate magnifying power, as they are surrounded with finely-cut spines arranged in rings, while the "knee joints" are fringed and spurred, and the extremity of the foot bears toothed claws, which have been compared to those with which some spiders are furnished. The Panorpidæ fall into that division of the Neuroptera where the pupa state is inactive, and they are nearly allied to the Hemerobii, or Lace-wing Flies, the notorious foes of the aphids. We have five British species, the most familiar of which is *P. communis*, supposed to be partial to places that are damp or low, in preference to elevated lands. This may be connected with the habits of the larva. There may be more than one brood of these flies in the year; if so, the winter would be passed in the egg state, the eggs first laid in the summer producing larvae that grow rapidly, and deve-

lope into flies ere the weather has begun to get cool, leaving behind them eggs for the next season. The larvæ of the Scorpion Flies are cylindrical in shape, studded with tubercles, and with short fore-legs; the head, somewhat flattened, facilitates the burrowing operations that are essential in their mode of life. Having reached maturity, each one scoops out for itself a cell, and there becomes a singularly squat pupa, exhibiting not much resemblance to the perfect insect that is to appear from it. It should be noticed that if one of these flies is laid hold of, it executes such contortions that some persons are alarmed and speedily let it go. *Boreus hyemalis* is a

rather scarce insect with us, and one of the few that come forth in the winter. Though the legs are long, the form of the head shows its connection with the *Panorpidæ*; and on the back the wings are gathered into a kind of bunch, which Mr. Wood compares to the hump with which the traditional Mr. Punch is adorned. The female has the wings almost suppressed, and both are not much beyond the size of a good-sized aphid.

The Snake Flies (*Raphidii*) form another section of the Neuropterous insects. The designation, both in Latin and English, arising from the length of the prothorax, which forms

FIG. 167.—METAMORPHOSES OF THE SCORPION FLY (*PANORPA COMMUNIS*).
(Engraving lent by Messrs. Cassell & Co.)

a peculiar neck, supporting a head also peculiar in shape. These flies are most common near ponds and rivulets, though from their preying on winged insects, they occasionally visit gardens when flowers are abundant, and attract flies by their honied stores. A female *Raphidius* has an ovipositor formed of two blades, its use being different from that with which the genus *Panorpa* is furnished, as the eggs of the *Raphidii* are thrust under the bark of trees. The larvæ of the Snake Flies present the same singularity as do the imagoes, according to Professor Westwood; and they are serpent-like in action as well as appearance, on the same authority, for he describes one as creeping slowly along, giving to the body violent jerking motions from side to side. We may assume that it moves thus in order to seize its prey, since in habit it is as carnivorous as the fly. It is probable that Figuiér is in error in representing the pupæ as active, a statement, indeed, which is almost contradicted by his own figure. Staveley asserts that though at first torpid, when near the end of its pupation a Snake Fly begins to move about. In neither of these stages are the insects

easy to discover. The flies attract notice, however, in the spring, ere the host of the Diptera are on the wing.

At this time of the year those who are busy in horticultural pursuits, either in or out of doors, are sure to come across individuals belonging to the family of the Myriapods or Centipedes, which, though now by naturalists separated from the true insects, are so commonly associated with them in popular phrase that they may claim a passing mention. Reputed to be hostile to the garden, they are not all deserving of this bad character. Everyone is doubtless at times a vegetable feeder; but the species belonging to the "Hundred Legs" section of the Myriapods are also destroyers of insects, some even that are larger than themselves. The "Thousand Legs," on the contrary, do mischief without any alleviation. In both divisions the names are not to be taken literally, it must be remembered, for the *Julidæ*, common types of the "Thousand Legs" have about three hundred feet, and if we count the legs of a *Scelopendra*, by no means could we make out anything approaching the hundred. In all these species the insect com-

mences life with a moderate number of legs, and grows more by degrees as it increases in size and strength. The Centipedes proper, Scolopendra, are undoubtedly good hunters; the head, which is horny and shield-like, has beneath a pair of formidable jaws, which cut sideways. Under the microscope we detect a slit near the extremity of each edge, from which it is presumed a poisonous liquid is instilled into the wound. The legs of a Centipede allow of rapid locomotion, and they are covered with such tough scales that a considerable amount of pressure does little harm. We are too apt to imagine that when we discover a Centipede on some plant it has visited the plant to do mischief, whereas it is often merely intent upon the slaughter of other species. Sir John Lubbock has given an interesting account of several small Myriapods of the genus *Paucopus* observed by him to be racing about rapidly amongst dead leaves; and of one named *P. Huxleyi* he states that is a "bustling, active, neat, and cleanly little creature," which seems a curious collocation of adjectives, and it has also "a look of cheerful intelligence, which forms a great contrast to the dull stupidity of the Julide, or the melancholy ferocity of most Chilopods." These Centipedes have one long alimentary canal, therein resembling Lepidopterous larvæ. They pass through no regular transformations.—J. R. S. C.

LAPAGERIA ROSEA.

I HAVE a very large *Lapageria rosea* growing on a north wall inside the conservatory, which has flowered most magnificently

Fig. 108.—*LAPAGERIA ROSEA*.

this summer, and I have no doubt it will continue flowering till next May. I enclose you a few flowers to show you the size they grow to. No plant is more easily grown. We have had an immense quantity of seed from the plant this year. It has been fifteen years growing, and was one of the first plants imported; and from the earlier plants the flowers are much more brilliant and larger than the later-imported ones. I believe it to be the largest plant in the north of England.—L. HAMMER, *Deanwater, Wiltshire*.

"We never saw more brilliant-coloured or larger flowers. In one cluster of six flowers they were 3½ inches long, and nearly the same across their mouths. We know it must be a most ornamental climber, and judging from the leaves and portion of branch sent to us, it must be most vigorous. Not as doing justice to the specimen sent, but to show its mode of growth to those of our readers who may not know the plant, we add this wood engraving (fig. 108).—EDS."

NOTES ON VILLA AND SUBURBAN GARDENING.

Window Plants.—If it were possible to single out any part of plant-growing as being more popular than another in large towns, I should say it is that of growing plants in windows. It is in reality plant-growing by the million, for who is there that has any fondness for plants at all that does not attempt something of the kind? Happily this increasing love for plants among the population has been recognised by the Government so far as London is concerned, and thousands of surplus bedding plants are annually distributed to persons who would not otherwise have the means of procuring them. I need scarcely say that I consider this a step in the direction towards making many towns more comfortable, because they will be more sociable and neighbourly as the love for plants increases. Now I presume that there are yet many people who would devote more of their spare time to window-gardening if they knew what plants there

are that would thrive in such positions; I therefore purpose naming a few of those most common and easily-procurable things. First, there is the *Calla aethiopica*, or Ethiopian Lily, a plant that throws up several stems with broad dark green leaves at this season of the year, and produces large white flowers in the spring of the year—a most admirable plant for a window in any position. Next are some of the *Cannas*, which are used in the flower garden. These are plants with handsome leaves of a large size, and, if taken up and potted carefully, will produce their bloom later on and then die down, when the roots may be preserved like Dahlias in some cool dry place till spring, and then again planted out. These plants, like the *Callas*, are increased by division. *Solanums* of the *Capsicastrum* type, such as were mentioned some time ago, must not be forgotten, as the profusion of bright-coloured berries makes them excellent decorative plants for windows. The different sorts of *Chrysanthemums*, too, are all decorative plants for windows for some time to come; and if any are growing in the garden, now is the time to take them up and pot into common garden soil, and if watered carefully will flower remarkably well by this treatment. After flowering they may be turned out of doors again, as they are all hardy. The old *Hydrangea hortensis* is an excellent window plant both for foliage and bloom, and one of the most lasting when in flower. Associated with the above tall-growing plants must be the *Myrtle*, a rare old favourite, and a plant that will thrive with ordinary attention. Other plants that may be mentioned as suitable for the window in winter, and which may be arranged in front of the tall plants, are *Geraniums*, *Cinerarias*, *Primulas*, and *Calceolarias*, with *Hyacinths* in pots or glasses, *Tulips* and *Crocuses* intermixed with them; and for suspending from the top of the window a good plant

will be found in any of the Ivy-leaved *Geraniums*, *Ferns*, and *Saxifrages*.

Now let me devote a little space to the treatment of window plants. First as to *potting*. A plant should never be put into a dirty pot. If the pot have been used before it should be thoroughly washed, and be quite dry when used; if not, the soil adheres to its sides, and when the plant has to be turned out for repotting the ball is sure to be broken, and of course the roots of the plant injured. The soil, too, should be used in a medium state of dryness. If too wet it becomes hard and crusty and almost air-tight, consequently no plant will thrive long in it. *Potting* and *pruning* ought not to be performed at the same time. Deciduous plants, such as the *Fuchsia* for instance, ought not to be potted till they have made a start into growth; consequently it is best to do the pruning first and allow the buds to just break into growth, and then the roots are in a fit state to take hold of the fresh soil. Every pot should be carefully and liberally drained, and the drainage covered with moss or rough material to prevent the soil from washing into it and stopping the outlet of the water. In *watering* window plants the greatest care is necessary, especially during winter; for to deluge the roots with water as some do is pretty sure to terminate fatally. Enough water should be given to penetrate the soil thoroughly, and no more. The plan of standing the pots in pans or saucers is not a good one: it prevents the free drainage of the water from the roots, and in time turns the soil sour, and the plant falls into bad health and dies. When watered, the plants should be taken to a place where the water can drain away, if there is no convenience for that in the window. On the other hand, plants must not be kept too short of water when growing freely; for if the soil be too dry, and the roots cannot obtain enough moisture from it, the plant suffers that way. When a plant^{is} requires water it should be watered well; and as some plant^{are} require more water than others, the difference should be made up by watering these plants oftener, and not make a practice of watering every plant at regular periods whether they want it or not.

Give window plants plenty of light and air now, and do not

crowd the window too much, as it is much more pleasing to grow a few plants well than to have so many for the sake of variety and do none well.—THOMAS RECORD.

DOINGS OF THE LAST AND PRESENT WEEKS.

KITCHEN GARDEN.

REMOVING the stalks from the *Asparagus* beds, after cutting them over close to the surface of the ground. They are carried away carefully, so that the seeds do not fall on the ground, where they are a considerable nuisance, as they vegetate freely during the ensuing summer. The treatment of the beds here is another characteristic of our soil and climate. Most persons are aware of the usual method of growing *Asparagus*. The most common is to plant in beds from 4 feet wide, and to allow only about a foot distance between each plant. An alley 18 inches wide is allowed between the beds, and from this the mould is thrown out on to the beds until the alleys are a foot or more deep, as we have seen them this year. Our method is to keep the beds level or nearly so throughout. This year we will give a good dressing of rich manure over the surface of the quarter, and, as there will be plenty of spare soil, a dressing of this over it. The plants are 18 inches apart, and the rows 2 feet. In our dry soil deep alleys dry the ground too much.

Planting-out *Lettuces*. These and *Cauliflowers* were sown with the autumn Onions. Better plants of each are obtained in this way than by sowing in small beds, where the plants are frequently crowded together; and if they are not planted-out as soon as they are ready, they become weakly from overcrowding. Being distributed thinly amongst the Onions they do not suffer in this respect. We used to grow the Brown Cos for winter, as it is thought to be the hardest; but we have never failed with the Paris White, and now grow the best type of it, Hick's Hardy White, exclusively. If the ground had been ready for the Cauliflower plants they also would be put out. For the earliest crop the sooner the plants are out after the middle of October the better. A second sowing should be put in early in the same month to succeed them. A large quantity of *Gladiolus* is grown in the kitchen garden, and as the ground is made rich for them, it answers for Cauliflowers without manure; merely digging the ground over, a little fine dry loam is put on the place where the hand-lights are to stand in which to plant-out the young plants.

Red Cabbages are also planted-out at this time. They are sown also in the first or second week in September. This is early enough in the neighbourhood of London; in the north and all cold districts it is better to sow two weeks earlier. We saw a specimen of a Red Cabbage grown in the south from seeds sown about the middle of August; and instead of one large compact heart as firm as a cannon ball, the plant had broken into about a dozen small loose heads, and the entire crop was the same. The seeds were blamed for this, but there could be no doubt that the seeds were sown too early, which induced a tendency to run to seed.

Potatoes are being lifted and stored. The crop is good and free from disease. This is not the case in Scotland. In some districts from one-third to a half of the entire crop is bad; and the autumn rains having set in, there is little chance of getting what is good stored in good condition.

Removing the decaying leaves and weeds from *Sau-kale* beds. This allows the sun and air to get at the crowns; and by stirring the surface the maturation of the plants is effected, and they are thus in better condition for early forcing.

FRUIT AND FORCING HOUSES.

Pines.—The fruiting plants are all in a house by themselves, and can be treated to a drier atmosphere. The temperature is lower than in the houses where the plants are growing or maturing for forcing early in the following season. We have tried various methods to keep the fruit of *Pines* after it is ripe, and have found none to answer so well as cutting the fruit before it is quite ripe, and then placing them in a box in the fruit-room that is not quite air-tight, but very nearly so. Here they will keep longer than they will if the plants are allowed to remain in the house, or even if the whole plant is removed to a cooler house. The crowns of Smooth-leaved *Cayennes* may be saved as the fruit is used, and potted in small pots, using a lighter compost. As it is now late in the season, plunge the pots in a brisk bottom heat, and do not water for a week at least after potting. Those intending to grow *Pines*, and who require to keep-up a supply for the winter months, should grow the above-named sort almost exclusively. Black Jamaica may be better flavoured, and Charlotte Rothschild may sometimes produce larger fruit, but for general good qualities the Smooth-leaved *Cayenne* is better than both sorts together. We do not maintain so much as atmospheric moisture now; all that is required is to damp the interiors and walls of the houses twice a day in warm dry weather, and once only in dull weather. The evaporating-troughs are not supplied with water after this time.

Peach Houses.—It may be as well to repeat the caution about keeping the inside borders sufficiently moist. There is not much

danger of too much wet if the drainage is good, but much injury results from overdryness. If it is intended to have the fruit ripe about the end of May the trees will be bare of leaves, so that any pruning required may be done at once. The instructions given during the growing season have been to thin-out all wood not required for fruiting. The trees must now be loosened down from the trellis, and the young wood be tied up in bundles to be out of the way when the glass, woodwork, and wires are being washed. The trees should also be washed with soapy water, using a sponge. No injury will befall the buds if the shoots are washed the right way—not against the buds. Brown scale is prevalent in some places; it is easily destroyed by washing it off with the sponge. The inside border is treated in the same way as that recommended for Vines last week.

We are often asked what are the best varieties of *Pesches* and *Nectarines* for forcing. Not more than three or four of each are required, which makes the selection very difficult indeed. Of *Pesches* Early Rivers, Early York, Royal George, and Barrington will give a good succession. Of *Nectarines* we would name as the best four Hunt's Tawny (Rivers's Lord Napier may be preferable, but it has not been sufficiently proved), *Violette Hâtive*, Pine Apple, and Victoria.

GREENHOUSE AND CONSERVATORY.

The *Tacsonia Van-Volcemi* is a beautiful object at this season of the year planted out in the conservatory border, and trained high overhead so that the flowering growths hang down for many feet. *Lapageria rosea* and *L. alba* are now surpassingly beautiful. What a glorious sight is the long corridor at the Messrs. Veitch's nursery, King's Road, Chelsea, canopied with both varieties intermingled! From one end to the other the snow-white and rosy-crimson bells are studded thickly, and beautiful as stars in the Milky Way. Our own plants are also loaded with flowers. The stronger the young growths thrown up from the base of the plant are, the larger will be the clusters of flowers. If a very strong growth is stopped at, say, 9 or 12 feet, flowers will be formed at the axils of the leaves for about 2 feet down the stem.

Mildew had appeared on some of the hardwooded plants, and the weather is very favourable at present for its rapid development. Dusting with flowers of sulphur stopped its progress.

It is always best to pot *Liliums* as soon as the stalks die down. This was not done at that time, so that the early and late-flowering varieties have been potted at the same time. In cases where the pots are large, and a number of roots are grown in one pot, the roots are separated from each other, and nearly all the mould is shaken from the roots; the largest bulbs are then planted in the centre of the pot, placing smaller roots round the sides. A number of roots are also potted singly in 5 and 6-inch pots; these are very often more useful than larger plants for working-in amongst other plants. The bulbs that were grown in such small pots last season will not be disturbed much now. The surface mould and all the roots that came from the base of the flower stem are removed and the plant repotted, this time in 7 or 8-inch pots. The best potting material is turfy loam four parts, leaf mould one part, rotted manure one part, with some sand added to the compost. Some persons add turfy peat, but it is not necessary to do so.

Acacias are now shedding their leaves. It is necessary to shake the plants occasionally and to sweep them up to keep the places tidy. Thinning the buds on the *Camellias*. With care in watering the plants and ventilating the house none of them will drop after this time, and the plants have usually three times as many as they will bring to perfection.

FLOWER GARDEN.

The slight frost early in the month cut down the *Colceus Verschaffeltii*. Nothing else was killed by it, but the dashing rains and wind have finished-up nearly all the beds for the season.

Lifted the *Gladiolus* roots. Although the spikes were not so strong as usual, and the roots, as a consequence, of this are not so large, they are very sound and well ripened, and the beds contained fewer failures than usual. Some extensive growers complain of many blanks in their beds, but in nearly every instance it will be found that overgrowing the plants is the reason. Manure water applied in quantities may and does cause a very strong growth, but it is at the expense of the ultimate health of the roots. The roots in every case are cut from the stalks at once and spread out in a dry place; when convenient they are cleaned and stored away in papers for the winter.—J. DOUGLAS.

TO CORRESPONDENTS.

* * All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

BOOKS (B. T. J.).—We do not know the book you name. Thompson's is as useful now as when first published. (J. H.).—The best is Vere Foster's "Preliminary Drawing Book," published by Marcus Ward, Chandos Street.

SECRETARIES OF HORTICULTURAL SOCIETIES (W. M. P.).—We know of no rule binding secretaries to send copies of schedules to applicants, nor should they be asked to do so unless the cost of postage accompanied the application.

MONTHLY TENANT (J. P.).—You cannot legally remove the shrubs and other plants you have planted unless your landlord permits.

TREATMENT OF ROSES IN POTS (H. T.).—The treatment you propose, if well carried out, will insure success. The plants are more liable to be attacked by green fly than red spider. If you want good flowers in winter it will be necessary to place the pots in the forcing house or pit. Syringe the plants daily, and if green fly appear fumigate with tobacco. You also mention "resting" and "hardening-off." Now a Rose tree is never at rest, unless the temperature is near or under the freezing point, so that the roots must not be dried up. In winter not much water is required. When the flowers are about to open remove the plants from the forcing house to the greenhouse, and after flowering still keep them under glass if the weather is unfavourable. Do not place the pots out of doors until May.

TRANSPLANTING TEA ROSES (G. W. J.).—Next month we should remove them from the stiff clay soil and plant them in the lighter loam. The planting would be safer performed now than in spring, but we should not move them until next month, for the wood, as they are flowering, will not be over-ripe, but they will be better off frost to stay their growth. They will need in their new quarters to have protection given the roots as well as the heads in severe weather, and nothing answers better than dry litter, bracken, or hay lightly disposed over the heads, removing it in mild weather.

TWELVE DAHLIAS FOR EXHIBITION (W. R. C.).—Arbitrator, Earl of Radnor, John Standish, Lesh, Lady Gladys Herbert, Mrs. Doring, Richard Heady, Ovid, Toison d'Or, Umpire, William Pringle, George Eliot, Lord Derby. There is little difference in the earliness of Dahlias. Plant early, and protect with branches of spruce for a few days.

ZONAL GERANIUMS FOR COOL HOUSE (S. P.).—Jean Sisley, scarlet; Warrior, ditto; Miss Rose Peach, rose; Madame Rundersdorff, salmon; Mrs. Rousby, clear salmon; Vesuvius, scarlet; Madame Vaucher, white; Leonidas, bright red.

PHLOX (Idem).—Emile Mezdard, Liervallii, Nightingale, Orphée, Rigolette, Souvenir des Terres, Virgo Marie.

PENTSTEMONS (Idem).—Conquest, Flambeau, George Sand, John Blaikie, Minstrel, Robert Rutherford, Thomas Brier, William Sutherland. These are all good sorts, but you should apply to any of the eminent florists who advertise in our columns, and ask them to supply your wants.

LEeks FOR EDGING (Echeveria).—We never heard of their being so employed. You must mean *House-leeks*. They can be had of the principal florists who advertise in our columns.

REPLANTING LAPAGERIA ROSEA (An Old Subscriber, Dublin).—The north or shady side of the house is more suitable than the south or "sunniest side," and we should at once transplant it to the former, moving carefully, and taking care to provide for it abundant drainage and rough fibrous peat soil with very fibrous loam, two parts of the former to one of the latter. When the plant is growing freely water abundantly. The shoots not elongating after they have advanced to 4 or 5 inches may be the result of dryness at the roots, accompanied with a dry atmosphere. There will be less danger of the plant suffering from dryness on the shady side of the house. From the present time to January is a good season to remove the plant.

LAYERING CLEMATIS (F. J.).—You may now layer any shoots of this class of plants, making an incision at or just below a joint, and about halfway through the shoot, layering in the soil and securing with a peg. It will not be until this time twelve months that the shoot so layered may be detached from the parent plant. Firm young shoots are best.

CONCRETE BENEATH VINE BORDER (J. D.).—A layer of stones, brickbats, shells, or clinkers, 6 inches deep, to form a dry bottom; a layer of chalk or lime in the proportion of 1 to 10 of the stones or other foundation, and well rammed to the thickness of 3 inches; over this half an inch of gravel and lime, or fine chalk; water and ram well again.

VINES FOR GREENHOUSE (Rev. George S.).—If you have not Vines, it is likely you would have climbers, and the one is not more injurious than the other; in fact, Vines are not so injurious as climbers, from the fact of their being less in winter. Either may be injurious or useful, just as they are planted so closely as to cover the roof with foliage and cause too much shade for the growth of plants beneath, or at a good distance apart so as to only partially cover the roof, and so afford in summer an agreeable shade. If you have no other house for Grapes we should advise them, but not planted more closely than 4 feet apart, which will give you six Vines, they being planted along the front, the two end Vines 2 feet from each end. Had your greenhouse front wall been on arches we should have planted them inside, and had the border partly within and partly outside the house. Without the wall on arches we should plant the Vines outside, and introduce them through a hole for each in the brickwork, unless you will have holes made in the wall 2 feet wide, leaving a 14-inch pillar between, and putting in an arch over the 2-feet space to support the sill, which the centre of the arch may be just under; and in that case we should plant inside at 9 inches or a foot from the front wall, training the canes 15 inches or 16 inches from the glass, and up the roof. We should have two Black Hamburg, two Buckland Sweetwater, one Trentham Black, and one Foster's White Seedling.

GRAPES MILDEWING (M. J.).—As the Vines and Grapes mildew every year, there is something radically wrong either with the border or the ventilation of the house. Is the bor. ever well drained? See to it, and if water lodge remove it by drainage without delay. If the house is ill-ventilated have the ventilation put right before another season. It is not mature the border requires, mildew chiefly showing itself on Vines growing in soil which is too moist and rich. A top-dressing of equal proportions of turfy loam and half-decayed stable manure would be good, putting it on about 3 inches thick and incorporating it with the soil of the border to a depth that does not interfere

with the roots. You may also add a bushel per square rod of half-inch bones, mixing with the surface soil. When the Vines are pruned strip the rods, &c. of the loose bark, and dress them with a composition of soft soap, 1 lb. to a gallon of tobacco juice, which may be had of any druggist, and add sulphur vivum sufficient to bring it to the consistency of paint or cream. With this composition dress every part of the Vines, brushing it well into every angle and crevice, and taking care not to rub-out the Vine eyes. Keep a strict watch next season for the appearance of the mildew, and upon its first appearance dust the affected parts with flowers of sulphur, and repeat the application as may be necessary, admitting air freely. We trust you will have better success another year.

GRAPES VARYING IN SIZE (A. B. P.).—Not knowing any of the circumstances we can only express, as our opinion, that deficient root-action and insufficient thinning of the bunches occasion the defect. The only merit of the Gros Colman is the large size of the berries. Their want of colour may arise from defective root-action. In each case a better supply of moisture to the roots, and a little weak liquid manure, would be remedial.

PEARS (J. F.).—Soldat Laboureur is the same as Beurré d'Arenberg. Olivier de Serres is a good very late Pear. All the others are of no account on this side of the Channel. You will find them all described in the new edition of the "Fruit Manual," which will appear in the course of a few weeks.

COPING FOR PEACH WALL (F. L. G. C.).—At the under side of the stone or other coping it would be well to arrange for a protective coping for the trees in spring. A coping of 11 inches in width is good; or two 1-inch flooring-boards 7 inches wide, tongued and grooved; and in joining them together, if you brush hot pitch into the groove and upon the tongue you will have a rainproof joint. Across the boards, at every 3 or 4 feet, you will need to nail a cross piece $\frac{1}{2}$ inches wide to keep the boards from warping. Instead of two 7-inch you may have two 9-inch boards joined together; and you will have a 14-inch or 18-inch wooden temporary coping, just as you employ the different width of boards. To support the wooden coping you will require iron brackets. We have found none so handy as the following:—Fig. 109 is

Fig. 109.

an illustration of it. Fix to the face of the wall pieces of iron $\frac{1}{2}$ inch by half an inch, and 13 inches in length, with a square hole at the top $\frac{1}{2}$ inch by three-quarters of an inch, and another of half an inch, 9 inches from the top hole, with two holes for bolts to drive into the wall. The plate will on the face have the appearance of A, fig. 109. The plate should be let into the under side of the coping up to the top of the upper square hole, and before driving-in the bolts a space an inch longer and the same size in other respects as the upper hole must be cut out of the face of the wall $\frac{1}{2}$ inch deep, opposite to where the plate is to be fixed. The distance apart ought not to exceed 6 feet. Wrought iron is the most suitable material, and the plates should be well secured by the bolts. These plates are to remain permanently fixed in the wall. The brackets are of cast iron, and though they are not different in pattern from those for shelves, instead of screw-holes they have at the top a lug $\frac{1}{2}$ inch long one way, and $\frac{1}{2}$ inch the other, and a stud at the bottom which fits the lower square hole in the plate. The use of the lugs will be seen on reference to B. To fix them, all we have to do is to put the top lug through the top hole in the plate and let it drop; it will hang by the lug, and cannot by any possibility fall out, and the bottom lug drops into the lower square hole in the plate. The coping boards are then put on, and will fit exactly beneath the coping, and having an incline outwards, the water will drop clear of the trees. A screw will keep the boards from being dislodged, a hole being at the end of the bracket that is within an inch of the end. The coping boards should have a coat of boiling oil tar when dry, or of black varnish, and will last many years, they being put on when the first blossom opens, and they may remain on permanently up to June. They may then be removed, be replaced when the fruit commences to ripen, and be left on until the leaves fall, taken off again then, and remain off until the blossom is expanding in spring. In addition to the coping boards you will require a canvas or other screen to protect the blossom, young fruit, and tender foliage in spring from frost. It may be fixed to the outer edge of the coping boards, or made to move backwards and forwards by having an iron rod and rings, taking care to secure it against winds.

GARDEN FRAMES (A. C. K.).—A one-light frame may be about 4½ feet in width from back to front, and 3 feet 6 inches the other way; 15 or 18 inches high in the back, and 9 in front, with a glass sash or light, made to fit the top completely, to slide up and down and move away occasionally. A two-light frame may be 7 feet long, 4½ wide, and 15 or 18 inches high in the back, with bars reaching from it at top to the front, serving both to strengthen the frame and help to support the lights; the two lights to be each 3 feet 6 inches wide, made to fit the top of the frame exactly. A three-light frame should be 10 feet 6 inches long, 4½ wide, and from 18 inches to 2 feet high in the back, and from 9 to 12 or 15 inches in front, observing that those designed principally for the culture of Melons may be rather deeper than for Cucumbers, because they generally require a greater depth of mould or earth on the beds, though frames 18 or 20 inches in the back, and from 9 to 12 in front, are often made to serve occasionally both for Cucumbers and Melons. Each frame should have two cross bars, ranging from the top of the back to that of the front, at 3 feet 6 inches distance, to strengthen the frame and support the lights; and the three lights should be each 3 feet 6 inches wide, the

whole together being made to fit the top of the frame exactly every way in length and width. The other subjects you mention will be duly noticed.

GLASS FOR ROOF OF INTERMEDIATE PLANT HOUSE (H.).—Hartley's patent rough plate glass, which we presume is the same as "rolled sheet," will answer admirably for the roof, and will lessen the necessity for shading; in fact, enable you for flowering plants to dispense with it.

GAS STOVES (T. S. C.).—We believe that for small glazed structures gas-heating is as economical as any other mode, and for an amateur by far the least troublesome. Write to the makers who advertise in our columns, and tell them what you need.

HEATING BY GAS (Subscriber).—We heated a small conservatory by means of a copper boiler fixed away from the conservatory and a 3-inch iron flow and return pipe, the flow proceeding from the top of the boiler, and the return joining the boiler near its bottom. Anyone who manufactured such apparatus should be able to erect it. See a letter in another column; it is written by a gentleman's gardener.

CULTURE OF FRENCH MELONS (C. D.).—French Melons only differ from the kinds grown in this country in being larger and inferior in flavour. The kind you have, the "Rock," is a very large, very ugly, and very inferior Melon, and has been in cultivation in this country more than a century. You will succeed with them in frames or pits heated by fermenting materials, for culture in which instructions have been frequently given in this Journal from time to time. The best Melon for an amateur is Little Heath, which has a hardy constitution, and may be grown in a frame with very little aid from artificial heat. It is also of good size. Superior kinds for flavour are Read's Scarlet-fleshed and Meredith's Cashmere, but they require heat.

SOIL FOR FOREST TREES AND SHRUBS (H.).—The digging has well prepared for planting, and we should not apply manure of any kind until the spring. Give a top-dressing of the dissolved bones when growth commences.

CUCUMBERS (C. S.).—We cannot insert high testimonials from anonymous correspondents.

PLANE TREE (R. E. H.).—This tree ought to succeed on the outskirts of Liverpool in such a situation as you name.

WALNUTS (S. C.).—The unallured proverb that a Walnut tree is one of the three examples of the benefit of thrashing, is, like the other two, erroneous. Walnuts are best allowed to remain on the tree until they fall when the branches are shaken. If your trees have declined in vigour, spread some manure on the surface 2 or 3 feet from the stem, and keep the surface mulched throughout the summer.

CONVERTING MELON HOUSE INTO VINERY (J. G. B.).—Your house will be suitable for Vines, and need not be altered in any way. The sides and ends being of glass would in no wise assist the Grapes in colouring, the house being well ventilated at the roof. The border should be at the low side of the house, and if you could arrange to have the Vines planted inside, with the front wall of the house on arches, so as to admit the roots to pass from the inside to the outside border, all the better. If you could make but a 3-foot border inside it would be better than having them in an outside border and the Vines introduced through a hole in the wall. Keep the border well above ground so as to have it well drained. The pipes will probably interfere with your having an inside border; if not, by all means have it, and plant the Vines 1 foot from the wall, training the Vines 15 or 16 inches from the glass. You will be able to accommodate six Vines planted 3 feet 3 inches apart, planting 18 inches from each end. The kinds we advise are three Black Hamburgs, two Buckland Sweetwater, and one Foster's Seedling.

GRAFTING HOLLIES (Ignorant).—This is not the time of year to graft Hollies. March and April is the proper time, working them outside by the usual process of whip or tongue-grafting and near the ground, so that after claying them they may have earth placed against them, leaving only the leaves of the graft bare. It is not necessary to operate upon them under glass. If the season be a forward one, the last fortnight of March, or if a late one the early part of April, noting when they are swelling their buds, and then grafting before they have advanced. The grafts must be shoots of the last summer's growth, the stiff ones preferably to the thin and weak. Any failures may be made good by budding in July.

FOLIAGE TO ACCOMPANY FLOWERS (A. B.).—There is often considerable difficulty in procuring green material for flowers in spring, as the young green growths of most plants are too tender for the purpose, so soon fading or shrivelling in a cut state out of water. We have found few things more enduring than the common kinds of hardy Ferns, as Polypodium vulgare, Polystichum aculeatum, Blechnum Spicatum, and the common Lady Fern (Atyrium Filix-femina), and Lastrea dilatata, and such others of the free-growing kinds grown in heat until full-sized, and then placed in a cooler house to harden are admirable. The beautiful Adiantum assimile placed in a warm house in February or earlier, and when a good growth has been made, the fronds full-sized placed in a greenhouse to harden. A. cuneatum similarly treated is even better. Spirea japonica leaves are also good, as is also Lily of the Valley leaves; whilst for fine cut foliage what is there to equal the Carrot? Pot a number of roots with their crowns just above the surface, keeping only moist until growing freely, and when the leaves are as large as you wish, remove to a cool house.

MALVA CAPITATA.—"E. T. H." wishes to know where he can obtain seeds of this species.

FUNGUS ON PEAR LEAVES (A. B. E. D.).—The Fungus is Rostelia cancellata. You should at once burn all the infected leaves, or your Pear trees will suffer. If too late this year, pick all the bud leaves next year as soon as they show symptoms of the disease, and on no account let them remain under the trees.—M. J. B.

FRUIT (S. M. W.).—We have no more specimens to name. The Aromatic Russet and Pine Apple Russet are distinct varieties. The Hollandbury Apple is useful from November to January. Brown Bourne Pear is usually ripe this month. Medlars are fit for gathering when they part easily from the spray.

SPIRÆA (W. H.).—It is certainly not a Spiræa, but we cannot identify it from a leaf.

MARIE LOUISE PEAR (G. A. B. Louth).—After the leaves are off make a solution of Gishurst compound in the proportion of 8 ozs. to the gallon of water, and wash the tree. Do this again in the spring, and you will get rid of the mussel scale with which the tree is infested.

OPENINGS FOR ROOTS IN FRONT WALL OF PEACH HOUSE (A. H. Lemon).—Your gardener is quite right. The top of the opening should be 6 inches below the surface of the ground; the reason for this being, that if the roots find their way out there they will be more likely to remain near the

surface of the border outside. At the same time we do not think it necessary to alter the arches, as it would incur considerable expense without a corresponding advantage being gained by it. If the space in the wall is filled with loam, and the under surface of the border is as low or lower than the under part of the opening, the depth of 18 inches would be no bar to the roots finding their way outside in quantity.

PRICE FOR FOWLS' DUNG (E. B. T.).—We are quite unable to say what is the value of fowl manure. We should think it very cheap at £5 the ton. We have tried it with flowers, especially Roses, mixed with an equal weight of earth. The result was most satisfactory. We tried it for Oats. It produced straw more than 7 feet high, and as large as a lady's little finger. We manured for Wheat with it this year on light land, and the drought caused it to be a failure.

NIGHT SOIL FOR FLOWER BEDS AND LAWNS (J. W. B.).—As it is thoroughly decomposed, by which we presume it is old, if mixed with an equal quantity of soil, it may be applied as a dressing to the flower beds an inch thick, mixing it thoroughly with the soil of the beds to a depth of 9 inches or a foot. For the lawn it should be thoroughly mixed with six times its bulk of soil, and laid in a heap, turning it over at least once during the winter in dry frosty weather, and be applied to the lawn in February or early in March, giving a coating all over about a quarter of an inch deep if the growth of the grass is very poor, or only half the thickness, or an eighth of an inch, if not very poor. We should give the lawn a thorough scratching with an iron rake if it is mossy, before applying the compost, and early in April again rake it, and if thin of grass sow over it 8 lbs. White Clover, 4 lbs. Suckling Clover, 8 lbs. Crested Dog's-tail Grass (Cynosurus cristatus), and 4 lbs. each Hard Fescue (Festuca duriuscula), and Evergreen Meadow Grass (Poa nemoralis sempervirens), in mixture for one acre. Roll well afterwards, and you will have a fine lawn.

INSECTS (James Bow).—The black insects on the Spruce Fir tree are the Aphid Laricis commonly found on the Larch. If possible, it would be advisable to sweep off the insects from the single tree attacked to prevent them spreading to other trees.—I. O. W.

NAMES OF FRUITS (Subscriber).—Pears: 1, Thompson's; 2, Nouveau Poiteau; 3, Jersey Gratioli. Apples: 4, Scarlet Pearmain; 5, Autumn Pearmain; 6, Alfriston. (Boston Sp.)—1, Brown Bourne; 2, Bergamotte Calotte; 3, Paraisse d'Autonne; 4, Bourne d'Aremberg. (J. B.)—1, Duc d'Anjou; 2, Red Doyenne; 4, Bourne Superfine. (J. W. K.)—It was impossible to distinguish your Dauson, for it was completely smashed in coming through the post. (H. P.)—1, Jersey Gratioli; 2, Urbaniste; 3, Louise Bonne of Jersey; 5, Aston Town; 6, Belle de Noël. (A. F. E.)—1, Comte de Lamy; 2, Louise Bonne of Jersey; 3, Hacon's Incomparable; 4, Bourne Del; 5, Bourne de Capinmont; 6, Hampden's Bergamot. The Apple is not known. (L. J. B.)—1, Doyenne du Comice; 2, Lewis's Incomparable; 3, St. Michel d'Archange. (E. M.)—1, Seckle; 2, Orange Mandarin; 3, Comte de Lamy. (G. McG.)—1, Winter Quoining; 2, not known; 3, Robinson's Pippin. (E. L. Highgate)—1, Cambridge Pippin; 2, Northern Greening; 3 is very much like No. 2. (H. Swift)—Apples: 2, Duck's Bill; 3, Hall Door; 4, Winter Greening; 5, Beauty of Kent; 6, Golden Noble; 7, Court of Wick; 10, Fearo's Pippin; 11, Lord's Pearmain. Pears: 1, Bourne de France; 2, Bourne Del. (R. R. Garneth)—Apples: 1, Hutton Square; 2, Winter Greening; 3, King of the Pippins. Pears: 1, King Edward's; 2, Vicar of Winkfield.

NAMES OF PLANTS (W. B.).—6, Oneidum Wraye or O. bifolium. The Begonias were too withered, and the Conifer unnameable from the scraps sent; 1 may be Abies alba. (Annie).—1, Cornella Emerus; 2, Lobelia polyphylla? specimen very bad; 3, Chelone glabra. (W. B. P.)—1 and 4, Both Begonias, but we cannot determine the species. Ferns next week. (A. F. E.)—Cytisastera Poblana, Nes (Justicia carnea, Ldl.). (J. B.).—Alnus glutinosa lacinata, or Jagged-leaved Alder. (B. K.).—Poa annua.

POULTRY, BEE, AND PIGEON CHRONICLE.

THE POULTRY-KEEPER.—No. 24.

CUCKOO COCHIN-CHINA.

No variety is more curious really than this. It is marked uniformly like the Guldrea, and it is doubtless the issue of the Buff Cochinchina, or the Black or White, but more often of the Black.

The cocks are generally of two distinct plumages, one with grey Cuckoo feathers, and with hackle, shoulders, and lance-shaped feathers of a good straw colour, with spots the whole length of the feather. The other is entirely grey Cuckoo. If these last are not the richest they are certainly the purest. Referring to the Bredas, Guldrea, or Breda Cuckoo, the feathers will be found to resemble those which form the ground of the Guldrea plumage, and identically the same as that which forms the plumage of the Cuckoo Cochinchina cock and hen.

The marking of the feather is the same over the entire hen, neat and scale-formed. It is the same with the cocks, except that the feathers of the hackle, the shoulders, and the lance-shaped feathers are entirely speckled, and that in the large and small sickles the marks are in number and size in proportion to the length of the feathers.

GENERAL CONSIDERATIONS OF COCHIN-CHINAS.

The first birds I saw in France were those brought in by Admiral Cecil, and came really from Cochinchina, and do not at all resemble those we now know, which have more weight, are slightly different in form, and which came from Shanghai, the place probably where they originally were obtained. They have been crossed afterwards with bad analogous varieties. Nothing is more erroneous than the opinion as to their delicacy of temperament, or the difficulty of making them reproduce, or the impossibility of their getting acclimatised. With regard to the care the early chickens require brought-up in cold or rainy weather, it is no more than is required by the chickens of all

other varieties, except that the Cochins require more at the time of moulting the down; and to cramp, to which several other varieties are subject, and which is generally caused by the damp and cold in a yard badly kept-up, or by a run miry in winter. With the exception of these two cases, for which a remedy can be obtained, there does not exist an indigenous race of which the birds are so adapted for the homestead, or which resist better the different causes that interfere with their growth. If it has been wished to raise a great number of chickens in a confined space, which is soon infected, the breeders have not failed to attribute the failures to original delicacy what should be attributed to the ignorance of the raiser. I firmly maintain that all good breeders will agree that after the Brahma, which is nothing really but a variety of the Shanghai, this is the most hardy, and that by crossing it imparts to our delicate species a great part of its hardiness.

The Cochins are not as fierce and as great a fighter as many others, yet it is not the less a brave combatant, especially if one of those newly imported. The hen even, which looks so gentle, fights with fury all new comers. The variety is very sedentary, does not plunder nor devastate gardens, and a very low barrier protects these sufficiently. A cock is good for reproduction when he has not any known maladies till four, or five, and six years old, and the hen is very productive till three or four years old. When the cock has reached the weight of 9½ lbs. the first year, the hens that of 6½ lbs. the first year and are of a perfect form, they have the merit making them preferable to other varieties, and that is the rapid increase in weight joined always to an excellent form, but to judge of the real value of weight it must be what they acquire the first year.

BRIGHTON POULTRY SHOW.

This annual Show was held at Brighton on the 17th, 19th, and 20th inst., being moved from Lewes, where it was held last year. We should think and hope the funds of the Society were enriched by this move, for Brighton is just now so full of visitors, and the Poultry Show made a pleasant change when the Pier, and the Aquarium, and the Pavilion, and all the Brighton sights had been done. We believe the Show being held at Brighton brought many exhibitors themselves as well as their birds, many seizing on the opportunity of seeing the Aquarium, not one, maybe, recognising for a minute any stone of that fairy-like abode of the fishes as belonging formerly to one of London's great bridges. The Show was held in the Corn Exchange—a room well adapted for an exhibition. It held all the 907 pens comfortably, and would hold another three or four hundred more. The arrangements were capital, Mr. Billett being there with all his staff, and the pens were in two tiers, and showed the birds off well. The room was brilliantly light, and in the evening the gas department was well attended to. The birds were fed on Spratt's food, and good wheat and barley. We hope the Show has paid well. Last year we fear Mr. Lenny dropped a lot of money over the Show. He certainly is a most hospitable Secretary, for he gave a most *recherché* spread, and asked most of the exhibitors. Among the company we noticed the Mayor of Brighton, Rev. G. Hodson, Hon. H. Sugden, Rev. C. C. Ewbank, Mr. Tegetmeier, Mr. Percivall, Mr. J. Martin, Mr. S. Fielding, Capt. Coleridge, Mr. Willmore, Mr. Billett, Mr. Woodgate, representatives of most of the Sussex press, &c. After luncheon several toasts were proposed and speeches followed after, when all adjourned to the Exhibition, and we commenced to criticise the Dorkings, which came first in the catalogue.

There were eleven pens of *Dorkings* in one class of any colour. The quality was very fair, but we have seen better birds at these southern shows. The first were nice chickens, but they would not bear much better company. Second was the pen, or one of the birds was, we think, which won at Tunbridge Wells; they were a nice-coloured pair. Third also good. Highly commended (Turnour) a good pair of chickens.

Brahmas, Dark, came sixteen pens strong. We did not think them as a class so good as the last few shows we have attended. The cup for the first three classes went to Creeting. They were a nice pen, and looked capitally. Second, nice pair of chickens. Third were a very young pair. There was another pen or two we liked almost as well, still it was a promising pair. Pen 21 (Leno) was empty. Highly commended (Harvey) a well-pencilled pullet. *Brahmas*, Light, were a strong class, thirty pens or more. The first were closely pressed by second. Had the pullet in latter pen a better comb we should have given them first, though the first cockerel was more matured rather than the second. Third also a good pullet. Highly commended (Pitt) 48, a young but most promising pullet with an unusually nice cockerel.

Cochins, Buff, only four entries! Surely it would be worth anyone's while to take this variety up if only for the southern shows. Nice Buff chickens first, good Cinnamons second, and rather a poor pair of Buffs third, which were, however, soon claimed for a couple of sovereigns. *Cochins*, Any other variety, a good class. Whites won first, the cockerel a large bird and

well developed, with a good White pullet. Second, grand *Partridges*, the pullet exquisitely pencilled, and the cockerel a good shape and deep black. They were rather small, their only fault. Third also good chickens, well pencilled and feathered. Highly commended (Warde) very young but good Whites.

Game were good classes. First smart Reds, well shown. Third a nice cockerel. In the next class a good Duckwing cockerel won with a nicely-coloured pullet. Second and third good Piles.

Hamburgs were two good classes. In Pencilled the Duke of Sutherland won with a good pair of Silvers, the cockerel especially good. Second good coloured birds, and the third was a smart pen. Highly commended (Maynard) a good cockerel; the pullet's pencilling not quite distinct enough. In the Spangled class the Duke got the cup, and it was well won. The cockerel was a picture, his comb A1, and not showing the trace of steel. His spangling was very fine also. We thought this pen cheap to an exhibitor of this variety at £12 12s. Second and third good birds, and of fine quality, with not much to choose between them.

Spanish a good class; the first chickens the best we have seen this season so far; we shall expect to hear they were claimed at catalogue price, £10 10s. Second also promising, and third too, but the latter were young by the others.

Polish a capital lot. First and second wonderful markings and crests; third good, but we liked pen 123, highly commended (Adkins), as well almost. We were sorry to see Mr. Hinton's Malays in his Polish pen, and his Polands in the Malay pen. We tried hard to find the baskets to see if we could trace how the mistake arose, but were unsuccessful.

French a beautiful class. Mr. Dring's Houdan chickens, which were first, were good in colour and size; second good Houdans; and third a fine pair of Crève chickens; highly commended (Greenhill) also good Crève chickens.

The Variety class was one of those medleys we detest—every conceivable variety. The Judges cannot hope to please all here. It is next to impossible in a good class to weigh one variety's merits against another's; but, like the brook, we suppose these classes will go on for ever—certainly as long as committees are so shortsighted as not to divide-up classes more. Black Hamburgs won first and second. If we could take one bird from each pen we could make a rattling pair. Third Malays, large and brilliant in colour. Good Sultans, Silkies, &c., were highly commended.

Game Bantams were good. The first Reds, good in style and colour; and in the next class Duckwings and Piles won the prizes.

In the Bantam Variety class Gold Sebrights were first, a trifle large, but nicely laced; second good coloured Blacks; third small White-booted; highly commended (Gedney) good coloured Cuckoos.

The Sussex class was not so good as we saw last year at Lewes. Dorkings, Dark and Light Brahmas, won in the order named.

The Sale classes were large, and many birds changed hands.

Ducks were good classes. We never like to see Rouens and Aylesburys in one class. The first and third prizes went to good pens of the latter, heavy Rouens taking second. In the Variety class brilliant Blacks first; fancy Ducks second and third; highly commended (Kelleway) good Blacks.

Mr. John Martin judged all the poultry, and his awards gave most general satisfaction. We never heard less grumbling, even among the disappointed ones. Mr. Percivall judged the Pigeons, and he must have had a difficult job. The quality was unusually good. We liked one or two Carriers and Antwerps better than the winners, but in other classes the right birds seemed to win. There was a point cup which was won by Mr. Vander Meersch. We give full awards below.

DORKINGS—*Chickens*.—1, G. Ellis, Betchworth, Reigate. 2, H. Humphrey, Ashington. 3, Rev. H. F. Hamilton, Chard. *he*, Viscount Turnour, Petworth; Rev. E. Burham, Berkhamstead; R. Cheesman, Westwell, Ashted.

BRAHMAS—*Dark—Chickens*.—1 and Cup, H. Lingwood, Creeting, Needham Market. 2, P. Ogilvie, Hambledon. 3, J. Long, Bromley Common. *he*, W. W. Lyne, Shoreham; J. Harvey, jun., Thringington, Canterbury.

Light—Chickens.—1, H. Lingwood. 2, M. Leno, Markvate Street, Dunstable. 3, T. A. Dean, Marden. *he*, H. Stead, Tunbridge Wells; H. Treacher, Oatlands; S. Pitt, Ore, Hastings; G. & H. Smith, Bath; C. Woolgar, Bramber; C. E. Horsfall, Liverpool; J. Long; S. Pitt; H. M. Maynard, Ryde, Isle of Wight; W. Pearce, West Horsley.

COCHINS—*Cinnamon or Buff—Chickens*.—1, C. H. Matthews, Locks. 2, J. L. Nash, Spongthorn, Ipswich. 3, F. Ogilvie. *Any other variety—Chickens*.—1, R. S. Woodgate, Pembury, Tunbridge Wells. 2, Capt. F. G. Coleridge, Twyford. 3, C. H. Matthews. *he*, Mrs. E. Fryor, Welwyn; Rev. A. W. Waide, Uckfield; R. S. Woodgate. *c*, J. A. Sleep, London.

GAME—*Black and other Reds—Chickens*.—1, H. E. Martin, Fakenham. 2, G. Bentley, Rickmansworth. 3, W. W. Pyne. *he*, J. H. Levett, Brighton; E. Wilkinson, Manchester; W. Foster, Deal. *Any other variety—Chickens*.—1 and Cup, J. W. Fitch, Romford. 2, W. Foster. 3, H. Ritchie, Tunbridge Wells. *he*, G. H. Fitzherbert, Sevenoaks.

HAMBURG—*Pencilled—Chickens*.—1, Duke of Sutherland, Stoke-on-Trent. 2, T. & W. Pawcett, Baldon. 3, Mrs. J. M. Rolla, Monmouth. *he*, J. Long; H. M. Maynard; E. T. Foakes, Tunbridge Wells; Miss M. Bryant, London. **Spangled—Chickens**.—1 and Cup, Duke of Sutherland. 2, Mrs. J. M. Rolla. 3, J. Long. *c*, J. Carr, Swansea.

SPANISH—Chickens.—1, T. Boulter, Clerkenwell. 2, H. Brown, Putney Heath. 3, H. Wilkinson, Ebury. *he*, J. Gliddon, Bristol. *c*, A. Bentley, Rickmansworth; F. H. Le Suer, Jersey.

POLISH—Chickens.—1, 2, and *he*, G. C. Adkins, Lightwoods, Birmingham. 3, T. Dean, Keighley. *c*, J. Marles, Brighton.

FRENCH—Chickens.—1 and *c*, W. Dring, Faversham. 2, J. W. Moyle, Becken-

ham. 3, Rev. C. C. Ewhank, Biggleswade, hc, B. D. Greenhill, Panton; G. W. Hibbert, Godley, Hyde.

ANY OTHER VARIETY EXCEPT BANTAMS.—*Chickens*.—1, Duke of Sutherland, 2, J. Long, 3, S. Elliott, jun., Liskeard, hc, F. Harding, Walthamstow; Rev. A. G. Brooke, Shrewsbury; Miss M. E. Croad, Durrington; J. P. Poyer, Hastings; R. S. S. Woodgate; H. Feast, Swansea; A. Kitchen, Dunsdale.

GAME BANTAMS.—*Black and other Reds*.—*Chickens*.—1, T. W. Anna, Clapham, 2, R. B. Smith, Townsend, 3, V. Sandford, Norwood, hc, J. Long; C. W. Gedney, Bromley, c, W. Bontcher, Notting Hill (2); Rev. E. J. Tideman, Brentwood. *Any other variety*.—*Chickens*.—1, R. Brownlie, 2, J. Long, 3, C. W. Gedney.

BANTAMS.—*Chickens*.—1 and Cup, M. Leno, 2, R. H. Ashton, Mottram, 3, R. S. S. Woodgate, hc, J. Longe, Ipswich; C. W. Gedney, c, H. Feast.

SUSSEX CLASS.—*Chickens*.—1, Viscount Tournour, 2, W. Greenfield, Worthing, 3, W. E. Edgill, Frant.

ANY VARIETY.—*Cock or Cock*.—1, M. Leno, 2, T. W. Fawcett, 3, J. Marles, 4, T. J. Sattmarsh, Chelmsford, hc, P. Ogilvie (2); J. H. Pickles, Birkdale; J. Bradshaw, Cranleigh; Duke of Sutherland; P. Luck, Eastbourne; Rev. C. C. Ewhank; J. P. Poyer, c, P. Ogilvie, *Pair of Hens or Pullets*.—1, H. Ritchie, 2 and 4, P. Ogilvie, 3, A. W. Warde, hc, H. Humphries; Rev. J. D. Peake, Chertsey; C. Howell, Ramsey; P. Luck, c, Viscount Tournour; H. Humphries; Rev. T. Cochran, Romford; E. A. Durrant, Ragnaer, Lewes; H. Treacher, c, J. Sattmarsh, hc, T. de Le Sprye, Newton St. Lo; Miss M. Bryant, *Cock and Hen or Chickens*.—1 and Cup, J. H. E. Ivimey, Elmfield, 2, Rev. T. de Le Sprye, 3, Rev. G. L. Farthing, Tottenham, 4, Capt. R. R. Warren, Warfield, hc, Rev. T. Cochran; W. Pine; H. Treacher; P. Ogilvie; Mrs. Wilde, Uckfield; C. Bloodworth, Cheltenham; Duke of Sutherland; T. & W. Fawcett; W. Dring; E. Haywood, Uckfield; V. Sandford, Norwood; C. Howell, c, J. K. Lawther, Tunbridge Wells; W. M. Ward, Brighton; K. A. Belsier, Fenchurst; C. Howell.

DUCKS.—*Forced or Ashbury*.—*Drake or Duck*.—1 and 3, N. Edgill, 2, Duke of Sutherland, hc, J. Harvey, jun.; P. Ogilvie; E. Haywood; F. Warde. *Any other variety*.—1, G. J. Sainsbury, 2, M. Leno, 3, R. Wilkinson, hc, J. W. Kelleway, Isle of Wight; E. Haywood; R. J. Stratfield, Uckfield (2); M. Leno, c, J. W. Kelleway.

PIGEONS.

CARRIERS.—*Cock*.—1, H. Yardley, Birmingham, 2, J. C. Ord, London, 3, W. G. Hammock, Iford, rhc, J. C. Ord, hc, J. Ford, London; W. J. Nichols, London; E. Walker, Leicester. *Hen*.—1, J. H. Ivimey, 2, E. Walker, 3, W. G. Hammock, rhc, H. M. Maynard; R. Cant, London; W. G. Hammock, hc, H. M. Maynard.

CARRIERS.—*Young*.—*Cock or Hen*.—1, W. Massey, Spalding, 2, E. Walker, 3, R. Cant, rhc, J. C. Ord; J. H. Ivimey, Ellisfield, Kington, hc, H. M. Maynard; J. H. Ivimey.

POUTERS.—*Cock or Hen*.—1, 2, and 3, A. A. Vander Meersch, Tooting, rhc, Rev. C. C. Ewhank.

TUMBLERS.—*Cock or Hen*.—1 and 2, W. G. Hammock, 3, H. Yardley, rhc, J. Ford; R. Cant.

BAKES.—*Cock or Hen*.—1, A. A. Vander Meersch, 2, E. Walker, 3, H. M. Maynard, hc, A. A. Vander Meersch; H. M. Maynard (2); W. Massey, hc, A. A. Vander Meersch.

DAKONS.—*Cock or Hen*.—1, 2, and 3, E. Graham, South Birkenhead, rhc, A. A. Vander Meersch; W. Smith, Walton-on-the-Hill; J. Philpott, Clapham; G. Hardy, Shepherd's Bush; A. A. Vander Meersch.

JACOBIANS.—*Cock or Hen*.—1 and 2, A. A. Vander Meersch, 3, G. Hardy, rhc, A. A. Vander Meersch.

FANTAILS.—*Cock or Hen*.—1 and 3, A. A. Vander Meersch, 2, H. M. Maynard, rhc, H. M. Vella, Homerton; J. F. Loversidge, Newark; J. Walker, Newark-on-Trent; A. A. Vander Meersch.

ANTWERPS.—*Short-faced*.—*Cock or Hen*.—1, A. A. Vander Meersch, 2, A. Farndon, Hinchley, 3, W. S. Marsh, Deal, hc, W. S. Marsh; H. Yardley; C. F. Copeman, Solihull.

ANTWERPS.—*Working*.—*Cock or Hen*.—1, W. S. Marsh, 2, A. Bentley, 3, J. J. Sparrow, London, hc, E. F. Wilson, Brighton; J. J. Sparrow; C. L. Sutherland, Colombe; Col. C. F. Hassard, Sheerness.

ANTWERPS.—*Working*.—*Cock or Hen*.—1 and 2, G. J. Lenny, Lewes, 3, E. F. Wilson, hc, E. F. Wilson, Brighton; W. English, Hayward's Heath; G. J. Lenny (2).

ANY OTHER VARIETY.—*Cock or Hen*.—1 and 3, A. A. Vander Meersch, 2, G. Hardy, hc, G. Hardy; R. Wilkinson; G. Holloway, Stroud.

ANY VARIETY.—*Cock or Hen*.—1, J. Ford, 2, H. M. Maynard, 3, J. H. Ivimey, hc, A. Bentley; C. Ward, Lewes; J. Ford.

ANY VARIETY.—*Cock or Hen*.—1, H. M. Maynard, 2, Rev. A. G. Brooke, 3, A. A. Vander Meersch, hc, J. Ford; G. T. F. Pointer, Wood Green (2); E. Durrant, Tunbridge Wells.

CATS.

TABBY OR TABBY AND WHITE.—*Short-haired*.—1, J. Ward, Brighton, 2, Mrs. H. C. Organ, Teidington, Extra 2, G. Ellis, London, 3, Mrs. Thewell, hc, L. Pickett, Brighton; E. Baxter, London; Miss Sidney, Brighton; S. Samway, Southampton.

TORTOISESHELL OR TORTOISESHELL AND WHITE.—*Short-haired*.—1, J. Harvey, 2, J. Strotton, Streatham, 3, P. Luck.

ANY OTHER COLOUR.—*Short-haired*.—1, Mrs. Shackward, 2, Mrs. S. Barnes, Croydon, 3, M. A. Wellmar, hc, S. Samway, c, G. H. Fitzherbert; J. Braden, West Croydon.

ANY VARIETY OR COLOUR.—*Long-haired*.—1, F. J. Goodall, Hanley, 2, — Melison, Brighton, 3, Mrs. Halsey, Blackheath, rhc, Mrs. Lawless, Brighton; Miss A. Garbanati, Highgate Rise; Mrs. H. C. Organ.

LITTER OF KITTENS.—1, Mrs. H. C. Organ, 2, T. Bryce, Havant, 3, J. Poocek, Great Berkhamstead.

CAGE BIRDS.

NORWICH.—*Clear Yellow*.—1, J. Adams, Coventry, 2, J. Garrett, Brighton, 3, E. Orme, Derby, rhc, J. Adams; S. Tomes, Northampton; G. J. Barnesby, Derby; E. Orme; E. W. Lulham, Brighton, hc, J. Garrett; G. J. Barnesby; E. W. Lulham.

NORWICH.—*Clear Buff*.—1 and 3, J. Adams, 2, E. W. Lulham, rhc, G. J. Barnesby (2); S. Tomes; E. Orme; E. W. Lulham, c, J. M. Fellingham, Brighton (2).

NORWICH.—*Any other variety*.—1, J. Adams, 2, G. J. Barnesby, 3, E. W. Lulham, rhc, R. J. Pope, Brighton; J. Adams (2); E. Orme; E. W. Lulham (2). hc, J. Garrett; S. Tomes; G. J. Barnesby; J. M. Fellingham (2); c, J. M. Fellingham (2).

BLON—1 and hc, V. Sandford, Norwood. 2, 3, and rhc, C. D. Carver, Landport.

LIZARD.—1, E. W. Lulham.

MULE.—1, J. Adams, 2 and c, E. W. Lulham, 3, J. Stapleton, jun., Brighton, rhc, J. M. Bowley, Brighton, hc, J. M. Bowley (3); E. W. Lulham.

LINNET OR FINCH.—1 and 3, J. H. Verrall, Lewes, 2 and rhc, E. W. Lulham, hc, R. Sandell, London (2), c, H. Rovington, Frant.

BRITISH BIRDS.—*Any other variety*.—1, O. A. Watts, Brixton, London, 2, R. Sandell, 3, W. H. Smith, rhc, O. A. Watts; E. W. Lulham; J. Pratt, Paddington, Lond; n, F. Warde.

FOREIGN BIRDS.—*Any variety*.—1, W. Joslin, 2 and rhc, E. Sweeting, Sydenham, 3 and c, R. Sandell.

SELLING CLASS.—1 and 2, E. W. Lulham, 3, J. Adams, rhc, J. Tomes; G. J. Barnesby; E. W. Lulham; J. M. Fellingham; J. L. Mosden, Minories, London, hc, G. J. Barnesby; J. M. Bowley; V. Sandford, c, J. M. Fellingham (2); J. Garrett.

JUDGES.—*Poultry*: Mr. J. Martin. *Pigeons*: Mr. J. Percival. *Cats*: Mr. G. Billet. *Cage Birds*: Mr. A. Willmore.

MONMOUTH POULTRY SHOW.

ALL the arrangements at this Show were well carried out. The *Dorkings* good; a nice pen of Silver-Greys first. The first young Buff *Cochins* were good. Dark and Light *Brahmas* good; but some of the pens badly matched. *French* and *Polands* contained good birds. *Spanish*, first prize withheld, and the second and third-prize birds were not worth the carriage home. *Hamburghs* very good, as the names will show; but there should be a class for each variety. Silvers were first in each class, Golds second. The prize birds in the *Game* class were good; first Brown Reds; second Black Reds; third Piles. In the Any other variety class a grand pen of Black *Hamburghs* were first; to this pen also was awarded the extra prize for the best pen in the Show. *Bantams* were all in one class, and there were some grand birds of all varieties. The first prize went to a sweet little pen of Silver-laced; the second to a nice pen of yellow-legged Piles (the proper colour for the legs of Pile Game); the third to Black Reds, the cock in grand feather, but a little large. There was a nice pen of Blacks, but the hen was deformed.

Aylesbury Ducks good; but the second best pen was thrown out from having one leg marked. *Rouen Ducks* were creditable. Of Ducks, Any other variety, the first prize was given to White Calls; the second to Grey Calls. Mr. Sainsbury sent two pens of Black East Indian, but they arrived too late for competition. *Geese* were grand; and *Turkeys* also very good. In cross-bred fowls and Ducks Mr. Rolls swept the deck with birds of but little merit.

DORKINGS.—*Grey or Coloured*.—1, J. Robinson, Garstang, 2, J. McConnell, Ewas Harold, 3, H. Feast, Swansea.

COCHIN-CHINAS.—1, Mrs. E. Wilkinson, Manchester, 2, H. Feast, 3, R. W. Everett, Mitchellroy.

BRAHMAS.—*Dark*.—1, T. A. Dean, Malden, 2, H. Haddrell, Calne, 3, J. Robinson, Light, 1 and 2, T. A. Dean, 3, J. F. Hartland, Chesham.

SPANISH.—2, H. Feast, 3, J. McConnell.

FRENCH.—1, H. Feast, 2, G. W. Hibbert, Hyde, 3, Miss Mortimer, Rudhall, Ross.

POLANDS.—1, J. Robinson, 2, J. McConnell, 3, H. Feast.

HAMBURGHS.—*Gold or Silver-spangled*.—1, J. Robinson, 2, J. McConnell, 3, T. E. Jones, Wolverhampton. *Gold or Silver-pencilled*.—1 and 2, J. Robinson, Extra 1, J. McConnell, 3, A. F. Faulkner, Thrapstone.

GAME.—1, E. Woodward, Worcester, 2, E. Shaw, Oswestry, 3, H. P. Fowler, Price, Castle Madoc.

ANY OTHER DISTINCT BREED.—1 and Extra, J. Robinson, 2, J. Long, 3, N. J. Ridley, Newbury.

BANTAMS.—1, J. W. Lloyd, Kington, 2, F. Maitland, Worcester, 3, Wingfield and Andrews.

DUCKS.—*Aylesbury*.—1, Mrs. H. J. Bailey, Tenbury, 2, J. Robinson, 3, J. McConnell. *Rouen*.—1, Mrs. H. J. Bailey, 2 and 3, J. A. Lyne, Brynhyfryd. *Any other variety*.—1, Mrs. H. J. Bailey (Call), 2, J. McConnell (Fancy), 3, F. A. Barret, Walford (Black East Indian).

GESE.—1 and 2, Mrs. H. J. Bailey, 3, J. A. Rolls.

TURKEYS.—1, J. A. Lyne, 2, W. Lams, 3, J. A. Rolls.

CROSS-BRED FOWLS.—1 and 2, J. A. Rolls, 3, J. H. Hurd, Diogestow.

CROSS-BRED DUCKS.—2 and 3, J. A. Rolls.

BRADFORD PIGEON SHOW.

THE second Show projected and carried out by a few keen fanciers, at the head of whom were Messrs. Beldon and Hawley, was held in the Odd Fellows' Hall on the 14th and 15th inst. This was by far the largest Show ever held except at the Crystal Palace, there being close upon a thousand entries. Turner's pens were used, and placed three tiers high; for though the room was large and pretty well lighted, yet no room had to be lost to get all in, the consequence being that some were placed a little too high. The management was extremely good, a capital staff of feeders looking well to the wants of the birds.

Pouters were first on the list, and while Mr. Cannan judged these we thought we saw some of the old fever setting in, while first one and then another well-trained bird answered to the call, and certain it is we thought he would never have left them. Cocks, Black and Blue, had twenty entries, first and second going to Blue, and third to a Black, all very fine in shape, long in limb and feather, but the second-prize bird very shy. Hens, Blue and Black—the first Blue in splendid show, fine in limb and feather, but a little faulty in colour, or the cup would have gone here; second a showy Black, and third a Blue. Twelve entries. Cocks any other colour, a grand Yellow first and cup (Fulton); second, Mr. Bryce, Edinburgh; and third, Mr. Horner. Hens, first a splendid White, second Red, and third White.

In *Almonds* the prizes went more to head, beak, and eye than colour, the first and second being somewhat dark. In Any other Short-faces the first was a good Black Mottle, very quickly claimed at £3; second a Red Mottle; and third a Yellow Agate. Mr. Harvey's well known Dun Barb cock won the cup for this section, second Mr. Horner, and third Mr. Clay. And in the next class Mr. Clay was first, and Mr. Fulton second and third. Pen 151, Mr. Stanley's, contained a cock bird, and was disqualified at once; such conduct cannot be sufficiently condemned.

Carriers were good in all classes, though there were some birds left out on account of deformity or illness of one kind or other. In Black cocks the first outdistanced all the rest, although out of feather, the style and carriage, head and beak grand; second Mr. E. Horner with a good young bird; third, Mr. R. Fulton, also very good, most of the others receiving notice. In Any other colour Mr. Fulton showed a marvellous

Dun cock, which was awarded the oil painting for the section, Mr. Horner running very close with a grand Dun cock; third, Mr. Fulton, a younger bird. In Black hens Mr. Yardley won very easily with a grand bird, good in beak and eye-wattle, with capital neck and style.

In the next class Mr. Sefton had very easy win with a heavy-wattled Dun hen; Mr. Horner second; and Mr. Fulton third and very highly commended, the whole class being very good.

In foreign *Owls* first and cup went to a splendid White, second White, and third Blue. Eighteen entries.

Trumpeters very good, and when we say this we can convey no idea of the massive style of feather, size, rose, and feet.

In *Jacobins* Mr. Vander Meersch was very successful, winning two first and one second, the first with a nice Red, very small, although some preferred Mr. Fulton's unnoticed bird. Twenty-seven entries; a grand display.

In the next class a splendid White was first, Blacks being second and third.

Fantails were a grand lot, and the competition keen. First a most perfect bird, small, perfect tail, with high carriage and motion; the second and third-prize birds losing very little, even Mr. Liversedge having to be content with a highly commended.

Dragoons, Blue or Silver, were an immense class either as regards numbers or quality, there being thirty-three entries and seventeen noticed in the list. First a grand Blue, about as perfect as aught we have seen; second Blue, very good; and third Silver. The cup was given to the first-named in this class.

The first in the next class, a Yellow, was really good, the second being a grand Grizzle, a colour, by the way, which does not seem to be quite understood and appreciated; but this bird was the model of a good Dragoon; the third also a Yellow. Twenty-one entries.

Antwerps were a show in themselves, there being nearly ninety entries in four classes, and the competition keen, the cup being awarded to the most perfect specimen we have ever seen in the show pen, a Short-faced Silver Dun in the pink of condition; the second and third Red Chequers, also very good. In hens Mr. Gamon had an easy win with a grand Red Chequer hen, second a Dun, and third Red, many good birds being too long in face. In Long-faced cocks the first was very strong in head, not so good in colour; second better in colour, but not so well filled in head—both Red Chequers; third a good Blue Chequer. In hens a well-known Red Chequer stood first, and was sold at a long price; the second a good Dun; and third Red Chequers.

Next came English *Owls*, and these were a grand display, Mr. Binns being again to the front with a grand Blue cock, and winning the cup also. Forty-two entries, and the regret was that there were not more than three prizes to award.

Long-faced *Tumblers* were good in both classes.

Turbits, Red or Yellow, a marvellous class of thirty-eight birds, the prizes being well awarded. *Turbits*, any other colour, thirty-seven pens. First Black, second Silver, and third Blue, the losers being of such quality as will come to the front in smaller competition.

Nuns very good. A very grand Black hen first, many others of rare quality and marking.

Archangels were grand in colour, but a splendid Yellow Magpie won against these, securing the cup.

In *Swallows* the first was Red, second Black, and third Blue.

In any other variety the first-and-cup was a capital Pigmy Pouter, second a Blondinette, and third a Fairy, the class being very strong and good.

Next came the young classes, and a pretty puzzle they were. The *Pouters*, which contained thirty entries, was a grand display. First a White cock, a model of his kind, in grand show, 19½ by 6½ in limb; second Black, in fine order, 18½ by 7 in limb; third a Blue, not so good in girth or style, but 20 by 6½ in limb, many other birds being very fine, the cup going to the first-named bird. In young *Carriers* the first was a Black of great length of face, large, and stylish; second Dun, long and strong, but a little down-faced; and third a Black with very strong box beak and general good properties. Young *Barbs* moderate, while the young *Dragoons* were a very interesting class, the first-and-cup one of the most perfect Yellows ever seen in a show pen; the second and third Blues. Thirty-three entries. *Antwerps*, Short-faced, forty-six entries, some very promising birds, but many too long, some of which would have been as well in the next class, which was for Long or Medium-faced. In the Variety class the first was a very good Almond cock, second a Silver Owl, and third a Turbit, the class containing thirty entries. There were four Selling classes which contained upwards of a hundred entries, and there were many cheap and good lots which were quickly sold. Mr. Horner won the points' painting by a great number.

Mr. Cannan judged six of the sections, Mr. Hutton judged the remaining eight sections.

POUTERS (Black or Blue).—Cock.—Medal and *vic*, R. Fulton, London. 2, E. Beckwith, Sunderland. 3, E. Horner, Harewood. *hc*, R. W. Bryce, Loanhead, Edinburgh; W. Harvey, Sheffield. *c*, R. W. Bryce, E. Beckwith; F. Gresham, Cheshford; E. Horner. *Hen*.—Medal, W. Harvey. 2, E. Beckwith, 3, E. Horner.

hc, R. W. Bryce (2); J. E. Spence, Bronghty Ferry. *c*, E. Beckwith; F. Gresham.

POUTERS (Any other colour).—Cock.—Cup, R. Fulton. 2, R. W. Bryce. 3, E. Horner. *vic*, E. Beckwith; R. H. Blacklock, Sunderland. *hc*, E. Beckwith; R. Fulton. 2, Foster, Denholme Gate. *c*, R. Fulton, London; A. Wright, Leith. *Hen*.—Medal, R. Fulton. 2, E. Horner. 3, R. Fulton. *vic*, Mrs. Ladd, Caine. *hc*, G. Desner, Driffield; Major J. H. Cryer, Southampton. *c*, Mrs. Ladd; R. H. Blacklock; F. Gresham.

CARRIERS (Black).—Cock.—Medal, H. Yardley, Birmingham. 2, E. Horner. 3, R. Fulton. *vic*, J. Thompson, Bingley; W. Woolley, Hunbury; W. Minson, St. Ives; R. Fulton; P. R. Spencer, Hereford. *hc*, E. Beckwith; W. Sefton, Blackburn (2); E. Mawson, Moor Allerton; Miss F. Seaton, Leeds. *Hen*.—Medal, H. Yardley. 2 and 3, R. Fulton. *vic*, W. Woolley. *hc*, E. Horner (3); W. Minson. *c*, Major J. H. Cryer.

CARRIERS (Any other colour).—Cock.—Painting and 3, R. Fulton. 2, E. Horner. *hc*, W. Sefton; E. T. Dew, Weston-super-Mare; E. Horner. *Hen*.—Medal, W. Sefton. 2, R. Fulton. 3, E. Horner. *vic*, H. Yardley; R. Fulton. *hc*, Major J. H. Cryer; E. Horner.

TUMBLERS (Almond).—Cock or *Hen*.—Medal, E. Horner. 2, H. Yardley. 3, E. Beckwith. *hc*, E. Beckwith; J. Ford, London; E. Beckwith. *c*, H. Verdon, Wavertree; R. Fulton.

TUMBLERS (Short faced, any other variety).—Medal, J. H. Esden, London. 2, A. & W. Silvester, Sheffield. 3, R. Fulton. *hc*, E. Beckwith; J. Ford; H. Verdon; E. Horner (2).

BARS.—Cock.—Cup, W. Harvey, Sheffield. 3, E. Horner. 3, R. Clay, Manchester. *vic*, R. Fulton. *hc*, E. Mawson; R. Fulton. *Hen*.—Medal, R. Clay, Antenshaw. 2 and 3, R. Fulton. *c*, J. W. Townson, Bowdew; E. Horner.

OWLS (Foreign).—Cock or *Hen*.—Cup and *vic*, R. Clay. 2, T. W. Townson. 3, R. Fulton. *hc*, R. W. Bryce. *c*, W. Lumb, Rochdale; J. W. Townson; S. Dransfield.

OWLS (English).—Cock or *Hen*.—Cup, W. Binns. 2, R. Clay. 3, P. H. Jones, Fulham. *vic*, E. Lee, Nantwich. *hc*, W. Sefton; A. N. Dodds; R. Clay (5); J. W. Birtles, Birmingham; J. W. Townson, Bowdew; J. C. Ainsworth. *c*, Ward and Rhodes, Olney; H. Verdon, Wavertree; A. J. Barnes, Gloucester; R. White.

TRUMPETERS.—Medal, W. Harvey. 2, R. Fulton. 3, J. Lederer, Bootle. *hc*, A. A. Vander Meersch, London; E. Horner; R. Fulton. *c*, A. A. Vander Meersch; J. Lederer.

JACOBIANS (Red or Yellow).—Medal, A. A. Vander Meersch. 2, R. W. Bryce. 3, R. Woods, Mansfield. *hc*, J. Thompson, Bingley (2); T. Holt, Bradford; W. Croft, Killinghall. *c*, Rev. O. E. Cresswell, Bagshot; J. Richmond, R. Fulton. *vic*, Major J. H. Cryer and 2, A. A. Vander Meersch. 3, R. Fulton. *c*, E. Horner; A. Heath, Caloe; R. Fulton.

FANTAILS.—Medal, J. Walker, Newark-on-Trent. 2, H. C. Bowman, Higher Broughton, Manchester. 3, H. Simpson, Spalding. *hc*, H. Simpson; T. W. Ainsworth, Houghton Bank; J. Walker; J. F. Liversedge, Newark (3); E. Horner.

DRAGONS (Blue or Silver).—Cup, W. Sefton, Blackburn. 2, W. Markland, Deane, Bolton. 3, *vic*, W. Sefton. *hc*, W. Sefton (2); W. Lumb, Pinner; W. Smith, Watton, Liverpool; W. J. W. Fawcett, Manchester; S. Dronsfield. *hc*, W. Sefton; R. Woods, Mansfield; H. Yardley; R. Clay; W. Gamon, Chester (2); W. Smith. *c*, R. Clay.

DRAGONS (Any other colour).—Medal and 2, F. Graham, Birkenhead. 3, R. Woods. *vic*, F. Graham; W. Sefton. *hc*, R. Woods; R. W. Bryce; H. Bignell, London; J. Murray, Darham; S. A. Whyllie, East Moulsey; R. Fulton. *c*, W. Sefton; R. Woods.

ANTWERPS (Short-faced).—Cock.—Cup, R. Brierley, Fishpool. 2 and 3, W. Gamon. *vic*, J. Deakin, Sheffield. 3, J. Wright, Manchester; H. Yardley; J. Lister, Keighley; W. Gamon (2). *hc*, E. Coates, Burnley; A. Brook, Little Horton; W. Slater, Gravelly Hill; A. Bingham, Manchester. *c*, J. Wright. *Hen*.—Medal and *vic*, W. Gamon. 2, A. Brook, Little Horton. 3, J. Wright. *hc*, T. Jubb, Halifax; H. Gaugh, Wolverhampton; W. Slater; J. Rushworth, Keighley; J. Wright (2); J. Lister, Keighley; W. Gamon. *c*, T. Jubb.

ANTWERPS (Long-faced).—Cock.—Medal, W. Ellis, Jule. 2, J. Lister. 3, H. Jennings, Allerton. *vic*, C. Hopwood, Rochdale; A. N. Dodds, North Shields; H. Bignell, London; J. Murray, Darham; S. A. Whyllie, East Moulsey; R. Fulton. *c*, W. Sefton; R. Woods.

TUMBLERS (Long-faced, Mottles).—Medal, J. G. Orr, Beith. 2 and 3, D. Riddough, jun., Bradford. 3, W. & A. Silvester, Sheffield. *vic*, E. Horner, *hc*, J. Dye; J. G. Orr; E. Horner; W. B. Mapplebeck, jun., Birmingham; W. Harvey.

TUMBLERS (Long-faced, any other colour).—Medal, J. Dye, Hexham. 2, W. A. Hyde, Ashton-under-Lyne. 3, J. Watts. *hc*, T. Charley, Blackburn; A. Baird, Douglas; M. Green; D. Riddough, jun.; E. Horner; W. B. Mapplebeck. *c*, J. Dye; E. Ford.

TURBITS (Red or Yellow).—Medal and 2, W. Croft. 3, E. Horner. *hc*, A. A. Vander Meersch; Rev. O. E. Cresswell (2); T. S. Stephenson, Newbiggin, Beverley; E. Horner (2); H. G. Poole, Bradford; R. Fulton; W. Croft (4). *c*, R. Woods, Mansfield; H. Yardley; C. Anton, York; H. G. Poole, Bradford; J. E. Crofta, Worsop; T. Foster; W. Croft.

TURBITS (Any other colour).—Medal, Rev. O. E. Cresswell. 2, P. H. Jones, Fulham. 2, W. Croft. *hc*, W. Woods (3); P. H. Jones; W. Lumb, Rochdale; T. Foster; T. E. Dew, Weston-super-Mare; W. Croft (5). *c*, T. E. Dew.

NUNS.—Medal, W. Crofts. 2, H. Yardley. 3, E. Horner. *hc*, W. Crofts; J. Richmond.

MAGPIES.—Cup, Miss F. Seaton. 2, A. N. Bryce, Edinburgh. 3, M. Ord, Sedgefield. *hc*, P. H. Jones; H. Jennings; E. Horner (3); C. G. Hitchcock, Oxford. *c*, N. Hill, Edina, Ealing.

ARCHANGELS.—Cock or *Hen*.—Medal, H. W. Webb, Lower Sydenham. 2, J. Bowe, Herts Bay. 3, P. H. Jones. *hc*, R. Woods; E. Horner (2).

SWALLOWS.—Medal and 3, E. Horner. 2, T. Cropper, Bacup. *hc*, T. Foster; E. Horner; J. Watts.

ANY OTHER VARIETY.—Cock or *Hen*.—Painting, Miss F. Seaton. 2, H. Yardley. 3, W. Sefton, Blackburn. *vic*, H. W. Webb. *hc*, C. Anton, York; T. S. Price, Finchley (Silver and Blue Rued); J. Watts; J. E. Crofta; E. Horner; Miss F. Seaton; R. Fulton (Turbiten). *c*, G. E. Sawdon; A. & W. Silvester.

YOUNG BIRDS.

POUTERS.—Painting, Mrs. Ladd. 2, F. Gresham, Sheffield. 3, E. Horner. *vic*, Mrs. Ladd; J. Hairens, Hull. *hc*, E. Beckwith, Sunderland; R. H. Blacklock, Sunderland (2); N. Hill; W. Rutherford, Edinburgh; J. E. Spence; E. Horner; R. Fulton. *c*, T. Duncan, Dalkeith; G. Robinson, Sunderland.

CARRIERS.—Medal, W. Minson. 2, W. Bulmer, Spalding. 3, R. Fulton. *vic*, R. Fulton. *hc*, W. Sefton; Major J. H. Cryer (2); E. Horner (3); C. H. Clarke, Nottingham; P. R. Spencer. *c*, W. Bulmer.

BARS.—Medal, R. Fulton. 2, C. G. G. Gava, Spalding. 3, J. Lister. *hc*, J. Stanley, Blackburn; E. Horner. *c*, Major J. H. Cryer; J. Ashworth, Blackburn.

DRAGONS.—Cup, F. Graham, Birkenhead. 2, E. Horner. 3, R. Woods. *vic*, J. Stanley; R. Fulton. *hc*, T. Charnley, Blackburn; G. E. Sawdon; H. Jennings; W. Gamon; R. Brierley, Fishpool; W. Smith; R. W. Bryce; E. Horner. *c*, W. Sefton, Blackburn; N. Hill; J. Ashworth, Blackburn.

ANTWERPS (Short-faced).—Medal, J. Wright, Manchester. 2, J. Mitchell, Keighley. 3, W. Tomkinson, Burnham. *vic*, J. Barratow, Keighley; J. Mawson. *hc*, J. Smithers, Sheffield; W. Gamon; F. Woodhouse, Blackburn; R. Brierley; E. Coates, Burnley; E. Holdsworth, Wibsey; Jack; Tordoff and Wilkinson, Wibsey; W. Tomkinson. *c*, J. Stanley, Blackburn; J. Ashworth.

ANTWERPS (Any other variety).—Medal, H. Jennings. 2, T. Foster. 3, W. Markland, Deane. *vic*, W. Gamon. *hc*, H. Mitchell, Denholme, Bingley; A. C. Holloway, North Shields.

ANY OTHER VARIETY.—Cup, E. Horner. 2, Major J. H. Cryer. 3, M. S. Temple, Hexham. *vic*, G. E. Sawdon (English Owl); R. Clay (Foreign Owl); R. White; C. Duckworth, Wavertree, Liverpool. *hc*, N. Hill; R. Minnis, jun., Rochdale; R. Wilkison, Guldoford; E. Mawson, Allerton (Blue Owl); E.

Horner (2); R. Fulton (Owl). c. A. J. Barnea, Gloucester (Black Magpie); J. F. Loversidge; J. W. Towns, Bowden (Foreign Owl).

SELLING CLASSES.

PAIRS.—Price not to exceed £3.—Cup, E. Horner (Red Barbs). 2, J. Bailly, jun., London. 3, Rev. E. C. Ewbank, Biggleswade. *hc*, E. Beckwith, Sunderland. D. Kiddiough, jun.; E. Horner, Harewood (2); Miss F. Seanor. c. A. N. Bryce (Fantails); s. A. Whyllie.

SINGLES.—Price not to exceed £2.—Medal, W. Brydone (Barb). 2, R. W. Bryce (Mottled Trumpeter). 3, J. Bailly, jun. *hc*, W. Scotton; J. Lister; Mrs. Ladd (White Pouter). c. G. Cave, Spalding; J. Bailly, jun. (2); L. Allen; Southwark; E. Horner (White Pouter and Duo Barb); Miss F. Seanor. c. F. Graham; W. H. A. Miller, Walsall (Carrier).

PAIRS.—Price not to exceed £3.—Cup, E. Horner. 2, J. Lister; E. Horner (Black Pouters). 3, Rev. E. C. Ewbank; E. Horner. *hc*, W. Binos (Antwerp). *hc*, Wells & Sherrin, Ripon (Black Swallows); C. Auton; J. Lister; W. Brydone, Dunee; J. Watts.

SINGLES.—Price not to exceed £2.—Medal, Miss F. Seanor. 2, Mrs. H. Prickworth, Moulton Marsh. 3, T. Hornman, jun., Ripon (Carrier). *hc*, A. T. Umpleby, Boroughbridge. *hc*, Wells & Sherrin (Blue Carriers); J. Thompson; W. Brydone; T. Hornman, jun., Ripon (Carrier); J. Bailly (2); E. Horner. c. E. Beckwith; A. Smith, York; J. Bailly; G. F. Whitehouse, Birmingham (White Dragon).

JUDGES.—Mr. Cannan, Bradford, and Mr. E. Hutton, Pudsey.

CANARY SHOW AT THE ROYAL PAVILION, BRIGHTON.

This was the twenty-first annual Exhibition of British and foreign cage birds held in the King's Apartments in connection with the Brighton Amateur Canary Show. The past week has certainly been one of note to the "fancy" at Brighton, as much so as the present week at Brighton has been of consequence to the "fancy" in various parts of England, owing to the All England Show of poultry, birds, &c.; but our duty there is to chronicle the points made by the members of the Amicable Society. The birds exhibited were high enough in colour, and sufficiently good in quality and breed to fit the most fastidious fancy of a fancier. The specimens exhibited by Messrs. Pope, Peach, and Adams were really of a first-class stamp, and to the lot of Mr. R. J. Pope (of the eminent firm of Messrs. Pope & Son, of the New Road, Brighton), four silver cups were awarded, Mr. Peach also winning a couple of silver cups, besides numerous prizes to each exhibitor. The Exhibition opened on Tuesday the 13th, and was to continue open until Friday, but owing to the great success attending it, it was continued during the whole of Saturday. Thus there were two bird shows on at one time in the Royal Pavilion, the All England Show taking place in the Corn Exchange. The whole length of the King's Apartments, together with the anteroom, was fitted with rows of benches, the Canaries being placed upon the centre rows. The back part of the Apartments was given up to the exhibition of a fine collection of birds sent, not for competition, by Mr. Dench, of St. James's Street, who exhibited some fine specimens of Virginia Nightingales, Cut-throats, Zebra Finches, Parrots, Cockatoos, Bishop Birds, Piping Bullfinches, &c. The following are the awards:—

NORWICH.—Clear Yellow.—1, R. J. Pope. 2, C. Adams. 3, W. Peach. c. W. Braines. Clear Buff.—1, R. J. Pope. 2, W. Peach. 3, C. Adams. *hc*, W. Braines. c. W. H. Smith. Variegated Yellow.—1, R. J. Pope. 2, C. Adams. 3, P. Amore. Variegated Buff.—1, W. Peach. 2, C. Adams. 3, R. J. Pope. c. W. Braines. Tucked Yellow or Buff.—1, K. J. Pope. 2, C. Adams. 3, R. Peach. c. J. Mountney.

TENNESSEANS.—1, R. J. Pope. 2, C. Adams. 3, W. Peach. *hc*, W. Braines. c. H. Butler.

CINNAMON.—Yellow.—1, W. Peach. 2, R. J. Pope. 3, C. Adams. Buff.—1, R. J. Pope. 2, W. Peach. 3, C. Adams. Variegated.—1, R. J. Pope. 2, W. Peach. 3, C. Adams. *hc*, H. S. Smith.

GREEN.—1, C. Adams. 2, W. Peach.

BRIGHTON FANCY.—1, W. Peach. c. P. Amore.

NORWICH.—Cage of Six Young Clear Yellow.—1, R. J. Pope. 2, C. Adams. Cage of Six Young Clear Buff.—1, R. J. Pope. Cage of Six Young Variegated.—1, J. Heathorne. 2, K. J. Pope. Cage of Six Old Clear and Variegated.—1, Adams. 2, P. Amore.

CINNAMON.—Cage of Six Young.—1, R. J. Pope. 2, J. Heathorne. Cage of Six Young Variegated.—1, W. Peach.

ANY VARIETY.—Cage of Six Old Birds.—1, W. Peach. 2, R. J. Pope. 3, P. Amore.

GOLDFINCH MELE.—Fied.—1, D. Taylor. Plain.—1, D. Taylor. 2, W. Peach. Cage of Six.—1, W. Peach. 2, D. Taylor.

PARROT AND COCKATO.—LEISE.—1, R. J. Pope (Leadbeater). Extra 1 and 3, Mrs. Dench (Crimson Macaw and Rose Cockatoo). 2, Mrs. Bean (King Parrot). *hc*, Mrs. Bailey (Grey Parrot). c. B. Jones (Blue Macaw).

The Judges were Messrs. Wood and Beal.

SNELLS (HELMETS).

This variety has been admired by but few persons this side of the Atlantic. It belongs to the Toy class, and is, therefore, one of the easiest varieties to breed true. It was produced in the first place in that hothed of Toys, Germany, and ranks quite high in that country. And the only persons I have known to be great admirers of it have been Germans, who brought their tastes for plumage with them to this part of the world. It is a contemporary of the Nun and Spot, and evidently descends from the same forefathers; in fact, all the Toys are but modifications of colour upon the ordinary common Pigeon, and anyone familiar with markings can, in a few years, produce Breasters, Magpies, Swallows, Nuns, Snells, &c., at will. A Magpie, for instance, is but a Nun which has transferred the black from the wings to the back and breast; and a Swallow or Snell can be transmogrified into a Snell or Swallow.

Often in one's loft an oddly-marked Pigeon (a sport) will appear. If the marking is sufficiently curious it can be fixed in most cases by judicious selection and pairing of the young of that sport. There is such a tendency for any odd marking to become strong, that very little encouragement settles the question; therefore nothing is easier in the handling of Pigeons than to produce varieties of Toys. The Germans are continually doing this, and as continually allowing them to run out, for the reason that they do not become the fashion. I have seen in my life Nuns, Snells (with and without coloured flights), Spots, Breasters, Moorcaps, Death's Heads, &c., that were produced from the same strain of birds. How do you account for that? Why, just in the same way you have seen Turbits bred from Owls, or *vice versa*, where perhaps the first half dozen young will be various coloured Turbits, caps and all; and the next half dozen Owls, possibly all solid, and without the sign of a cap. The ancient Snell was a white bird with coloured head (scalp), flights, and tail; some were smooth heads, others capped, but when capped they were so like the Nun that it at last became the fashion to have them differ as much as possible, and the caps were prohibited, as were also the coloured flights. Now, therefore, the standard markings are as follows: A white bird with coloured scalp and tail. The line of colour on the head begins at the corner of the beak, passes backward through the centre of the eye, and around the head to the corner of beak opposite to starting point; the upper half of the beak is dark, the lower half white. The division of colour at the tail is a line drawn from the root of the outside tail feathers on each side, crossing the vent. The eyes are pearl, the feet clean; some few are capped or point-headed, but the most are plain-headed. One can in this variety have anything he wants; for instance, by a cross with Swallows a bird is produced with the coloured head, flights, tail, and feathered feet; by introducing a white bird Spots will be thrown in abundance, &c.

The Snell is called by many the Helmet, from the fancied resemblance to the covering of the head used by the ancient knights. One of the best exercises for a studious fancier, or for anyone who wishes to excel in the breeding of varieties, is to spend a few years experimenting with the selection and fixing of colour among Toys. It serves as an introduction to the study of the higher fancies, and it is absolutely needed for an appreciation of the Almonds, &c.

What amateur or tradesman of five, or even ten years, year, or twenty years, whose mission it has been to buy and sell birds, or to raise a few, can select a pair of short-faced birds, even out of his own loft, and say that they will breed Almonds? The reason of this is because everyone that buys a pair of Pigeons wants that pair to go down to hard work, laying eggs and nursing young ones, regardless of anything that may be learned, other than the price those young will bring.

Everything a man learns from personal experience becomes a key to something else he may come in contact with, and to nothing is this more applicable than in the Pigeon fancy. The fact of knowing that a cross between the Swallow and a Helmet will give the nucleus for a capped feather-footed Snell, is of itself knowledge invaluable. That this can be done anyone can prove by trying; and what are we here for but to observe, compare, and experiment?—Dr. W. P. Morgan, *Baltimore*.—(*American Fanciers' Journal*.)

In a late number there was an article on Snells, some parts of which are in my opinion incorrect.

That it, together with the Nun, was produced in Germany is not doubted; but that it was *not* produced (as the writer states it evidently was) from the same forefathers is apparent—the undegenerated Snell not being a Toy but a Tumbler bred to markings. Most fanciers, however, neglected every property except feather, hence the common Snell of to-day is nothing more than a Toy. Helmet Tumblers are yet seen occasionally. On the other hand a Nun bred to the highest standard is not, nor never was, else than a Toy. How, then, the same parentage?

The writer, Dr. W. P. Morgan, then states that "anyone familiar with markings can, in a few years, produce Breasters, Magpies, Swallows, Nuns, Snells, &c., at will" (the italics are not his but mine), and then proceeds to assure us that "a Magpie, for instance, is but a Nun which has transferred the black from the wings to the back and breast;" but allow me to ask whether he has ever *merely* transferred that black? I might here remark that a Magpie is also of Tumbler origin, and differs from a Nun, not only in colour but also in build. My reason for emphasising *at will* is this: the Germans produce new varieties of Toys by putting a number of hens of various breeds in a loft with male birds of other breeds, thus having no male and female of the same variety, and allow them to mate as their inclination tends.

As your correspondent says he has seen "Nuns, Snells (with and without coloured flights), Spots, Breasters, Moorcaps, Death's Heads, &c., that were produced from the same strain of birds," he will of course not object, *pro bono publico*, to give the foundation of that truly wonderful strain. What he gives as

an explanation (that it is "in the same manner as you have seen Turbits bred from Owls, caps and all, and *vice-versa*") does not satisfy me, at least, as breeding for colour is quite another matter to breeding caps and plain heads out of one pair; but Owls and Turbits differ in far more important points than as to caps, in fact there are plain-head Turbits, and a pair is, or was several months since, in this city.

In reference to the statement that "a Swallow or Snell can be transmogrified into a Snell or Swallow," I would ask how a Snell, which is a clean-legged bird, can be transformed into a heavy-booted bird vastly different in carriage, form, and markings?—W. ATLEE BURPEE.—(*American Fanciers' Journal*.)

[Doctors differ no doubt in America as in England, and, as we see above, someone differs from the doctor of American Pigeon fanciers—viz., Dr. Morgan. Dr. Morgan is quite right that the Helmet—that is, the original Helmet, is a contemporary of the Nun and the Spot. Moore, A.D. 1735, mentions the bird, and in his day it is clear that it was as thoroughly a Toy as either of the other birds, and nothing whatever of a Tumbler, as it was gravel-eyed; also, like the Nun, it was dovehouse-Pigeon-shaped and not Tumbler-shaped. The difference of any modern Helmet from the ancient one is that now the flight feathers are white and not dark, probably because now they (the Helmets) are further removed from the Nuns and more akin to the Tumblers; but I think the Helmet would be a better bird if it had the flight feathers dark.

Dr. Morgan has in his eye clearly the old Toy Helmet—the original Helmet; but, on the other hand, Mr. Burpee has in his eye the Helmet Tumbler, which Brent, long a resident in Germany, first as an English author mentions, and to which, half German by association as he was, he inclines. But I claim a higher English pedigree for the Toy Helmet, which was no Tumbler at all. Just as two doctors may differ and yet both be right, so of Dr. Morgan and Mr. Burpee. They refer to different birds, if I understand them rightly. I have called the birds all through Helmets, as the name "Snell" is unknown in England.

I have before noted that mere feather Pigeons find little favour in England, unless of very great beauty. German Toys are not much cared for, although the best part—the original part—of Brent's book is that in which he speaks of them; but though it has been published a dozen years or more, and has had a wide circulation, still German Toys are in few hands. I would, however, say that the breeding of our old English Toys ought to be kept up, and are the very birds for lady fanciers to take to, and in their hands would be certain, from their taste in colours, to improve. A pigeonry—an enclosed one—in which, for instance, were Nuns, Helmets, and Spots of various colours, would form a very pretty sight from their slight yet distinct shades of difference, and would be just the birds to interest ladies.—WILTSHIRE RECTOR.]

THE WASHING OF CAGE BIRDS FOR EXHIBITION.

THE exhibition season for cage birds is "on the wing," and for the particular information of those who have not hitherto tried their hands at the washing process, much useful instruction may be gleaned from a work published some years back, bearing the name of Mr. Barnesby, Derby, Judge of Birds. One-half the battle in bird-exhibiting is the staging of the birds in a clean condition, without which it cannot be expected that high honours can be gained. We give the following as his *modus operandi*:—"Many fine birds have been kept in the rear rank owing to the smoky or dirty state they have been in when exhibited. Whatever bloom they may be possessed of is partly hidden by the dirt and smoke; and were unclean birds encouraged before cleanly-looking specimens, an inducement would be offered to filth, and exhibitions would deteriorate. In performing the operation of washing much care must be exercised. You will require a cage for drying-in before the fire, with a soft cloth placed on the bottom inside the cage." [The use of a wire cage for drying-in is preferable to placing a washed bird upon a cloth upon the fender, as has been unwisely suggested, thus risking the chance of the bird darting from off the fender; and, even if it did not come in contact with the ashes beneath the grate, to a certainty it would not improve either the breast, wings, or tail during the time it was fluttering about.]

Mr. Barnesby further states, "A shaving brush (the one I use for the washing operation is of badger hair, being soft and easy), a fine soft drying cloth for extracting as much damp as possible out of the feathers before placing them in the drying cage, and two bowls for washing the birds in." [Two bowls will be quite sufficient.] "When you lay hold of a bird to wash it, handle it firmly but carefully. Hold the bird in the left hand with the head towards the wrist, the tail falling or resting along the forefinger. When washing, do not press the thumb tightly across the bird's neck, for by so doing the neck feathers may possibly

become frilled; then, after rubbing the brush upon the soap, apply it to the back of the bird, washing the back and wings down to the tail. Having freely operated in this manner turn the bird upon its back, and in a similar way clean the breast and underneath portion. Operate on the neck and head, and when you find the dirt well extracted rinse in clean warm water, or the feathers will not be in proper condition when the bird is dry. Do not be afraid of soap getting into the eyes or mouth, but of course be as careful as possible in this respect. The birds will during the washing become somewhat prostrate, and appear to an unpractised person as though they were dying, but it is not often such accidents happen."—A. FANCIER.

(To be continued.)

PROFITABLE BEE-KEEPING.

THERE can be no doubt that the object of bee-keeping is to get as much honey as possible. I say "the" object *par excellence*; there are doubtless many objects in bee-keeping. The naturalist and the lover of nature each has his object: the first in the scientific study of bees, to understand their habits and characteristics; the second in the great beauty and pleasure which belongs to these creatures, and their presence near the dwelling of man. The hum of the apiary in spring and summer has a special charm of its own, well appreciated by multitudes. But after all, honey is the *raison d'être* of bee-keeping. Granted, of course, for who will gainsay it, any more than that milk and butter are the object of the dairy farmer? How, then, shall we get the largest possible harvest from our apiaries? It appears to me that there is a ready answer to this question, which at no other period in the world's history could have been given. Our modern appliances are so perfect that a very little system introduced into the management of the apiary would produce in every case the maximum of profit with a minimum of loss.

Let me at once say that in future times high farming among bees should aim at the entire removal from all hives of every particle of honey which the insects have collected by the end of July or August, according to the season and the locality. What is easier with our bar-framed hives and honey-slingers than, after driving any given stock into some temporary hive, to place every comb within the latter-named instrument, extract the honey by a few turns of the handle, and when emptied (which can now be done, it seems, without injury to the brood) replace them, and when the emptied combs have been carefully re-adjusted, return the bees, and let them start fair again. Of course they will require to be fed, but with excellent sugar at 3d. per lb., or even less, and our improved methods of feeding, there is no difficulty here. As the cheapest good honey, such as all honey must be that is extracted from the cells without bruising them, would fetch from 1s. to 2s. per lb., it is a poor country where the average yield of ten stocks under our improved system would not give 15 lbs. of honey in the stock hive itself, after removing the supers. At 1s. per lb. ten hives would produce £7 10s.; deduct from this 15 lbs. of sugar at 3d. per lb., yielding, with an equal weight of water, 30 lbs. of food to each hive. This would give 3s. 9d. as the cost of feeding per hive, or £1 17s. 6d. for the ten; leaving a profit on the transaction of £5 12s. 6d., which would be no mean addition to a poor man's income; this too, bear in mind, in surplussage of his super-obtained honey.

I have only partially tried this plan, and I am not in a position to carry it out myself, but I venture to put it forward for ventilation among your apiarian readers. Will someone give it a fair trial, and report progress in these pages?—B. & W.

HYBRID VERSUS MONGREL BEES.

IT has been the habit of bee-keepers, when speaking of the cross between the common bee (*Apis mellifica*), and the Ligurian (*Apis ligustica*), to style their progeny hybrids. I think this must be looked upon as a misnomer, and the proper designation should be mongrels, as there is no doubt that both bees are of one species. In this all entomologists agree, and Dr. Gerstaecker even goes so far as to consider the Egyptian bee (*A. fasciata*), and another African species (*A. Adansonii*), as mere varieties also. Distinct species seldom voluntarily interbreed; whilst from the difficulty we find in keeping Ligurians pure we know our two bees commonly do. Darwin says, "First crosses between forms sufficiently distinct to be ranked as species and their hybrids are very generally, but not always, sterile. First crosses between forms known to be varieties, or sufficiently alike to be considered as varieties, and their mongrel offspring, are very generally, but not always, fertile." Breeders of cattle, poultry, &c., know well that the introduction of fresh blood from a distant source into their stock gives health and vigour to the subsequent young, and bee-keepers find the same law of nature holds good with bees. Establish a healthy Ligurian stock in our apiary, and the old inhabitants will take a new lease of life and strength. Entomologists are in a difficulty as to which

variety to rank as the species—whether to say *Apis mellifica* var. *ligustica* or *vice versa*. The first I think is the more generally adopted; but our distinguished hymenopterist, Mr. Frederick Smith, of the British Museum, seems to consider the most highly coloured as the typical form, and the possibility of its being more correct to give the precedence to *A. ligustica*, but that it cannot be decided satisfactorily until we know in what country *A. mellifica* really originated. Columella tells us that Mount Hymethus was celebrated for the best honey in all Greece, and that the ancients believed that bees were first bred there, and that all other bees were but colonies from that mountain. What a pity he does not go a step further and say if they were our friends with the golden bands, or their more soberly attired rival the old British bee.—JOHN HUNTER.

BEES AT THE CRYSTAL PALACE.

YOUR correspondent "A YOUNG APIARIAN" proves my case when he says, "I saw hundreds, if not thousands, of dead bees on the floor of the balcony devoted to the manipulation. I attributed the loss of life to the people treading on the bees which happened to settle on the ground." We are therefore agreed upon a monstrous loss of life which did not illustrate very forcibly to the well-dressed crowd, who flattened their noses in safety against the glass partition, the motto of "Never kill a bee," which Mr. Marriott constantly proclaims in the Palace—a result which certainly should be aimed at by all bee-keepers. I agree with "A YOUNG APIARIAN" that we are much indebted to the organisers of the bee exhibition, for they have taught us that the work of driving and making of swarms cannot be successfully performed—*i. e.*, without loss of life, under conditions such as must exist at the Palace.

The possibility of the labouring classes attending such exhibitions for the purposes of instruction is out of the question. The price is prohibitive. One shilling for admission to the Palace exclusive of railway fare, 6*d.* for a catalogue, and 6*d.* for admission to the manipulation, and a day's wage, is at vanishing point. I would suggest a more effective method, and one followed by me. The first artificial swarm I made was made to some extent in secret. My second effort was made in the presence of villagers who were asked to see me work. Since that I have had many invitations to drive my neighbours' bees, and these I have accepted where I thought it possible that my work would have the effect of diffusing knowledge; and I flatter myself I have done better service among villagers than even the much-bepraised bee exhibition of 1874.—BEATEN BUT NOT DISMAYED.

HONEY MARKET.

MANY small bee-keepers keep writing to me about a market for their honey. I wish I could help them, but I cannot. At Rusholme I found a market amongst private families for a great deal of honey annually. Here private families buy all I have at good prices. Both places are surrounded by wealthy people. Wholesale dealers both in England and Scotland write for prices; they evidently are anxious to buy honey. In Glasgow and Edinburgh there is a great consumption of honey. It would be easy to sell there at good prices all the heather honey gathered in England and stored in casks. The buyers there prefer it in jars called "honey cans," holding 5 lbs. each. Five pounds thus jarred are there called "a pint of honey." It cannot be safely sent a distance in jars; better take a smaller price for it in casks; better still to sell it near home if possible. In country places there may be a difficulty in finding buyers, but near large populations there should be little difficulty in selling good honey. There is a honey fair at Wrexham every year, and there honey, I am told, realises 1*s.* 4*d.* and 1*s.* 6*d.* per lb. If bee-keepers will try to create a market for the produce of their bees I am sure they will succeed. Publicity and a good article generally fetch customers. These statements are made with a view to prevent private inquiries being sent to me. It is of no use to write to me, for I will not give the names of buyers of honey. To name anybody publicly would cause many to write to him, and thus cause him to offer less than current prices. Another thing—I have not time to answer private letters.—A. PETTIGREW.

OUR LETTER BOX.

Poultry becoming light (Rather Anxious).—There is something wrong about your feeding. If your fowls and Ducks get nothing more than you describe, then we condemn the potatoes. We have always held them to be wretched poultry food. We hardly know the cause of the malady, but we will try to suggest a cure. Ducks throw physic to the dogs, they have a soul above it. We have given a Duck a tablespoonful of calomel at a time without the slightest effect. But just as one of the plans of treating a drunkard is to place him where he can get no drink, so we advise you to put your Ducks in an outhouse with an earthen floor. Supply them with a milk pan, the bottom of which must be covered with a sod of grass; this again must be covered with gravel, oats must be strewn on the gravel, and the whole covered with water. Let them have nothing else, and they will regain their appetite and their flesh. Give the pullet a tablespoonful of castor oil

every other day during a week. Feed only on barleymeal or ground oats slaked with water morning and evening. Feed at mid-day with maize or scraps. Feed scantily rather than otherwise.

PIGEONS AND BANTAMS OF FORMER DAYS (J. R.).—We think that the Pigeons you remember are what are now called Birmingham Rollers, very likely crossed with the Barb. Long-faced Barbs were then common, and often had a tuft at the back of their heads. These reared their young well, having fairly long beaks, and they were numerous. As to the Bantams, we have a distinct recollection of similar. They were a breed of Nankin-booted Bantams. The cocks were not then, as some are shown now, Buff, but Red with black breasts, and full-flowing tails and rose combs, and very handsome birds they were. They and all Bantams except Sebrights were larger then, as you rightly state. We have not seen such as you describe for many years.

PIGEON MARKERS (S. Turner).—Write to Messrs. Calton & Co., 30, Ludgate Hill, London.

NOTTINGHAM CANARY SHOW (J. Evans).—We cannot insert your letter.

TODMORDEN RABBIT SHOW (E. H.).—If your details are correct the Committee are liable for the loss of your Rabbit, and we think you could recover its value in the County Court.

BARLEY SUGAR (Triceps).—You have not boiled it sufficiently. Boil it until a drop falling on a cold plate speedily hardens.

METEOROLOGICAL OBSERVATIONS,

CAMDEN SQUARE, LONDON.

REMARKS.

- 14th.—Very dark at 9 A.M., rain at 11.30 for about an hour; fair but dark afternoon; rain at 10 P.M., and heavy rain at 11.30.
 - 15th.—Dark rainy morning; dry afternoon; distant lightning in the N.E. passing towards N. from 6 to 6.30 P.M., heavy rain at 8 P.M.; storm-like and oppressive all day.
 - 16th.—Very dark till noon; afternoon rather better, but still dull and rather dark.
 - 17th.—Fine morning; damp dark afternoon; improving in the evening.
 - 18th.—Rather dull morning, but clearing up soon after 11 A.M., and very fine all the remainder of the day.
 - 19th.—Rain early, but afterwards a very bright pleasant day.
 - 20th.—A very fine dry day, and though rather cold very enjoyable.
- Several dark dull days, but though sunless not cold. The mean temperature of this week still equal to that of the preceding one. The last two days much cooler.—G. J. SYMONS.

COVENT GARDEN MARKET.—OCTOBER 21.

SCARCELY any transactions of note occur here, business being very stationary. Dessert Fruits comprise Marie Louise, Chaumoutelle, Duchesse d'Angoulême, Glon Morceau, and other good varieties. Apples consist of Ribston Pippin, Cox's Orange Pippin, Fearn's, and many others, the season being most prolific.

From observations taken near London during forty-three years, the average day temperature of the week is 53.9°; and its night temperature 37.1°. The greatest heat was 67°, on the 31st, 1854; and the lowest cold 19°, on the 3rd, 1861. The greatest fall of rain was 0.98 inch.

LIFTING AND ROOT-PRUNING FRUIT TREES.

PEACH FAILURES.

HAVING in previous papers treated of the Apple, Pear, and Cherry, both on the free and dwarfing stocks, I propose in this to descant upon the lifting and root-pruning of trees usually grown on Plum stocks—viz., the Apricot, Peach, and Nectarine. I may at the commencement observe that the want of success in cultivating Peaches and Nectarines on walls has, by our friends over the border, been sought to be explained by an endeavour at showing our climate to have decreased in temperature. Admitting the theory that our earth is, and has been for several thousand years, gradually cooling down from its poles to the equator, it is stealing a march upon time and our advanced ideas to say what we shall in these regions ultimately find our conditions as regards climate to be—housed in snow, and clothed in skins, subsisting on seals and other dainties, with attendant comforts, of the present polar regions. Some may like to gratify their fancy by telling us what a very different climate we should have were an oceanic wave to obliterate from the map of the New World all Guatemala, Yucatan, and Honduras, or were such a small gap made through Panama as to let the waters of the Pacific Ocean mingle with those of the Atlantic; we, deprived of the Gulf stream, would have a climate comparable to Iceland, entailing loss of maritime supremacy and nobody knows what. These and other probabilities of what this land of ours was before we knew it, and what it will be when we have ceased to know it, are unquestionably delightful to minds ever tending to materialism in the vain hope of at last getting a glimpse of immaterialism; but the broad fact remains that our country, though it has been cooling for thousands of centuries, has yet a climate and soil in which we now cultivate more subjects foreign of warmer climes than indigenous. Drainage, cultivation, and manurial agents have given us what we lack in climate. To drain the land, as everyone knows, is to add a temperature of 2°, in some cases more, to its natural one; to cultivate is to do things at the right time in properly-prepared soil with after-attendant culture; whilst by manure we push on the crop—it tides over a cold period with the stimulant at its roots, and is sustained in a hot and dry medium from the humus of the manure and by cultivation.

Almost everything we grow has been found to be capable of cultivation in a lower temperature than was calculated. From our greenhouses has passed to the open air with benefit the *Aucuba japonica*; many Orchids at no distant date were roasted into life *alias* death, and the stewpans that were considered necessary for Ferns have all passed away, leaving them much more healthful in our temperature-decreasing climate. Albeit we have to look on the other side. Grapes were grown in this country long before glass was invented, and capital wine made of them, an art which seems to have been resuscitated by Mr. Fenn.

They are now grown against the walls of many cottage homes. I have seen them in North Wales, in Shropshire, and so far north as York; whilst in the sunny south Vines against walls are common enough. It is not to the point to say they are not equal to those grown under glass, but in the market they are of equal value with the majority of imported ones, which are also grown outdoors.

Peaches, also, and Nectarines have been grown in favourable positions from Land's End to John o'Groat's for at least more than a century, if not longer, with the aid of walls, and protection for the blossom and young fruit. Abercrombie, about 1770, gives as full and concise instructions for the cultivation of the Peach and Nectarine as we possess now. It has been calculated, by the late Mr. Thompson I think, that a favourable climate for Peach-culture is when the temperature of February is 40°, March 44°, April 49°, May 55°, June 61°, July 64°, and August 63°; but from Penzance in Cornwall to Sandwick in the Orkneys we have not the favourable temperature. We have, however, favourable positions enhanced by artificial shelter, the aid of walls, and protection, which give us a temperature of 4° to 5° above the natural one. Any place, therefore, having a mean temperature for February of 36°, March 40°, April 45°, May 51°, June 57°, July 60°, and August 59° ought to enable us to grow Peaches against south walls, with protection for the blossom and young fruit, but such is not the fact. In a temperature for March of 40°, April 46°, May 52°, June 58°, July 61°, August 59°, and September 55°, they do not fruit freely nor ripen perfectly. It is patent that the trees against a south wall enjoy for a shorter time the additional heat, being, out of the twenty-four hours, deprived of it for a longer time than it is secured to them, and the mean, therefore, of the temperature for the south wall and protection is made more than it really is from taking the extreme highest and lowest, or at distant intervals of the day and night; and in this way the increased temperature suffers a considerable diminution from the small amount of heat retained by the means adopted. So we must lower the resulting mean temperature of the south wall proportionately, or 2°, which will give us 3° as the temperature of a south wall over the surrounding atmosphere, which will cause us to raise the temperature of the natural climate to, for February, 38°, March 42°, April 47°, May 53°, June 59°, July 62°, August 61°—a temperature not possessed by any place of which we have record north of the Tweed. Southward, and in Ireland, we have many places with a temperature, aided by a wall and protection, favourable to the Peach and Nectarine ripening perfectly. There are spots even there which from altitude have an unfavourable climate, and very often these are not very distantly located. In a valley at 50 feet to 100 or 200 feet above the sea, and if well sheltered, the temperature may be such as to render Peach-culture on walls practicable; but at 400 to 500 feet above sea level it may be impracticable from the diminution of temperature due to altitude. In places north of the Tweed sheltered spots are found where Peaches are grown.

on walls with fair success. At one such in Perthshire Peaches are grown 10 and 11 inches in circumference, but they do not always have good flavour. We have it on the authority of Mr. D. Thomson that Peaches against a wall were uncertain, covered with glass they were improved; and now we have come to this—both in north and south Britain failures are recorded of the Peach crop in unheated glass structures. Nearly a dozen years ago I pointed out the uselessness of unheated orchard houses for the Peach in exposed, high, and cold localities; but this does not prove—the altered opinion of orchard-house promoters (I do not include Mr. Thomson)—our climate to have decreased in temperature, for the Greenwich observations show the contrary; but that cooling or cooled enthusiasm is enabled to perceive and acknowledge a failure as well as a success. It is absurd to conclude that because someone fails to grow Peaches in an unfavourable climate—in a cold and high exposed locality—he is a bungling fellow; whilst the one in a favoured climate because he succeeds, not of his greater knowledge or skill, is wondrous clever. It is from not considering the altered circumstances that the conclusion is arrived at that a failure in Peach-culture on walls is to be taken as parallel of the whole. A failure in one place unfavourably situated points to failure in the most favoured; for what difference can there be in places only a few miles distant from each other? Not much on a plane surface, which our island is the reverse of, and not very greatly differing in temperature, but so much so as to render possible in one locality what is not practicable in another. There is also diversity of moisture—of rainfall as well as of temperature—and of soil, exerting an influence, favourable or the reverse, upon the growth and perfection of fruits.—G. ABBEY.

(To be continued.)

WESTWARD HO!—No. 3.

I MENTIONED that although the main object of my visit to Bath had been frustrated by the sudden and severe illness of my valued friend the late rector, yet I had seen something in fruit-culture which I thought would prove of interest to the readers of the Journal; and as I lately designated Mr. Mount's garden at Canterbury a model Rose garden, so I may speak of the garden of Mr. Cross at Bath as

A MODEL FRUIT GARDEN.

And as in the case of the Canterbury garden it was situated in a place where no one would hardly look for it, so I am quite sure the garden I now proceed to describe would never be looked for in the position in which it is. Would anyone, I should like to know, look for a model garden of any kind in the small spaces attached to a row of houses? Would he, if he were given a space 100 feet by 30, ever dream of converting it into a fruit garden? And yet this is what Mr. Cross's garden is; and when I enumerate the number of kinds grown I rather fancy some will hold up their hands in astonishment. Well, here is the list:—Forty Apples, forty Pears, six Cherries, nine Plums, three Apricots, three Peaches, three Nectarines! The garden is of course walled-in; the south wall contains the Nectarines, &c., the west Plums, and the north Morello Cherries. There is a narrow border, and the centre of the garden is filled with the Apples and Pears, in some cases two or three sorts on one tree. The sorts grown are good. I saw Pear trees literally borne down by the weight of fine, well-formed, and large fruit. Cox's Orange Pippin and other fine Apples produced an abundance, while the Morellos on the north wall were really as fine fruit as ever I saw at an exhibition. And by-the-by, Mr. Cross gave me a wrinkle on the preserving of brandied Cherries. He says that the fruit ought to be put into the brandy alone, and the sugar not added for three months afterwards. In addition to the fruit growing Mr. Cross has a greenhouse, a lean-to, 25 feet by 13, and from an old Hamburg Vine in this he cuts annually three hundred bunches of Grapes averaging a pound each.

It need not, I think, after this be said that his garden is Mr. Cross's hobby, that the trees have all been formed and trained by his own hand, that he is a thoroughly practical man, and has many ingenious devices for the more successful culture of his pets. Some time ago people were complaining of the wire cutting the trees where the system of wiring walls is carried out; and Mr. Cross at that time wrote to the Journal (for he is one of us), and stated that the simplest way to prevent this was twisting the bast two or three times round the wire, and so preventing the friction. I may truly say that,

taking it altogether, I have never seen a more remarkable instance of what real love for a pursuit can do in the most unlooked-for places and under circumstances of no ordinary difficulty; and when people hereafter complain of the impossibility of growing fruit trees I shall think of Mr. Cross's garden at Bath.

As I mentioned, Bath was taken *en route* to Taunton; but it will readily be imagined that I was not likely to go to the latter place without calling in at Langport to see the Gladiolus of Mr. Kelway, and my last visit in this westward trip was paid to the

LANGPORT NURSERY.

Everyone who reads our Journal must know that the nursery has been made famous by the successful culture of the Gladiolus, and many have witnessed the proofs of that success in the marvellous spikes exhibited at the Crystal Palace, South Kensington, and elsewhere. For between twenty and thirty years Mr. Kelway has been pursuing their culture, and there can be no doubt that he has now a strain of flowers of unsurpassed excellence and of great variety of colouring.

Unfortunately neither Mr. Kelway nor his son was at home, but I had the advantage of going through his grounds with his foreman Mr. Drummond and of examining very many of his flowers. I do not think that on the whole his culture were quite equal to those of former years. In the early part of the year Mr. Kelway, jun., was laid by for many weeks with rheumatic fever, and hence, probably, the care required at planting time was not so freely bestowed; but still, what wonderful blooms there were there, and what fine, vigorous, healthy foliage! It would be idle for me to attempt to enumerate the sorts which I marked and noted in my memorandum-book as fine. Let me, however, note a few. Beauty of England is a noble white flower of large size and great purity; and even greater praise than this may be given to Phyllis, a lovely pure white flower. Batistus, flesh, flaked carmine; Ball of Fire, brilliant scarlet crimson; Rev. H. H. Dombain, soft red with white throat; Capt. Stuckey, dark crimson; Lady Bridport, bluish, flaked carmine; Hecamède, a yellowish flower; Orange Boven, a fine deep-coloured yellow; Harrison Weir, pink, with purplish white feather; Jones, something like Orphée, but larger; Acme, a fine long spike; Eclair, rich currant red; Pictum, salmon red flaked with carmine; Medina, white, shaded rose; Miss Phillis Stuckey, rose, white line on each petal. But there I must stop, for I could fill pages with an enumeration of fine and desirable sorts. As I have said before, there does not seem to be anything peculiar in the soil or cultivation to account for Mr. Kelway's success. It simply arises from this, that he has obtained a very fine strain of flowers and that he grows them well. His plants are, I think, unusually wide apart (2 feet); but he can afford the room, so there is no reason why he should not carry out his plan. I should doubt, too, the use of so large a quantity of manure for top-dressing as he employs. But then he would probably say to me, "See what it has done." No one looking at this noble collection but would desire to grow the flower; and were it not for the terrible drawback of the disease I am sure Gladioli would be much more extensively cultivated than they are. No one has done more by his own success and by the beautiful flowers he exhibits to extend their culture than Mr. Kelway, and a visit to his grounds at the blooming time is no ordinary treat.

This has ended my westward run. I have said my say about the Taunton Show; and I have only to repeat again what I have said so often before—that I have experienced nothing but the utmost kindness and good feeling from all lovers of flowers of whatever grade with whom I have been brought into contact.—D., Deal.

DATURA ARBOREA CULTURE.

This is a very old plant that little attention is paid to, but when well grown it is a very showy subject in September and October, and it is easily grown; but still, if not grown well it is worthless, and this applies to all sorts of plants. A well-grown Balsam is worth looking at, but a stunted one is worthless. If an eye of Datura is struck in March and kept in a frame for six weeks it will give twelve to eighteen blooms by September; and the following year, if cut down within an eye of the old wood, it will produce three dozen or so of flowers. It is a gross-feeding plant, and will take one-third of manure in a lumpy state and mixed with the soil. The points of the shoots are apt to be attacked with green fly, and must be well syringed also to prevent red spider. When done bloom-

ing it can be put into a shed or under a stage till spring, and disrooted and grown on. I used to grow six plants of it, and it was much cared for by the late Countess of Wemyss. I believe it would bloom out of doors in autumn in a warm sheltered spot.—JOHN ADDISON, *Ormiston, Tranent, N.B.*

MILDEWED VINES—AVOID A SPURT.

WHEN Ovid prescribed his well-known but I fear little-heeded remedies of love, one of the precepts he urged upon all desirous of getting rid of the tender passion was that they should look upon the dark side of everything.

"Ad mala quisque animum referat sua."

And as an instance of this he says—

"Est tibi rure bono generosæ fertilis uva:
Vinea ne nascens uva sit usta, time."

Which I render thus—

"A fruitful vineyard on rich soil is thine:
Suspect each berry mildewed on the Vine."

Such has been the actual case with my Vines this year. In an orchard house 120 feet in length my Vines have usually been most prolific, but this year the earliest leaves, and the wood also on which they grew, presented a mildewed appearance. The berries attained no plumpness, and were so utterly good for nothing, that I was surprised that even the wasps liked them. I shall be glad to know upon your authority whether it will be worth my while to retain these Vines. I may mention that I have observed other Vines on my neighbours' walls similarly affected. I send you a leaf, and "*ex uno disce omnes.*" My Peaches, on the other hand, have been plentiful and excellent, and have not only given me in succession fine fruit from the 14th of July till the beginning of this month, but have supplied many of my friends' tables also. So many blossoms set in the spring that my chief care was to thin. This I always do severely, for I remember when I was in the Oxford crew old Coombes, our trainer, used to say, when he thought our boat, "*juvenilibus acta lacertis,*" was going at a killing pace, "Govern yourselves, gents!" He well knew in a six-mile race the vanity of spurts, and that a long pull, and a strong pull, and a pull all together, was the correct thing. Well, sir, we lost our race that year, partly owing to our disregard of his instructions, though doubtless we should have been distanced anyhow, for the Cambridge was a clipping crew. There were two Denmans in it, the sons of a Judge who had himself walked when a young man from Cambridge to London, and the elder of the two destined to be a Judge, while the younger performed the same pedestrian feat. There was a Cobbold in it, who on account of his many-horse power was called "The Steam Engine," and a likely Westminster lad named Vials, whom we rather disrespectfully called "Bottles," the stroke ear. This, I know, is a digression; but patience, good sir, I shall soon come to my horticultural point. We became like exhausted trees from an overcrop of Peaches, for owing to an accidental circumstance, involving the catching of a crab on the larboard side, we came to grief at the start, and our stroke, anxious to make up for the ground, or rather water, lost by this disaster, and oblivious of Coombes' oft-repeated formula, "Govern yourselves, gents!" put on a terrific spurt before we had got our second wind; and although the immediate result of this ill-advised burst was nearly to overhaul our opponents at the Horseferry (we used to row from Westminster to Putney in those days), yet after that we saw no more of them until we met them at dinner at the Bells Tavern, for no Lord Mayor used to ask us to dine then; if he had we should have sent him a prompt and civil reply.

Well, but now to my application. When my Peach trees are covered with early fruit I say to them, "Govern yourselves, gents! Do not exhaust yourselves by overdoing it, and taxing too much your latent energies. Slow and steady wins the race." And I take the liberty at stated intervals of divesting them of their redundant fruit until I have reduced them to about one Peach per square foot, and the result is not only plenty of Peaches, but fruit large, well ripened, and delicious.—A CONSTANT READER.

Question.—Does "*usta uva*" mean a mildewed berry?

[How shall we answer such an *olla podrida* of queries and information, in phrases varying from "lively to severe?" (we should have written "serious" instead of "severe," but there is one syllable too many)—we will endeavour to respond in unison. Your Vines are severely mildewed. Burn all the leaves when fallen, then paint the entire viney, and Vines,

stems, and branches, with a creamy mixture of clay, lime, and flowers of sulphur; pare off an inch of the inside border, and dust the whole of the surface with flowers of sulphur. Judging from the leaf sent, we think the house is kept too damp and too little ventilated. Then as to thinning Peaches—and the apothegm applies to all fruit—old Coombes' warning was applicable; and we remember an old clergyman, who must have been "A CONSTANT READER'S" fellow student at Oxford, who thinned the crops of his dwarf standard Apple trees unmercifully, and who used to observe, "I wish my parishioners could thin their families like that."

"*Usta uva*" may mean a mildewed Grape; but as we know of no mention in any of the Latin Scriptores Rei Rusticæ or Geoponic authors who mention mildew by any other name than *rubigo*, we incline to think that Ovid took his simile from what gardeners now term "the rust," not only because it agrees with the interpretation of "*usta*," burnt or browned, but because it also is early noticeable upon outdoor Grapes, which alone were known to the Romans; and that young berries were referred to seems indicated by employing the term "*nascens*," beginning to grow.—EDS.]

NOVELTIES IN THE ROYAL GARDENS, KEW.

In the Temperate house in flower is the beautiful *Lapageria rosea* var. *alba*. The flowers are of the purest white, and chaste in form. To show them to the best advantage the plant must be trained above the level of the eye, and it is then an object of great elegance. This may also be said of the species, to which, of course, the treatment we shall give applies. It does well in a greenhouse, in shade or otherwise, and may be grown with success in cool ferneries and Orchid houses. Except when required for special purposes, it is always best to plant out; greater success is insured, and with less trouble. Good drainage is essential. The soil may consist of rough peat and loam, chiefly of the former, with which may be mixed pieces of sandstone or broken bricks. Care must be taken not to have the mass too solid. Snails are extremely fond of the young shoots, and it is necessary to guard against them. It is a good plan to use the hollow rings of earthen ware filled with water as for Dahlias. Increase is effected from cuttings or layers, and also from seeds, which must be secured by artificial impregnation, as the fruit does not set of itself. It is very nearly, if not quite, hardy. An old plant taken from one of the houses has lived on the wall of the herbaceous ground for the last two winters, and though much punished by removal, has been gradually recovering. We hope soon to hear of the *Philageria Veitchii* being sent out. It is an interesting hybrid, obtained by the Messrs. Veitch between *Lapageria rosea* and *Philesia buxifolia*; the former was fertilised with pollen from the latter, the result is nearly intermediate, inclining to *Lapageria*. *Philesia* is thriving on a rock-work in this house, where it is very ornamental when in flower. It does well with the same general treatment as given for its ally, but being a dwarf shrub requires a different position, and may rightly be planted on a rockwork devoted to Ferns. We recommend a trial out of doors, it having been described as "probably hardy."

Rhodochiton volubile trained on a wire has a very pretty appearance. It is an old acquaintance that should not be forgotten, though now but little cultivated. The leaves are heart-shaped and handsome. Flowers are produced in profusion, and long after the corolla has fallen the large pink calyx remains, forming in this case an attractive line of colour. Cuttings may be struck, selecting the small and less vigorous branches. It is a native of Mexico, and is allied to *Lophospermum*, from which it differs but little.

Cyathea medullaris is one of the noblest of tree Ferns, and a plant in one of the beds is, perhaps, the finest to be seen anywhere. It is about 24 feet high; the fronds are about 12 feet long, and those that are withered hang down, affording a natural protection to the stem, preserving it from undue dryness. A noticeable feature is the violet black colour of the rachis of the fronds. The spores may be sown in 5-inch pots; half fill with drainage, and then add a mixture of peat and small crocks to within an inch of the top; over the mouth place a piece of glass, and stand the pot in a saucer of water. The young plants should be pricked-out separately as soon as they can be distinguished. While on the subject of raising, we may remark that most Ferns for furnishing purposes are best managed by pricking-off little clumps of the prothallia before the fronds appear, to be grown-on without separation

into individual plants. Neat specimens are quickly obtained by this method; it, of course, does not apply to tree Ferns. *Cyathea medullaris* is one of the few Ferns of economic use to man. The soft inner portion of the stem, which resembles sago, is commonly used as an article of food by the natives of New Zealand and the Pacific Islands.

STRAWBERRY CULTURE.

ALLOW me to add my mite of information on the above; and in answer to "AMATEUR, Cirencester," in your number for the 15th inst. respecting the Early Prolific thriving, I can with confidence say that it did well with me the last two seasons at Sion Hill, Kidderminster, bore an excellent crop of fine, handsome, good-flavoured fruit, and made good growth and plenty of runners. I also saw it forced in pots just as the berries were ripe, and a finer crop no one could wish, and the flavour excellent. I consider it a valuable addition to our early Strawberries, although with me it was a few days behind Black Prince. The sorts I grew were Prolific, Black Prince, Keus' Seedling, President, Dr. Hogg, British Queen, Sir C. Napier, and one called Shropshire Hero, very large; and the best three were Prolific, President, and British Queen. I consider President next in point of flavour to British Queen, which kind, when the soil and situation suit them, to my mind is first-rate; but I think three years long enough for the plants to stand to supply fruit of good quality and flavour. My practice is, as soon as the first runners are formed, to put them on pots filled with soil, with a stone on the wire: they will soon take root. Have a piece of ground prepared, and then plant out 2 feet between the rows and 18 inches from plant to plant. I keep the ground free from weeds, but never stir the soil between them except with the hoe from the time they are planted till they are taken up; but every spring after they are cleaned I well cover the ground between them with good fresh stable dung, so that it acts as a manure, and the rain washes the straw clean so that there is no grit on the fruit the following summer.—S. TAYLOR, *The Gardens, Castlecroft, Wolverhampton.*

COLONIAL BOTANICAL GARDENS—CEYLON.

IN the last number of your Journal you alluded to the neglect of the cultivation of that valuable plant the Cinchona at St. Helena, and it may, perhaps, interest you and your readers to learn with what praiseworthy energy my friend Mr. G. H. K. Thwaites, the accomplished Director of the Botanical Gardens in that garden of the east, Ceylon, pursues his interesting labours.

CINCHONA.—I have before me the Director's report for the current year, and I gather from it that there is very great activity going on in the cultivation of Cinchona in the island. During last year applications were most numerous, and some 670,500 plants were issued, and this did not meet the demand. This issue does not altogether represent the extent of the Cinchona cultivation, since many of the Coffee planters located at suitable elevations within the mountain zone are forming nurseries of their own for the propagation of plants from seeds and cuttings. Cinchona succirubra appears to be principally in request at present, as it is deemed the most suitable species for the elevations at which Cinchona is planted, growing more rapidly, and consequently yielding within a given time a larger bulk of bark than would be furnished by the Cinchona officinalis; still a good deal of the last-named very valuable species is being grown at elevations exceeding 4000 feet above the sea level.

COFFEE.—The Coffee-leaf disease (*Hemileia vastatrix*) is still existing in many of the plantations in the island. Mr. Thwaites states that the disease consists in the parasitic growth within the Coffee tree of a well-defined species of fungus, originated and produced by means of spores, easily identified by the medium of the microscope, and readily distinguishable from every other known fungus. The fungus has only yet been detected in a definite organised form in the cellular tissue of the Coffee leaf lying immediately under the diseased spots, in the spores themselves, and in the filaments produced by the germinating spores. The fungus would appear, however, to be present in the growing tissues generally of the Coffee plant in a diffused form, altering the character of the cell-contents, and thus producing the stains observable on the bark of the young branches, and the pale, somewhat translucent spots to be seen in the leaves previously to the outbreak of the orange-coloured spores. Secondary spores have also

been observed under the microscope, which may, doubtless, be easily carried by the wind, and thereby convey infection to other plantations.

The Coffee tree under the first attack of the disease would seem to lose by degrees its vital energy. After the first attack fresh healthy leaves are often thrown out, but after a time the spotting appears on them, and the leaves fall off. The Coffee trees, after these repeated attacks, if old, and the soil of the plantation be poor, cease to yield berries to any extent. Mr. Thwaites has good reason to believe that the Coffee tree is much better able to resist this fungus if the soil has been highly cultivated and manured with discretion. Numerous small maggots have been discovered feeding on the epores. It is to be hoped that this useful maggot will become a very legion. A few Coffee plants have been received from the Gold Coast, and sent to Ceylon by Dr. Hooker, of Kew, but they have been attacked, I have just been informed, by the disease. It is quite certain that the present Governor of Ceylon (Mr. Gregory), and the accomplished Directors of Kew and Ceylon Botanical Gardens, will do all that energy and science can achieve to arrest this terrible pest. The result will be most anxiously watched by those who have invested very large sums in Coffee cultivation in the colony.—E. RAWDON POWER, *Ceylon Civil Service (Retired).*

WOOLHOPE NATURALISTS' FIELD CLUB— THE ANNUAL FUNGUS FORAYS.

THE opening muster of the mycologists proper took place on the 29th of September, and a select band arrived at Downton. The foray began under the leadership of Dr. Jones. The fame of "the gorge of the Teme" for its lovely scenery is world-wide. The river rushes through a stony channel, now broad and rippling, and again contracted, deep, and silent, whilst its banks are fringed everywhere by the richest variety of woods. It is indeed a lovely valley, though not for its loveliness was it visited on this occasion. Here is the only known British home of the brilliant-coloured Cortinarius (*Dermocybe*) cinnabarinus, and of the *C. militinus*, and here, too, in favourable years grows abundantly the rare *Pir Cone Boletus*, *Strobilomyces strobilaceus*, while on its mossy banks and promontories are to be found other Funguses rare and interesting. Think of this, and shake off the scales of your mental obfuscation!

At the Castle Bridge on an Elm branch a fine *Agaricus* (*Pleurotus*) ulmarius was observed and gathered successfully. Though abundant in the parks and neighbourhood of London, it is rare in Herefordshire, so that we may as well note that it is pleasant and said to be edible. We should suspect it would need a power of stewing to make it tender. Almost at the entrance of the walks the foragers were encountered by a heavy storm of a full hour's duration, which, however, did not stop the hunt or damp the curiosity of the hunters. *Marasmius foetidus* gladdened their hearts, however much it might offend their noses, and its sister *Marasmius erythropus* was pleasant to their visual organs. Why will people keep sniffing at things unpleasant when they know what to expect? At Downton the sweet-scented *Lactarius glycosmus*, *Agaricus* (*Clytocybe*) odoros and fragrans were at hand; and so, too, in plenty was *A. (Hebeloma) pyridorus*, which has a strong odour of Pears beginning to ferment, so that savours more agreeable or less disagreeable as the taste may incline, were not wanting. On a charcoal bed—a "charking place" in the woodman's vernacular—one of the most graceful and beautifully coloured forms of the variable *A. (Omphalia) pyxidatus* delighted the eyes of the fungologists, lifting away the depressing influence of the rain, which was just then at its heaviest. Ordinary mortals may be afraid of rain; a fungologist has but to retreat under sheltering rock or tree, and wholly forget its importunity in the contemplation, as in this case, of the rare *Peziza succosa*, or the *Pezizella Soleia ochracea*, not to mention *Lactarii*, *Cortinarii*, *Boleti*, and *Hygrophori* growing all around in the utmost profusion and variety.

After a short halt in the rustic arbour at the mill (which it was pleasant to see at work), to admire the lofty rocks, and to sketch a picturesque and many-headed boll of a Wych Elm, the way was taken up the highest walks to "Renny's Promontory," a name perhaps not of local significance, yet henceforth never to be forgotten in mycologic lore. It is a high moss-covered promontory, thinly studded with trees, moist though well-drained, damp and yet airy, a very paradise for Funguses. To see them in a favourable season covering the ground here is a sight to remember. Rare Funguses affect the spot. It was here in 1872 that Mr. Renny discovered the brilliant Cortinarius (*Dermocybe*) cinnabarinus growing in clusters, each richer and more dazzling than its fellow just gathered; a bright orange vermillion in colour, with a metallic lustre that defies water colours to imitate. Here, too, in the following year Dr. Bull

found *Cortinarius multiceps*, equally new to the British flora, though by no means so striking in colour or form. The season of 1874 has been so dry and unfavourable that finds were scant on this occasion. The Rev. W. Houghton was the first to find *cinnabarinus*, and a cry of joy quickly summoned his co-mates to admire its lovely tints. Smaller groups were afterwards found, and so the day's foray was a success. True, *Strobilomyces strobilaceus* was not found, though keenly searched for. It is clear that it does not like dry seasons. But many other interesting varieties yielded themselves to the quest of lymx-eyed foragers—e.g., the pretty and not common *Ag. (Amanita) Mappa*, the rare Hedgehog Puff-ball *Lycoperdon echinatum*, *Coprinus picaceus*, *Ag. nanus*, obscure, ermineous, unicolor, &c. A stroll was taken on the slopes of Brimwood Hill to search the open ground and examine some curious trees, but as time was nearly up the note of recall was sounded, and at the rendezvous of the Castle Bridge a beautiful group of *Ag. (Pholiota) heterochitus* was gathered by Mr. Broome from the roots of a Lombardy Poplar. Here a pleasant and welcome hamper turned up, and anon the tired hunters were *Fortey-fied* and refreshed with the Melton pie, chicken sandwiches, and sparkling Carlovitz which formed its contents. The journey back to Ludlow by Oakley Park and Bromfield Church was singularly bright and cheerful, and this not entirely through pleasant memories of the Carlovitz; for the sun shone out again to give the climax of its warmth and cheerfulness to the satisfaction of a good day's work. At Bromfield an ample supply of *Marasmius oreades* and of *Lactarius deliciosus* was secured for the next day's feast, and so, with laden baskets, the excursionists caught the return trains, after a foray very pleasant and satisfactory, the rain notwithstanding. Though the Fungus season in Herefordshire is confessedly unfavourable, upwards of a hundred different species were observed in the excursion of September 29th.

The foray of Wednesday was fixed for Dinmore Hill, a locality which had proved so rich and fruitful in former years (see Transactions of 1871) that it was deemed advisable to revisit it on the bye day. Nor was the idea a bad one, for many interesting plants rewarded the visitors. The rare *Ascobotrys viridis*, *Ag. (Collybia) plexipes*, *Peziza repanda* and *brunnea* were found. The *Sphaeria*, *Cordiceps alutacea*, which is very rare, and usually, if not always, in company with *Spathularia flavida*, was also welcomed. Three specimens of *Ag. (Leptonia) euchrous* also fortunately yielded themselves to gathering—an *Agaric*, as its name imports, of singular beauty, with lovely tints of violet, varying as the light falls upon it. This has not before been observed in Herefordshire. Here, too, were found *Hygrophorus muricatus*, a great abundance of *Ag. (Naucoria) cucumis*, and many other very interesting fungi.

During the night preceding the grand field-day of the week, and following the novel introduction into the dinner *menus* of certain hospitable mansions of *salmi* de *Lycoperdon giganteum*, *salmi* de *Lactarius deliciosus*, and a sauce for cutlets of *Marasmius oreades*, on the evening of the 30th the clouds dropped water to the extent of 1½ inch, and there were grave doubts whether the foray to Stoke Edith could come off. Hopeful members—up and doing with the day dawn—were fain to occupy themselves at the tables on which the Fungi were arranged for exhibition at the "Green Dragon," and to postpone a decision until 9 15 A.M., when, an adjournment having been moved to the street, it was found to be still raining at 9.30. Adjourning again to the Barr's Court Station at 9.45, their faith and patience were rewarded by a brightening sky, and though occasionally the clouds lowered, and the night's rain had made the atmosphere cold and the ground slippery and treacherous, a very pleasant day repaid those who had the courage to venture. Some five-and-twenty repaired to Stoke Edith by train, where they were joined by the President (the Rev. James Davies), who had been kindly accommodated with a seat in Miss Guthrie's carriage, in which were Miss Guthrie herself, Mrs. Lloyd Wynne, of Coed Coch, and Mr. Washington Jackson. The noble owner of Stoke Edith, Lady Emily Foley, had most considerately placed her head gardener and head keeper at the services of the forayers, and thus the delays arising out of defective and speculative guidance were pleasantly minimised. The short grass of the shrubberies was, as usual, excellent hunting ground; but the most memorable finds of the day were as follows:—The rare yellow *Hygrophorus chrysodon*, showing clearly its colours on the slightest bruise; a great profusion of *Ag. (Armillaria) mucedo* on the Beech trees, in a larger and finer condition than is often seen, the larger specimens being from 4 to 6 inches across; a lovely segment of a circle of the Fly *Agaric*, *Ag. (Amanita) muscaria*, too beautiful not to be commemorated; and a very curious *Amanita*, not fully grown, which it puzzled the experts to discriminate and determine. It might be a young giant of a *Vaginatus*, but the scales were not right, nor was its edge serrated. Or it might be a young *Strangulatus* or *Excelsus*. A nut for the mycologists to crack! An eye must be kept on the spot for future examination. Here also, as on almost every foray, was found the interesting *Hygrophorus calyptraeformis*;

nowhere, however, in great abundance. To those who joined the excursion to Stoke Edith, albeit on a day little favoured by sunshine, there were several other attractions, scarcely secondary to the prime motive of fungologising. The flower garden, geometrically arranged by Nesfield, is as perfect a thing as can be seen in a long day's survey of parks and gardens. It is oddly brightened, too, when the bloom is yielding to the early frosts, and spiteful winter forecasts its shadow—by the bright red cloaks of the women who weed the gravel paths of varied shape and colour. Beyond its precincts, up a succession of undulating slopes, stretches an ample deer park, magnificently timbered, and reaching up to the lofty ridge of Seager Hill, whence a carriage drive commands a grand and extensive outlook of the valleys and hills of Herefordshire, Gloucestershire, and South Wales. Beneath it, southward, lies the Woolhope country, which seems to say to the club flowers, whom it has christened, "*Antiquum exquirite matrem*." For the mansion itself, its hall, library, pictures, and tapestry—the last exceedingly curious and well worthy of minute inspection—our readers may refer to the "*Mansions and Manors*" of the President elect. Our space at present admonishes us to take wing, if thought, for Hereford, where—despite the charms of Stoke Edith—a committee meeting awaits the President of 1873 and 1874, to say nothing of the feast and the presentation, which attract as great an interest for many as the forays.

Amongst the Fungi on the "Green Dragon" table we noticed specimens of the *Ag. mucilus*, measuring half an inch more than the largest of those at Stoke Edith; and a splendid sample of the lovely *Peziza aurantia* (8½ inches across)—both sent from Shobden by Lord Bateman. Mr. Houghton exhibited from the Fir plantations of Chetwynd Park, where he has found them year after year, failing last year only, a good specimen of *Sparassis crispa*. Dr. Chapman contributed from the pastures about Hereford a magnificent group of *Ag. (Volvaria) gloiocephalus*, each *Agaric* being 10 inches high, with pilea 17 or 18 inches in circumference. The odour of them is not nice. Near these also was *Agaricus Junonius*. Mr. Berkeley had sent *Leotia circius*, received by him from Scotland; and from Abergavenny Dr. McCullough had brought *Lactarius controversus*, on which he alighted the next day again growing, abnormally we should say, under a Lombardy Poplar. Radalium fagineum, *Lactarius vitellinus*, which Mr. Worthington Smith declines to recommend as edible, however fond of veal some non-Woolhopians may be, and one or two other somewhat rare plants excited and satisfied curiosity. Amongst exceptional contributions to the Fungus Exhibition were a fresh-water sponge from the river Teme, sent by the Messrs. Fortey, and some gigantic rhizomes of the Water Lily, brought by Mr. William Phillips. Amidst this class, had it not miscarried, would have been exhibited a splendid box of the choicest Pears of English growth, sent to the President by Mr. Richard Doddridge Blackmore, M.A., of Exeter College, Oxford, poet, novelist, and market gardener. They might have taught the visitors to the "Green Dragon" to discriminate between the *Beurré*s and the *Doyenné*s, *Louise Bonne*s, and *Marie Louise*, and distracted the lovers of Fungus forms by the weightier claims of pomology. The feast, and the soirée which followed it, were as successful and cheery as their predecessors; and what between the presence of ladies and the festive board, an unanimous delight in the unfeigned surprise of Mr. Worthington Smith at the recognition of his constant services, a pleasant memory will long invest the evening of the 1st of October, 1874.

After the great Fungus dinner, when great tureens of *Coprinus comatus* soup, *Lactarius deliciosus*, and *Boletus edulis* were served, and after the health of the Queen had been drunk,

THE PRESIDENT (Rev. James Davies) rose and introduced the next business of the evening, which he was sure would take no one there by surprise, unless it was, as he hoped and trusted, the person most concerned. As he had been in communication with most of his hearers on the subject, he might at once dash *in medias res*, and state that some three weeks ago a happy thought occurred to Dr. Bull (who, with his usual kindness, admitted him into the partnership of it) that the Club ought no longer to leave unrecognised and unacknowledged the great and gratuitous services of Mr. Worthington G. Smith as its "Mycological Professor," and as one who was ever ready to assist their studies with his pen, his pencil, and his head. Among the literary men he (the President) had met, there were two prominent types—the hoarders of their knowledge, who lived in dread of "a chiel among them takin' notes," and the generous and unselfish communicators and diffusers of the information which they have amassed by patient inquiry. One example of the latter type was the late Sir George Lewis; another, in his way and walk of science, was Mr. W. G. Smith. Every Woolhopian knew he could count upon the free use of Mr. W. G. Smith's experience, and of his very extensive and accurate information. Having himself realised this during his two-years presidency, he (Mr. Davies) readily undertook to co-operate with Dr. Bull in sounding the members of the Club, by letter or word of mouth, with reference to a testimonial, marking the sense of their

gratitude and indebtedness; such testimonial to take the form of silver forks and spoons. The result of their canvas had been an unalloyed success. There had been two ghosts of an alloy, but they vanished almost on the instant of appearance. One gentleman began a letter by denouncing testimonials generally in the strongest terms, but went on in the second page to say that were his objections multiplied a hundredfold, he should still rejoice in the privilege of having had the opportunity to mark by a subscription his great sense of Mr. W. G. Smith's deserts. Another sent a subscription with a letter full of complimentary expressions, and concluding with a hope that the forks and spoons might never assist Mr. Smith in conveying to his mouth poisonous Fungi, which might terminate his career of usefulness. The thought might cast a passing shadow, but reflection told him (the President) that if there was a man in Europe who could be trusted to discriminate between edible and inedible Fungi, that man was Mr. Worthington Smith. In token of their sense of his helpfulness in extending this discriminative knowledge, as well as their regard and goodwill, the Club had deputed him on this occasion to present to Mr. Smith the ashen box which he held in his hands, with the plate which it contained, and he begged him to accept it, to quote the language of the superscription, "in pleasant memory of Fungus-forays, assisted by his experience, illustrated by his pencil, and chronicled by his pen."

Dr. BULL then rose, and after playful allusion to the relative shares of the President and himself in originating this testimonial—a mystery, like the origination of the Franco-German War—went on to say:—The pleasure of the correspondence had also been shared by myself, for it was indeed a great pleasure to read the cordial kind letters received from the members applied to; and when the lithographed circulars were sent out by our President, every post might be said to bring in a fork or a spoon, until our friendly gift—originally small in our ideas—had become really a valuable one. Everyone felt that it was a present really deserved from our Club; and it may be said without hesitation that this feeling will be echoed far and wide through the country. Our Club has done itself honour in giving such kindly expression to their obligation; and all those who have written to Mr. Smith from all parts of the country, asking the names and other information about Funguses, will feel how worthy Mr. Smith is of it. Not to mention the time and patience he has given to all applicants—strangers as well as friends, it must have cost him no small sum in postage stamps alone to reply to them. Our President has not told you how useful that mystical individual, "Our Own Commissioner," was to us. He set to work at once, ornamented the inscription plate with Funguses, and sketched out a design for engraving on the lid of the box. There was not time to carry all this out; but he insisted—and I fully agree with him—that every fork or spoon, in place of crest, should bear a Fungus on its handle—each a different one, and all of them to be copied from the plates published in our "Transactions," or to represent the Funguses new to Britain discovered by our Club; so that the friendly pleasant days he has passed in Herefordshire will be always recalled to him as his eye falls on a *delicious* spoon or *procerus* fork. So a kindly feeling will pervade his domestic everyday life. [Applause.]

Mr. W. G. SMITH, who was warmly applauded on rising, said there was one thing which he never could do, and that was to make a speech, but he felt this inability all the more on that occasion, when he was surprised with such unexpected kindness. He had been thinking only that day how much he was obliged by the unvarying attention and courtesy shown to him in Herefordshire, and he really felt that it was he who ought to make a presentation to the Club rather than the Club to him. He could only add that he prized their splendid gift very highly, and should always feel himself greatly indebted to their kindness. [Applause.]

On the morrow, October 2nd, when the majority of the Woolhopians had gone away, nothing damaged by the fungoid soups and salmis, to their own homes, a staunch and privileged section set out for Garnstone Park, the seat of Major Peplow, M.P. The party slighted in front of the modern castellated mansion, built by Nash, and were welcomed cordially by its hospitable proprietor. No time, however, was lost in beginning operations, though at times an umbrella or the shelter of a tree was a necessity to the most ardent. The lawns and gardens were first inspected, with an eye primarily to rare Funguses, but not without an interest in the horticultural features which distinguish them. The flower garden is effective and uncommon; but the chief thing to note at Garnstone, in the lawns and outside of them, is the fine growth both of Conifers and deciduous trees, which have evidently a very congenial soil and a life entirely to their mind. Visitors of arboricultural tastes could not help lingering behind the foray party to note the Piceas and Pines, Cedars and Junipers of rare sorts, and speculating on the future of a thriving young *Picea bracteata*, or admiring the grace of a *Pinus* or *Norfolkiana*. On the croquet lawn, to return to our chief quest, were found three small rings, and very perfect

rings too, some 2 feet in diameter, of *Hygrophorus russocoriaceus*, scenting the air with a scent as of Russia leather. Hard by them Mr. Renny found a Fungus new to Great Britain, *Ag. tricholoma livivius*, a very interesting plant. Before quitting the lawn for the deer park the hunters came upon *Clavaria rufa* and *Hygrophorus Colemanianus* in abundance, and in the entrance of a small outbuilding which need not be particularised was pointed out a rare instance of *Coprinus domesticus*. Then the mycologists at length broke away for the hillside at the far end of the deer park. Many and curious species of *Cortinarius* were met with *en route* to the hill, from which there was a very fine and panoramic view of West and North Herefordshire, and the hills that bound it, to say nothing of the sleepy but quaint little town of Weobley, just beyond Garnstone. On the frequent charcoal heaps met with in ascending the hill were found *Ag. carbonarius* with *Ag. pyxidatus* and *Cantharellus radicosus*; and, when the ascent was made, Dr. Bull found *Ag. Entoloma jubatus*, a very rare Fungus, first figured as a British plant in the *Woolhope Transactions* for 1868.

It may be noticed generally, as the effect of a very dry season up to three or four weeks ago, that many tribes of Funguses, such as the Boleti, were almost absent. Still *B. Laricinus*, only known within the last few years, was very abundant. *B. elegans* and *B. fragrans*, too, were beginning to appear. The very common *Ag. fascicularis* was scarcely to be seen, though its intimate relation, *sublateritius*, was frequent enough. *A. (Nau-coria) Cucumis* was very common, as also, even more, was the curious *Hygrophorus coeasus*. In many places visited during the week this was noticeable with its odd and gosh-like smell, amongst others in an orchard at Stoke Edith, near the station, where a ring of it was found some 8 feet in diameter. Then, again, the great scarcity of all the tree Polypores was remarkable, so much so as, with the other absences we have referred to, to demonstrate the unusual unproductiveness of the season, in a mycological point of view, arising out of the impossibility of mycelium growth taking place in such very dry weather.

Some such train of thought was passing through at least one mind out of the thirteen or fourteen that visited Garnstone Park, when a summons to return to the mansion interrupted it. Here a handsome luncheon had been provided, to which, after they had inspected some admirable photographs executed by Major Peplow, the mycologists did thorough justice.—(*Hereford Times*.)

ROYAL JERSEY AGRICULTURAL AND HORTICULTURAL SOCIETY.

THE autumnal Exhibition was held in the Vegetable Market, Beresford Street, St. Heliers, on the 14th inst. The fruit in the Apple and Pear classes were superlatively fine, as the weights of a few of the largest varieties will show. The Chasmontel classes were grand examples of the perfection to which this delicious Pear is grown in the island. They were truly wonderful fruit, smooth-skinned, evenly-shaped, and of extraordinary weight. The first-prize fifty weighed 59½ lbs. Jersey weight, or 64½ lbs. avoirdupois; a more evenly selected lot I never saw, and grandly coloured. The Belle de Jersey were immense, the first-prize twenty-five weighing 53 lbs. 9 ozs. avoirdupois, and the first-prize six 20 lbs. 2 ozs., whilst one fruit not in the competition weighed 31 lbs. 18 ozs.

The better varieties of dessert Pears, to which especial attention is given, were so large as to be scarcely recognisable, six *Beurré Bachelier* weighing 8 lbs. were immense fruit. Six General Todtleben vied with the Belle de Jersey for size, but they are not comparable for quality, the former being a first-rate table Pear. Six *Beurré Clairgeau*, the best dish in the Show, were beautifully coloured and most symmetrical—a truly grand dish, their huge size and bright tints of yellow and red attracting the eye, making visitors involuntarily pause to admire; their weight was 10 lbs. 8 ozs. The tree from which these magnificent fruit were picked is a wall tree 10 feet high by 7 feet wide. It bore thirty-five fruit, the total weight of which was 564 lbs.

The Apples were very fine, and the entries very numerous. Grapes were a bad class. Peaches and Strawberries very fine. Walnuts, Chestnuts, and Medlars very fine.

As Pears are my hobby you will excuse my not dwelling on the other kinds of fruit, as I fear I could not do them justice, nor to the vegetables, which I believe were also good. The following is a list of the Pears exhibited, with the weights of such as struck me as especially noticeable:—50 Chasmontel weighed 59 lbs. 12 ozs.; 25 ditto, 28 lbs.; 12 ditto, 12 lbs. 8 ozs.; 6 ditto, 6 lbs.; 25 *Beurré d'Arenberg* (Glon Morçean); 6 ditto, 6 lbs. 10 ozs.; *Beurré Diez*, one fruit, 1 lb. 10 ozs.; 25 *Duchesse d'Angoulême*, 28 lbs.; 12 ditto, 13 lbs.; 25 *Belle de Jersey*, 49 lbs. 10 ozs.; 6 ditto, 20 lbs. 2 ozs.; 25 *Catillac* or Pound Pears, 40 lbs.; 25 *Doyenné du Comice*, 18 lbs.; 6 *Beurré Clairgeau*, 10 lbs. 8 ozs.; 6 *Beurré Bachelier*, 8 lbs.; 6 *Van Mons Léon Leclerc*. Six fruits of each of the following weighed 9 lbs. 6 ozs.:—General Todtleben, De Tongrea, Marie Louise, *Duchesse d'Hiver*,

Maréchal de la Cour, Triomphe de Jodoigne, Beurré Rance, Bergamotte de la Pentecôte [Easter Beurré, Bezi Mai, Crassane, Winter Nelis, Soldat Laboureur, Passe Colmar, Napoléon, Doyenné Defais, Alexandre Lambré, Doyenné Sterckmans, Grashin, Doyenné d'Alençon, Joséphine de Malines, Mathew's Eliza, Forelle, Sœur Grégoire, Beurré Buchannan, Ne Plus Menris, Anna Audusson, Brown Beurré, Président d'Osmonville, Jules d'Airolles, Neuf Maisons. The weights given in the above list are Jersey weights, each pound being equal to 1 lb. 1½ oz. avoirdupois weight.—*VERITAS, Turf Bank, Jersey.*

BORDER FLOWERS.

Now that the brightness is off the formal flower beds, it may not be uninteresting to some of your readers to learn what we have in the mixed borders worth looking at. The following is a list of plants in flower on October 19th. Fine-foliaged plants, of which there is a great variety, are not named, as it is believed they are better known:—

Asters, annual and herbaceous	Violas in variety
Antirrhinum in variety	Sedum Sieboldii
Pentstemon ditto	Salvia patens
African Marigold	Erica in variety
Dahlias in variety	Catananche bicolor
Fuchsias ditto	Achillea Ptarmica plena
Mignonette	Polygonum vacinifolium
Tree Carnations	Chrysosoma Linosyris
Anemone japonica	Coronilla glauca
vitifolia	Coreopsis auriculata
Homarine Jobert	Gent. coccinea
Sedum purpureum	Vittadenia lobata
Achillea aurea	Phyllidius capensis
Lilium fasciculatum	Crucianella stylisa
album	Callardia grandiflora
Eurothera Fraserii	Tritoma aurea
Coreopsis tinctoria	Anemone italica
Polygonum Sieboldii	Eurothera macrocarpa
Oxalis Bowieana	Zauschneria californica
Tunica Saxifraga	Coreopsis lanceolata
Tritoma in variety	Stelia mexicana
Crocus in variety	Ethionema saxatile
Colchicum ditto	Potentilla Hepwoodiana
Sternbergia lutea	Verbena venosa
Galatella cana	Plumbago Larpetae
Erodium hemesodes	Amaranthus in variety
Erythrina Crista-galli	Aconitum autumnale
Sweet Peas	Salvia patens
Alströméria pistacina	Polygonum Braunii
Eupatorium purpureum	Linum narbonneuse

—T.

STRAWBERRY CULTURE.

I WRITE a few more remarks on Strawberries, as one of your correspondents wishes to know as much as possible about them. I will begin at the beginning of my gardening career, and be as brief as possible.

Forty-seven years ago I used to gather the Strawberries, &c., at Carriden, the seat of Admiral Sir J. Hope, and the sorts grown were Grove End, Scarlet Rose, and Hautbois, and a few years after that Keens' Seedling came out, and it has stood its ground in spite of other newer sorts. Mr. Shearer, gardener to the Marquis of Tweedale, Yester, is a great Strawberry-grower, or rather the soil, &c., is well adapted for them, and he grows Keens' Seedling, Sir Harry, Elton, and British Queen. The best of British Queens I ever saw grew there. I was at Eglington Castle this year, and Mr. Gray, the gardener, told me that President is a first-rate variety, is better than Eclipse, and succeeds Keens' Seedling. When I was gardener at Castle-martyr, Ireland, I gathered Black Prince on June 10th, but it grew on a south border. This sort will only do one season: if planted in April it may be cleared off for Broccoli by the middle of June. In this quarter Keens' Seedling is ready about June 25th, but on sloping sunny banks it comes in by the 10th. Where the soil is very light a good dressing of manure put over it, and a dose of water in very dry weather, will make up to some extent for the want of heavy soil; but if this is not done the fruit will not be good, and the plants are sure to die. The Elton is by far the best for jam purposes, being a little tart. I hope some good sort eight days earlier than Keens' Seedling will turn up. There is a new sort (Duke of Edinburgh) raised at Forde Dean, and the owner told me it is very good.—*JOHN ADDISON, Ormiston, Tenant, N.B.*

A DISTRESSING CASE.—We regret to hear that the son of the late Mr. William Barnes, of Camberwell, has become so mentally afflicted as to be a hopeless lunatic, and is now an inmate of the Surrey Lunatic Asylum. In this state be leaves

a wife and four young children entirely dependant on his mother, a widow, who is little able to bear so great a responsibility. A subscription is in course of formation to render the needful aid; and when we state that it is in the hands of Mr. Parker of Tooting, Mr. Fraser of Lea Bridge Road, Mr. Maller of Lewisham, Mr. Kinghorn of Richmond, and Messrs. Barr and Sagden of Covent Garden, we have a sufficient guarantee of the urgency of the case, and of the safety with which the fund will be applied. We hope that all who knew and respected the late Mr. W. Barnes will extend their sympathy to his distressed family.

WASTED VEGETABLES.

MEDICAL men have of late been urging upon us that here in England we depend too much upon bread and Potatoes to the exclusion of other vegetables, and that a more liberal vegetable diet would tend to improve health, and to the prevention of many skin diseases and scorbutic affections from which our working population especially suffer. This is undoubtedly true, and it is not from ignorance of such that we continue to suffer, but from inability to procure vegetable diet. Most people in the upper and middle classes of society have vegetables at command, but the substratum have not the means to purchase them, and unless they are fortunate enough to rent a small patch of garden ground, are, except at occasional times, constrained to do without them. Even in country markets, Cabbages, Cauliflowers, French Beans, Vegetable Marrows, &c., are sold at so much higher rates than are Potatoes, that working men's wives rarely think of purchasing them; yet here in England thousands of tons of vegetables, the produce of gentlemen's gardens, are annually consigned to the midden-stead. And for what reason? Simply because it is considered *infra dig.* for a gentleman to barter the produce of his gardens. These tons of vegetables are just what the people need to keep them in health. In place of flinging surplus vegetables on the rubbish heap, let them be sent to the greengrocer or the huckster. They will not sensibly depreciate the receipts of market gardeners, yet transforming vegetables from exceptional to general articles of diet will promote the health and consequent well-being of the nation at large.—*BETA.*

ALKALI FOR AN OLD APPLE TREE.

In considering the growth of organisms, the action of the alkalis is to be looked upon as scarcely less important than that of air and water. Lime is the great animal alkali, and potash the vegetable one; its old name of vegetable kali expressed that fact, and all the potash of commerce is well known to be derived from wood ashes. The importance of potash as a manure has been frequently overlooked by farmers, who rarely know the large amount of this material found in grass, grain crops, leaves, barnyard manure, roots, and fruits. How potash acts in plants, in conjunction with carbon and silex, to form woody fibre, starch, sugar, and oil, is yet unknown to chemical observers, but the fact of its action is beyond a doubt.

Liebig long since pointed out that the chief cause of barrenness is the waste of potash carried off by rich crops, especially tobacco, with no replacement by proper manure. How many millions of pounds of potash have been sent to Europe from the forests of America, and in the grain, tobacco, and hemp! Luckily one alkali may be replaced by another, and we have received a considerable quantity of soda from European seaweed, and in the shape of salt. Latterly, nitrate of soda from natural deposits in South America is brought to us at a cheap price.

The point to which we now call attention is that our farmers and fruit-growers have ignored, or rather have been ignorant of, the importance of wood ashes as a vegetable stimulant, and as the leading constituent of plants. Even coal ashes, now thrown away as useless, have been shown both by experiment and analysis to possess a fair share of alkaline value. According to our observation, if the practice of putting a mixture of wood and coal ashes around the stems of fruit trees and Vines, particularly early in the spring, were followed as a general rule, our crops of Apples, Grapes, Peaches, &c., would be greatly benefited in both quality and quantity, and the trees and Vines would last longer. We will relate only one experiment.

Some twenty-five years ago we treated an old hollow Pippin Apple tree as follows:—The hollow, to the height of 8 feet, was

filled and rammed with a compost of wood ashes, garden mould, and a little waste lime (carbonate). The filling was securely fastened in by boards. The next year the crop of sound fruit was sixteen bushels from an old shell of a tree that had borne nothing of any account for some time. But the strangest part was what followed. For seventeen years after filling, the old Pippin tree continued to flourish and bear well.—(*Scientific American*)

THE EDELWEISS.

THIS, like too many others, has had various names bestowed upon it by botanists. It is now usually mentioned as *Leontopodium vulgare*, but it has also been included by previous authorities in one or other of the genera *Gnaphalium*, *Antennaria*, and *Filago*.

This plant is a native of the highest mountains of the Alps and Pyrenees, and there on their least accessible summits, consequently it has been more coveted than it would have been if easily obtainable. One lady was found dead by specimens of this plant which she had succeeded in reaching. Probably it will cease to be so adventurously sought for since the following have appeared in the daily papers:—

"I write to assure those of your readers that covet the possession of the plant, that it can be most easily grown in England, and requires no special care. In July, 1873, I was at St. Moritz, in the Engadine, and had a small plant given to me that came, I believe, from the Fex glacier. It was quite ten days before I arrived in England, and I carried my plant, with some other alpine roots, in a small basket, watering them occasionally; but had not time to take them out of the basket till I reached home. The leaves of the Edelweiss died down in the winter, and I left it in the pot I brought it in, thinking the root had died too. But in the spring I planted it in a flower border; it speedily revived, and has grown into a large healthy plant. I picked one perfect bloom off it, much finer than I had seen before."

The Rev. H. Smelt, Wilcott Vicarage, Marlborough, states the following particulars of a specimen of this plant now growing in the garden of that vicarage, at a height by Ordnance Survey of only 423 feet above the level of the sea. "The Edelweiss in question was brought from Lucerne in the summer of 1872; it was carried for three days in paper (the little ball of peaty earth nearly dry), in a hat-box to Frankfort-on-Main, where it was potted by a German gardener in German peat, in about the same sized pot as that known to English gardeners as No. 60, after which it had another five days with but very little water in the same hat-box to this place. On arrival it was immediately planted in the open ground. During the winter (1872-73), whenever snow could be obtained it was carefully heaped upon it, and in the following summer I was rewarded with one large perfect bloom. Being allowed, however, to remain too long, it lost its proper shape of a star, and grew into three very irregular asterisks of white felt. This year the very dry cold spring and hot burning summer have agreed with it so well that it produced eleven splendid blooms, standing in nearly a circle round the plant. These were

allowed to open well, and were gathered in June, except one, left, if possible, to seed. The plant is very healthy, but I doubt if, even now, the roots extend beyond the German peat. Every tale has its moral. The moral of this is that, instead of searching for Edelweiss from 7000 to 10,000 feet above the sea, people may find it at 423 feet, and, for aught I know, lower; and, instead of breaking their limbs and bruising their persons on the rugged Alps, they may, if they like, walk across their own English lawns and pick it. I imagine, however, that this will go the way of most morals to tales. It is the spice of danger which makes it *edel*—noble—and urges men and women to try and get it."

Leontopodium vulgare belongs to the Natural Order Compositae (*Antennariaceae*), and the *Syngeneia* *Polygamia enperflua* of Linnaeus. The name *Leontopodium*, literally "The Lion's Foot," refers to the soft tufted heads of flowers. Its botanical character is founded on the same. Flower-head terminal, enveloped in woolly bracts.

It is single-stemmed, with leaves linear-lanceolate in form, and downy on their under side. The flowers are stalkless at the summit of the stem; they are white with yellow centres, and encircled by hairy calyxes and cottony bracts. The entire plant has a grey appearance.

Fig. 110.—EDELWEISS (*LEONTOPodium vulgare*).

IRON SASHBARS.

IN answer to an inquiry in THE JOURNAL OF HORTICULTURE, page 217, as to iron sash-bars, a greenhouse and vinery with cast-iron framework and bars, which has been long under my observation, has the disadvantage of requiring paint oftener than wood; and when this essential is neglected any drip from the iron on the plants is injurious. I am not aware of any other objection.

The late Mr. Errington many years ago, showing me over the houses under his care, one of which was constructed with copper bars, observed to me that he found nothing beat wood for such purposes.—V.

STRAWBERRY FOR LIGHT SOILS.

I AM glad to observe that Mr. Taylor so conclusively confirms what I ventured to advance some time ago, and now reiterate, that President is the most useful light-soil Strawberry in cultivation. On a light soil I can get double the quantity as compared to any other kind, and of excellent quality. It is my standard variety, and like Mr. Addison with Lynn's Black-eyed Marrow Pea, "I mean to stick to it." But on heavy soil it is another thing. Visitors who have seen the crop, and taken runners and planted them on strong soil, have been disappointed. On such soils it is evidently not at home. In a fine Strawberry garden I saw a long line of President, and did not know it. "Why," said the gardener, "they are the very plants you gave me." It was a row about 30 yards long, and I am quite certain that at the same time, with some of the same aged—that is, one-year runners, I had double the quantity of fruit on rows one-third the length; his being in fact almost barren, mine being literally laden with fine produce. The change was so marvellous that I hardly dare mention it, but now Mr. Taylor gives a parallel example, and has drawn it out.

In July I planted runners of President, Sir J. Paxton, Vicomtesse Héricart de Thury, and Dr. Hogg. President has already taken the lead; its crowns are finer, and the crop will be larger than the rest. They are planted in triangles of a 6-inch base, with a clear distance of 2 feet from clump to clump. Next June they will have all the appearance of two-year-old stools, bearing a heavy crop of fine fruit. The year following the produce will be more numerous but smaller, and as soon as it is gathered the plants will be cleared off. By planting annually and removing biennially I can get more and better fruit than by any other way, using President as the staple crop. With heavy ground I should certainly not rely on President, neither could I get such good crops with any kind by one year's runners.—J. WRIGHT.

GIVE AWAY YOUR SPARE PLANTS.

At this season many plants in gardens, both large and small, are dug-up and thrown out. In the garden here (Ramornie) some thousands of bedding Geraniums, &c., are annually thrown out; those for next season being propagated by cuttings. This year intimation was sent to a number of schools in the neighbourhood that, in order to encourage a love of flowers among the young, any scholar coming to the garden between 5 and 6 p.m. would receive a present of two Geranium plants. Some hundreds of children have come, and have been made happy by getting two plants for their own, to watch and care for. I write these few lines in order to suggest to others a pleasant way of disposing of their surplus stock.—A LOVER OF CHILDREN.

PROLONGING THE BEAUTY OF CUT FLOWERS.

FULL of this subject, we happened to mention it to an "old lady," who "had sailed her east and sailed her west," and immediately on hearing it she used the usual interjection, "La—that is simple enough! When I was on the Continent many years ago I noticed a French housewife filling a vessel with boiling water and immediately plunge some faded cut flowers therein. Curious to get the reason, I made inquiries of the woman why she used hot water. Her reply was, 'Why, they last much longer, madame.' We thanked the "old lady" for her information, and at once proceeded to make the experiment. We therefore cut the following flowers:—*Salvia patens*, *Mignonette*, *Stocks*, *Asters*, *Petunias*, *Roses*, *Tagetes pumila*, *Calceolarias*, *Pentstemons*, and *Phloxes* of sorts, and placed them on a garden seat fully exposed to the sun during one of the hottest days of the past July. The following day they were taken, looking withered and almost dead, and plunged (the stems) into a quantity of boiling water. In a few minutes the effect was wonderful; the stems stiffened, the flowers opened, and the leaves became healthy-looking and wax-like in appearance. They lasted much longer than we expected; for after ten days had fled they were as fresh-looking as ever.—S.

VINE GRAFTING.

LAST year I gave an account in this Journal of the effects of grafting a Madresfield Court Vine on a Black Hamburgh. Both Vines are in the same position as last year—i.e., the Madresfield Court is in a large tub, and the Black Hamburgh in a pot. The Madresfield Court is grafted on to the Black Hamburgh, the ends of both Vines being allowed to grow beyond the graft. The berries of the Madresfield Court are, again, round, or rather spherical, and with but very little Muscat flavour. This autumn Mr. Thornton, of the Heatherside Nurseries, has seen these Vines twice, and has made the following suggestion as to the cause—that, as the Madresfield Court is a sport, and the Black Hamburgh probably a true type, the sap of the Madresfield Court as it passes through the Black Hamburgh undergoes a change, and as it returns to the Madresfield Court carries with it the properties of the Black Hamburgh; which, if it is the case, may lead to further discoveries in plant culture. The leaves of the Madresfield Court, however, have undergone no change either in shape, or, when mature, in colour.—OBSERVER.

A VETERAN ROSE-GROWER.—At the recent meeting of the Royal Isle of Wight Horticultural Society, the first premium for Roses was awarded to Mr. Edward Meehan, who for nearly forty years has had charge of the gardens and grounds of St.

Clare. During this time he has been one of the leading exhibitors in the above Society, and, though the competition has been often severe, he has, with few exceptions, taken the first premiums for Roses as a regular thing. We think this feat probably unequalled by anything in the annals of competition. To take a premium for the same thing—and several a season—annually for a period approaching forty years, ought to entitle one to a life interest in it.

CARCLEW, CORNWALL.—No. 1.

THE RESIDENCE OF COLONEL TREMAYNE.

CORNWALL presents a greater extent of coast line than any other county, for, stretching as it does to the west a distance of quite eighty miles in a straight line, until its extremity may be regarded as a point, it has the sea on both its northern and southern sides; and it has also the peculiarity of being joined by only one other county in England, Devonshire. Apart from the sinuosities of its coast line, on the south side it is much broken into creeks or inlets of the sea, or, if the reader will have it so, small tidal rivers, which carry salt water a considerable way inland. These are so numerous that sea views, or views of tidal rivers, are so common that most places of note along the south coast possess one. The large and noble estuary of the Tamar at Plymouth, dividing the two counties of Devon and Cornwall, has its counterpart at Falmouth, whose noble harbour has been long regarded as one of the most important in the kingdom, while between the two are many creeks or inlets, too small, it is true, to admit the larger class of commercial craft of the present day, but sufficiently capacious to give an interest and importance to the landscape; besides which the bluff rocky shore, defying in many places the landing of an hostile army, has also its beauties, and when we call to mind the many substances of which that natural bulwark is composed, we may pause and wonder at the natural riches so closely heaped together in this remote corner of our island, and at the same time not feel surprised at the early nations of the earth making their way thither for its mineral wealth.

But setting aside its early or even more recent history, Cornwall has at all times been famed for the mildness of its climate in winter, and, consequently, its suitability for the cultivation outdoors of many species of plants too delicate to stand outside elsewhere. But as if a sort of counterbalancing agent withheld the ideal of perfection from each and every place, Cornwall has also its drawbacks in the shape of high and destructive winds—winds of a kind that punish with great severity everything that erects itself above the level of neighbouring objects, as, for instance, a tall-growing Silver Fir or Douglas Pine that aspires to overtop the Oaks by which its lower extremities are sheltered or surrounded, is sure to have its head unmercifully dealt with whenever it shows a few feet above them, besides which high winds are so common that their violence is even felt in the flower garden, and sad results often follow. But there are features about Cornwall which cannot fail to interest the horticulturist. He sees there trees, shrubs, and even dwarf plants often withstand the winter, which elsewhere in England are carefully kept under glass, while certain classes of plants which continue their growth late in the season, never fairly go to rest, which is much to their detriment, and I was told some kinds of ordinary herbaceous plants had their growing period prolonged so much that the usual rest Nature intended them to have not being forthcoming, a sickly growth ending in death was often the result. Nevertheless, there are many things to admire in Cornwall, both in its natural characteristics and in the advantage that has so often been taken by wealthy individuals to turn them to good account. Many of such places are of recent growth; others present a more ancient aspect; and some carry a history of their own backwards to a remote period. Such a place is the one now under consideration.

Carclew, the residence of Col. Tremayne, was of considerable importance in the early part of the century, but to trace its history further back, we may say Carclew is in the parish of Perran-ar-worthal, near the south coast. St. Perran was the most distinguished of the Irish missionaries who converted the people of Cornwall to the Christian faith. He finally resided and died at another locality in the county, also named after him—Perran Tabuloe. Arworthal means "the celebrated river." Carclew in early records is spelt Cruglew, which is literally "an enclosure of mounds or barrows."

The earliest-named possessor of Carclew was Dangeros, a

Norman, and from his co-heiresses it passed to David Rendantin, in the reign of Henry IV., the Bonithons, and Heales. Jane Heale, by marriage, brought the estate to Samuel Kempe, Esq., of Penryn, who commenced erecting the mansion, but died in 1728 before it was completed. In 1749 Carelew was purchased by one of the Lemon family, and descended to Sir William Lemon, Bart., who died in 1824. He greatly improved Carelew, and through one of his daughters it passed to the present possessor.

The approach to Carelew from the Perranwell station on the Falmouth Branch of the West Cornwall line of railway is first through some two miles or more of excellent roads, for I may say the best possible material for road-making abounds in this county—granite, which is largely dug but only a short way from where we now are, and its presence in such abundance tells importantly on the character of the county, for it forms the ordinary building stone, more or less mixed with a bastard variety found in connection with it,

and easier to work; but it is a common thing to see pillars of granite set up as ordinary gate-posts to the fields, and stiles and stepping-stones are invariably of this material. But it is not the only rock which is met with about here; railway cuttings and other excavations reveal quartz in greater or less abundance, with slate of different degrees of hardness, but much of it too soft for anything but for ordinary walls; while other substances having local names abound, the surface soil in many instances not presenting the most fertile look; but aided by fertilisers, and, what is more, assisted by a climate perhaps the most genial that can be found in so northern a latitude, things attain a good growth, and such as do not require the period of rest above alluded to are often kept in a growing state all winter. This is especially the case with certain kinds of vegetables and other plants of a similar growth; and it is just the home for all winter and early spring-flowering shrubs, as well as for the whole family of Ferns, to which the abundance of moisture is particularly welcome;

Fig. 111.—CARELEW.

but we will now endeavour to describe the place and its surroundings.

The mansion of Carelew occupies a slightly elevated position in a much-diversified park, the major part of which is profusely interspersed with trees. Its external appearance presents an aspect of durability such as few places of a like kind can boast of, granite of the hardest being used in the building, and the steps, pillars, and other objects are of the same durable material. The carriage-road, after entering a neat and commodious lodge, makes a considerable *détour* to the left in order to avoid the high ground that would intervene if a straight line were attempted, and first passes through a considerable distance of park plentifully sprinkled with trees, more especially the eminences, which, being mostly clad with Oak, give an impression in the far distance of some gigantic Fern occupying the site, the tint being much the same; and although the trees are large, most of them such as a shipbuilder would be glad to get hold of, yet the tops are as even as if by some magical hand they had been clipped to the same height from the surface, thus showing, as my worthy cicerone informed me, that the winds destroyed everything attempting a higher altitude than its neighbour. I have mentioned Oaks as the prevailing trees, but at Carelew there are some fine groups of splendid

old Scotch Firs. Many of them would compete favourably with much that is imported in point of size; notably so in one or more avenues by the side of the carriage-road of this, perhaps, still the best of all our Conifers. But we proceed along an excellent carriage-road composed, not of heterogeneous gravel, but of pure quartz, broken into the required size alike for comfort in walking and to allow wheel carriages; in fact, I may say the roads in Cornwall which came under my observation were all remarkably good, although I fear I cannot say the same of its railways, or rather their management.

But we are approaching Carelew, and passing another gate enter a portion of the ground partly dressed and abounding in fine trees, common and choice Rhododendrons, and the many et-cetera which an enthusiastic owner planted at a time when horticulture was not so fashionable a pursuit. All honour, therefore, to Sir Charles Lemon, whose name as a patron of gardening stood very high the first quarter of the present century, and subsequently until his death, when the property fell into the possession of its present spirited proprietor, who, in addition to being well versed in the knowledge of the plants cultivated indoors, is likewise equally at home with those outdoors, and neglects nothing likely to conduce to their welfare, or to keep up the dignity of the place by judicious

addition. The carriage-road I have alluded to, after some gentle and easy curves, is carried along by the side of a piece of water, on the opposite side of which Ferns luxuriate as Ferns only do in Cornwall, and a water-wheel for the purpose of supplying the mansion and offices with water adds to rather than detracts from the scene before us, while ever and anon the eye is arrested by a fine Douglas Fir. This might possibly in time rival those in Western America were it not for the mischievous Cornish winds. But we pass on, and leaving some of the offices to the right, find ourselves confronted by a noble mass of Ferns, in which many of those elsewhere grown under glass were here luxuriating in great abundance. Notable as one of the most conspicuous, and said to be still more so at Christmas, was the dark-leaved Magellan Fern (*Lomaria magellanica*), which I was told was exceedingly fine in midwinter. *Dicksonia antarctica* and *Woodwardia elegans* were also amongst the outsiders, as well as many others, the space being large. A peep over the fencing at this place also revealed some magnificent specimens of *Hydrangeas* in the front garden of the Agent's house, and, contrary to my expectation, they were mostly pink, or with only a small proportion of blue ones; and although I subsequently met with many of the brightest azure colour, the idea that all *Hydrangeas* in Cornwall are blue is an erroneous one.

But our way is still onward, and passing through the shade of some noble trees of various kinds, the mansion is before us, the carriage entrance being open to the park, as is often the case. The general aspect of the house is Grecian. There is a noble portico with a glass door on the other side, which carries the eye of the visitor right through to a court or flower garden. A broad walk pointing in the direction we have been looking is bordered on each side by a set of circular beds edged with Box, with paths of equal widths between them of coloured gravel, the whole forming a series of the letter S, or what in gardening phrase is often called the Florentine chain; a good margin of grass flanked the figures, the whole being enclosed in a *Laurustinus* hedge, cut, not to shape, but to some condition of order. I was told that without such a screen as this flowers could not exist in such a place owing to the winds, the bulk of the flower garden being in another place. We emerge out of this enclosure, and by a circuitous route pass many noble trees, the private chapel of the family, and get some charming views of the distant country, while a tidal river runs between, which at the time of high water is very interesting, rich and healthy foliage fringing it to the very edge; from another place the position of Penryn is pointed out at no great distance, and the more modern Falmouth a little beyond. Many of these old names conjure up ideas of this county's importance at a time when the present busy hives of industry had not made themselves a name, for it may be mentioned here that of so much consequence was the county at one time, that as many as twenty of its boroughs sent two members of Parliament each, this ancient town, with its narrow and precipitous streets, being one.

Following our intelligent leader, Mr. Palmer, the able gardener at this place, we find we have been making a circuit of the mansion and its adjuncts, and returning near to the front of the dwelling occupied by the Agent, we find we are in the immediate vicinity of the gardens. First of all we enter upon one of the two terraces which compose the flower garden proper, and here we pause and look around us; a cursory view will inform us that we are on the side of a gentle incline, which at a time when the formal flower garden was the rule of the day, had been made into two terraces, both being surrounded by substantial stone walls, low in the case of the one between them, and also the front of all, while the ends are somewhat higher, but not so high as the back one of all, which, with other accessories, acts as a shelter. A basin fountain occupies the centre of one, if not both, of the parallelograms, with ample flights of steps between and leading out of these. The whole of the wall is of the ever-prevailing "granite," and although it has been built most likely half a century, its appearance is still good—certainly more so than the whitewashed plaster objects we often see in a similar position elsewhere. We are soon absorbed in the contents of the beds, or rather in their surroundings, for we have seen so much of the fashionable gardening of the present age that we turn with something like relief to any departure from the beaten track, and here we find Mr. Palmer has judiciously worked-in everything hardy that could with advantage be used. A fine glaucous *Sedum*, superior to the ordinary *S. glaucum*, was so employed; while its *confrère*

Echeveria secunda glauca was said to be all but hardy here, only succumbing in very severe winters. Golden Thyme was also so used, and an *Ajuga* was brought into requisition; while perhaps the most ornamental plant of all at the time of my visit was the dark-leaved tall *Lobelia* called, I believe, *L. St. Clair*, very fine crimson. There were also good purple ones elsewhere, while I was pleased to see the *Calceolaria* quite itself in Cornwall. Of course *Geraniums* of the usual class were duly represented, and a very pretty carpet bed formed the centre of one of the gardens, in which Golden Feather, *Alternanthera*, and other low-growing plants did their part; but, inquisitive like, I looked over the wall, and partly over it and partly upon it was one of the most magnificent *Pampas Grasses* I ever met with, which was just showing its plumes; but what made it more remarkable was the fact of its ripening its seeds and their sowing themselves, and coming up in all manner of places, some on the gravel walks, and some in the interstices between the stones of the wall, although the latter was very closely jointed. Mr. Palmer told me he had planted many of those self-sown plants out, and they did very well.—J. ROBSON.

NOTES AND GLEANINGS.

THE want has long been felt of a common centre for all who are interested in horticulture, and various suggestions have from time to time been made on the subject. We are glad to find that at last something is likely to be effected. A new Club, which will most probably be called "the London," is contemplated. It will be located in some central position near Charing Cross, and will afford its members the facilities and conveniences of a west-end club. Matters are so far advanced that several gentlemen well known in the horticultural world have consented to act on the Council, and a meeting to determine rules, &c., will shortly be held. The probable subscription to country members will be two guineas, to town members something more. After the first hundred names are enrolled there will be an entrance fee. Gentlemen wishing to give in their names can do so at once to the following members of the Council—Rev. S. R. Hole, Cauntton Manor, Newark; Dr. Masters, *Gardeners' Chronicle*; Dr. Hogg, *Journal of Horticulture*; Mr. Harry J. Veitch, Chelsea; W. A. Lindsay, Esq., Royal Horticultural Society; Mr. James Cutbush, Highgate; Sir Edward Lee, Alexandra Palace; Thomas Laxton, Esq., Stamford; Mr. Charles Turner, Slough; or to the Rev. H. Honeywood Dombrain, Sec., Westwell Vicarage, Ashford, Kent.

— It is stated in an American paper that a chalk mark, at least half an inch in breadth, around the upper edge of a sugar bucket, barrel, or other vessel will exclude ANTS from the interior, as these pests cannot pass the bar. It is equally effectual along the edges of shelves. Those who are troubled by ants can easily try this mode, and we shall be obliged by their informing us of the result.

— MR. JOHN HORNE, of the Botanic Garden, Mauritius, who is now on a botanical expedition in the Seychelles, writing to Dr. Hooker, says that he has visited the islands of Silhouette, Praslin, and Félicité, searching them from the seashore to the tops of the highest hills, in Silhouette up to 2200 feet, at which elevation *PITCHER-PLANTS* abound, hanging in immense clusters over every stone, bush, and tree. Flowers of these *Nepenthes* were obtained, and arrangements made for procuring a good supply of plants. When these materials come to hand it will be seen whether the *Nepenthes* of Silhouette is different from the *N. Wardii* which grows in Mahé. The tops of these mountains where the *Pitchers* grow have a perpetual moisture hanging over them, being almost constantly enveloped by mist and rain.—(*Nature*.)

— According to the *Belgique Horticole*, Dr. Candèzi has invented a small photographic apparatus, which he calls a "SCENOGRAPH," which consists simply of a stick and of a camera the size of an opera-glass. To photograph a plant or other object, it is sufficient to place it in the focus of the scenograph for a minute or two. The negatives, it appears, can be purchased ready prepared.

— VERY few people are aware of the immense extent of land occupied by *VINEYARDS* in France, Spain, Germany, and elsewhere. The following statement made by a correspondent of the *Times* will give some idea of the extent of its Vine-growths:—"This is a season when the thoughts of millions of Frenchmen are fixed upon the vintage—a subject of immense importance in this great wine-growing country, the wealth and prosperity of which depend so largely on the results of the

Grape harvest. France may well be proud of its vineyards; in quantity, quality, and variety it is the queen of wine-producing countries. 'From the plains of Champagne to the slopes of the Bordelais,' the *Economiste Français* lately exultingly exclaimed, 'from the banks of the Loire to those of the Rhône, our beautiful sun gilds with its rays upwards of two millions of hectares of Vines, affording occupation to more than seven millions of labourers, and producing as much as seventy millions of hectolitres.' This is admitted to be a maximum, which has only once been attained, in the year 1869. The years 1847 to 1857 formed an exceptional series, of which the earlier years produced some of the finest vintages then known, while in the later ones the oidium played havoc with the Vine. The product in 1851 was less than eleven millions of hectolitres (the hectolitre is twenty-two gallons), and in 1855 little more than fifteen. The eleven years from 1863 to 1873 yielded 592 millions of hectolitres, an annual average of fifty-three millions; and even 1870, in spite of the war and occupation, attained that quantity. The worst vintage of that period was in 1873—less than thirty-six millions; but it seems probable that 1874 will compensate in great measure for that large deficiency. The Vine covers more than 4½ per cent. of the surface of France, of which only ten départements produce no wine. The number of proprietors of vineyards, according to the last census of which I find a record, was upwards of two millions in 1829. There is no important difference in the extent of vineyards in 1851 and at the present day, and the fluctuations during that interval have been trifling. The smallest surface planted with Vines during those twenty years was in 1870, when it was only just over two millions of hectares, whereas in some of the previous years it had ranged as high as 2,300,000. A hectare nearly equals 2½ English acres, so that there have been sometimes 5,750,000 acres occupied as vineyards.

— The opening of the School of Horticulture at Versailles, which was to have taken place on October 1st, is postponed till December 1st.—(Nature.)

NOTES ON VILLA AND SUBURBAN GARDENING.

THE frosts that succeeded the rain on the 21st inst. have very much altered the appearance of the flower garden, for while Dahlias, Cannas, and many other plants of large growth and foliage have been blown to pieces, the most tender of the dwarf-growing bedding plants have been cut down by frost, notwithstanding that most of the Geraniums have escaped injury, and may yet be induced to put on a brighter appearance. The dislike of most people to seeing the beds made bare so early in the season, will induce them to give another dressing and trim the plants up once more, and if frost keep away the beds will look much better than the naked earth. Where Dahlias are much broken about the branches had better be cut off, and those remaining should be fresh tied-up. I am not an advocate for taking up either Dahlias or Cannas too soon; the middle of next month is quite soon enough; the roots become better matured. But if severe frost should cut down the tops to the ground before that time, protect the roots by coal ashes; or if these are not to be had, throw a few inches deep of the garden soil over them. Make sure now without delay that all the cuttings of every sort wanted have been obtained, and if any stock is likely to fall short of what will be wanted, either propagate more or take-up the old plants before it is too late.

Verbenas in frames are liable to the attacks of mildew at this time of the year; immediately it is discovered dust the leaves with powdered sulphur. I generally keep my stock of these plants in the cold frames all winter, together with *Calceolarias*, variegated *Alyssums*, *Gnaphaliums*, and *Pansies*. The frames are stood upon a dry bottom and filled half full of some rough material, then coal ashes are placed on the top of these, the pots put on the ashes, and, of course, every opportunity is taken to give all the air possible, and several times during winter the pots are taken out, and both these and the plants cleaned if needed. Plenty of air circulating among the pots, and not standing them closely together, are good means of keeping away mildew, and my plants in spring cause much less trouble. Being very short of house room, I find this method of great advantage. All the other plants named above are not kept in pots, but the bed is made-up inside the frames to within 8 inches of the glass, with 2 inches of finely-sifted sandy soil on the top of other rougher material. The cuttings are dibbled into this about 2 inches apart and made firm, watered, and kept close for a time. They are never allowed to flag from the sun heat. If they show signs of dryness in the leaf the lights are thrown off in the morning and the cuttings sprinkled with water. This keeps them so fresh that they are not long before they take root.

My cuttings of *Calceolarias* have only just been put in. I always defer the work as long as possible, and feel myself satisfied if they are rooted by about Christmas. Now, as these plants are kept in the frames all winter, there is need of protection to exclude frost. This is done by what in the London nurseries is called banking-up. A lining of rough dung, or dung and earth together, is laid firmly round for about 18 inches in width, reaching to the top of the frame; it would require a very severe frost to get through that thickness. Then the glass is protected by mats, and on these is laid a little dry straw or rough clean litter, such as may have been used in the stable for one or two nights. Some persons keep the commoner sorts of Geraniums in frames also through the winter, but they should be treated like *Verbenas*—that is, be grown in pots and set on a very dry bottom elevated close to the glass.

Cinerarias are yet doing well in frames, though they will damp-off if not watched; *Primulas* the same, but in a short time they will be taken into the house and placed on a shelf near the glass, where their flowers will soon open. I now come to the herbaceous *Calceolarias*, which are, perhaps, the easiest of anything to preserve in a cool frame or pit during the winter. They grow very fast at this time of the year, and must be potted-up frequently, for if allowed to become pot-bound too soon they turn yellow and start-up a flower-stem prematurely. These plants are comparatively hardy, and I have more than once seen plants with a piece of ice lying in the heart. They will thrive in a rich loam with finely-sifted manure added in the proportion of one part in four, and made workable by adding sand to it.

Strawberries in Pots.—There are many villa gardeners who ought to pay more attention to ripening the plants off a little. I do not mean to dry the plant up so that its leaves shrivel, because that alone would ruin the prospects of a crop of fruit, but the plants should be taken up and the pots placed on a hard bottom of boards, still out of doors; their roots cannot then run through the bottoms of the pots, but the crowns increase in size very much at this time of the year, and the plan of standing them up in the way I mention so far checks their growth as to leave the plant nothing else to do but to mature itself. At no time should Strawberry plants be allowed to become dry at the root; the object should be to preserve the roots fresh as they are made at this time of the year.—THOMAS RECORD.

DOINGS OF THE LAST AND PRESENT WEEKS.

HARDY FRUIT GARDEN.

WE have now had sufficient rain to penetrate to the subsoil, and all fruit trees to be removed should be lifted at once. The trees to be benefited by removal are those which have been planted a few years only, and have a tendency to grow more to wood than to fruit buds. There are also older trees which have the same evil tendency. Almost under any circumstances the same variety of tree has a woody character; of such are Tower of Glamis, Blenheim Pippin, &c., amongst kitchen Apples. Amongst Pears, Plums, and Cherries there are varieties having the same fault. Varieties that have a gross habit may be checked and thrown into fruit-bearing when young by grafting on dwarfing stocks—viz., the Apple on the Paradise, the Pear on the Quince, and the Cherry on *Cerasus Mahaleb*. It will at the same time be necessary to state that many varieties of Pears will not succeed on the Quince until a variety that thrives on it has in the first place been worked on the latter. Gentlemen in the trade know the peculiarity of each tree, and this matter can safely be left in their hands, but amateurs and others who have leisure can often find a source of enjoyment in budding and grafting trees of their own. There are also many varieties of Apples and Pears that are prolific in all soils. Lord Suffield, Cellini, Dumelow's Seedling, Hawthornden, Cox's Pomona, and many of the best dessert Apples are sure croppers, and such only should be planted, especially in small gardens and in positions where the trees are intended to grow large. Lastly, those trees that have shown signs of canker before they have arrived at the meridian of life would often take a new lease of life if their leading roots were brought nearer the surface, and some suitable loam that has not already grown fruit trees were placed amongst the roots. When it is intended either to remove or root-prune a fruit tree, the first operation is to dig a trench round it, taking the radius of a circle at the extremity of the branches, and there digging out a deep trench. The larger the tree, so much the deeper ought this trench to be; from this work under the roots to the centre of the tree, and with a spade cut through all descending roots. If it is intended to replant the tree in another situation the same care is requisite to save all roots that would be immediately useful.

American blight is best attacked at this season. It ought not to have a place in any well-managed garden; it must and can be removed from young trees, but cankerous old subjects that are badly infested are only fit for the fire. Our plan is simply to dress the part affected with boiled oil, which is fatal to the insect. The buds and young wood must not be thickly dressed

with this, otherwise both will suffer. *Scale* on Pear trees may be removed by syringing them with water at 150° in which soft soap has been dissolved; or the water may be obtained in quantity from the laundry. This will not be quite so strong, but it costs nothing except the labour of carrying it to the trees, and a few more applications will be quite as effectual.

As soon as possible we shall look over the wall trees, and any pruning required will be done as soon as possible; afterwards any branches that require nailing will be looked to. Nothing has a more untidy appearance about a kitchen garden than branches hanging loosely from the walls, and the trees unpruned through the winter months. Of course, gardeners are the creatures of circumstances, and cannot do this or that work exactly at the time it ought to be done. At the same time let all pruning be early; the most of ours is performed in summer and autumn, excepting Gooseberry and Currant bushes, which are pruned in mild weather during the winter months. It is not uncommon to see gardeners sent to prune fruit trees and bushes during severe frost, but this is bad management and ought not to be persisted in. All wheeling of manure, &c., and trenching, may be done when the weather is cold.

FRUIT AND FORCING HOUSES.

Vineries.—A sharp look-out is kept for mouldy berries in the late houses; much damage results from just one day's inattention to this particular, the mould spreads so rapidly. The lateral growths were so thick on some of the canes that light and air could not circulate freely amongst the leaves. These have been removed with advantage to the fruit, which is now hanging.

Preparing Early Houses for Forcing.—It would be well if the inside of the houses could be painted every second year. This can seldom be done, but the walls may be linewashed and the hot-water pipes painted at but little expense. One pound of flowers of sulphur may be added to each pailful of the wash. House spiders are a considerable nuisance in vineries; they retire into snug corners during the winter months, and in summer the young ones get into the centre of a bunch of Grapes and work their webs amongst the berries.

Many persons may be making Vine borders preparatory to planting the Vines. We should not like to create unnecessary alarm, but now that the *Phylloxera vastatrix* has become established in the country, it would be well to guard against its introduction into our gardens. Of course, no nurseryman would send out plants with this terrible insect upon them, nor would any gardener knowingly send eyes or plants to his friends if it were in his garden; but by way of precaution, our advice is to turn all plants out of their pots as soon as they are received, wash the soil from the roots, then soak the plants overhead in water for two days. This treatment would not be likely to injure the Vines, and would effectually dispose of the *Phylloxera*. The plants after being taken out of the water might be planted out at once, or, if necessary, be repotted.

We might just allude to *pruning Vines*. The usual method is that called the short-spur system. One, two, or three rods are trained-up from one plant at a distance of not less than 2 feet 6 inches from each other, and the spurs are about 18 inches apart. The side branches are spurred-back to a good eye at pruning time, and under this treatment the same rods will continue in bearing for twenty years or longer. It is not desirable to allow the rods to become so old, as young ones can be gradually trained-up in their place. Some varieties of Vines do not fruit freely if trained on this system. Such are that fine old variety Royal Muscadine, Golden Champion, Canon Hall Muscat, &c. Black Hamburgh, Muscat of Alexandria, Lady Downe's, and Mrs. Pince's Muscat may be spurred-in closely and will bear at every branch. If the shy-bearing varieties are trained on the spur system, the spurs must be left with two or even three good eyes.

Figs.—In most large establishments a house is specially devoted to the culture of this fruit, and we have seen Figs grown in large lean-to's and half-span houses of small size. They do well in either planted out in turfy loam not over-rich. It is best under such circumstances to train them to wires as Vines or Peach trees are trained. We cultivate a few in pots, and grow them in any houses where the foliage can be exposed to the light; the trees will grow freely enough in the shade, and will also bear fruit, but it is of very poor flavour. Grown in heat and exposed to the light near the glass, Figs can be obtained of the most delicious flavour. The potting material should be rich, turfy loam four parts, one part rotted manure, and a few crushed bones added to it. Our trees are now being potted, healthy young trees abundantly furnished with roots are shifted into larger pots than they were in; older trees that have gone to the utmost limit the size of our houses will allow, are shifted into pots of the same size as those in which they had been growing, after the ball of earth and roots has been reduced sufficiently to allow of at least an inch of fresh loam all round the sides of the pot.

Orange trees in pots are now ripening-off the fruit, and it is very desirable to keep the leaves clean. Brown scale has been

troublesome, but after sponging the trees well the enemy has been kept at bay by syringing very freely twice daily.—J. DOUGLAS.

PROVINCIAL HORTICULTURAL EXHIBITIONS.

[SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held. Although we cannot report them fully, we shall readily note anything especially excellent, and we wish for information on such specialities to be sent to us.]

Ewing & Co., Eaton and Cringleford, Norwich.—*Rose Catalogue.—General Nursery Catalogue.*

TO CORRESPONDENTS.

* * All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

GARDENERS' CHRONICLE (A. T. Walters).—We are in no way connected with that paper. The proprietors have added our title to the original one of their own, and it causes the mistakes you mention.

BOOKS (F. B. Turner).—"British Ferns, Popularly Described." You can have it from our office by post if you enclose 3s. 8d. with your address.

GARDENING UNDER DIFFICULTIES (J. E. W.).—The soil of your unfortunate garden need not be changed, an annual dressing of manure being all that is necessary to reinvigorate it for the crop of each successive season. With regard to the necessity for protecting your crops from cats, we must refer you to your own experience of the extent and form of their depredations. Some special notes treating fully upon your case are in preparation.

DEFORMED CUCUMBERS (J. S.).—We believe that crooked Cucumbers and enlarged ends with constricted middles are caused usually by a deficient supply of sap. Fewer fruits on each plant and tepid weak manure water to the roots once a week would probably prevent the deformity. Gunning of the fruit is occasioned in the same way, and by the bottom heat being too low.

AMARANTHUS HENDERSONI.—Messrs. Hender & Son, Bedford Nursery, Plymouth, write to ask if that is not a misnomer. They say that they raised the variety, and if so it certainly ought to be named *Amaranthus Henderi*.

ZONAL GERANIUMS.—"W." says, on p. 337, "Never apply liquid manure to a plant when dry; water it first with clear water. Many hundreds of plants are spoiled by neglect of this little precaution." This is new to me as well as to others. Will "W." therefore, oblige us by stating on what his opinion is based, whether practical observation or theory? If the latter, I should feel obliged by an explanation.—J. HARDIE.

HAZEL NUTS FAILURE (Brb.).—The failure in Westmoreland and Cumberland must have been caused by ungenial weather during the time of fertilisation. In the south of England the Nut crop is very abundant.

CENTAUREA ARGENTEA WINTERING (Dublin).—It will not winter in the open ground, nor safely in a frame unless frost be excluded, and the plants have but little water, giving only sufficient to keep them from flagging.

IVY CUTTINGS—SEEDLING BRIAR STOCKS (H. G. O.).—Ivy cuttings are best put-in in September, or it may be done now in a sheltered shady border in light rich soil, in rows 6 inches apart and 3 inches asunder, two-thirds of their length being inserted in the soil. The cuttings should be about 9 inches long for the free-growing sorts, and 6 inches for the small; select the growths of the current year, which may either be the points or the shoots cut into lengths, cutting transversely below a joint, and removing the leaves, not the eyes, from the base upwards; the cuttings are to be placed in the soil, making the soil moderately firm around them. The seedling Briar stocks are budded just above the setting-on of the roots, close to the soil, budding being of course practised higher up the stem if half-standards or standards are required. The seedlings vary in the time of being fit to bud, but for dwarfs generally in July

of the second year. The practice of striking Rose cuttings in the open ground in autumn is very common, and we think you have been very successful. It is difficult to account for a cutting here and there failing. In addition to the seed and cuttings of Briar we should, if you wish for standards, secure some stocks from the woods.

EUCONYMUS PROPAGATION (Inquirer).—The shrub of which you sent a spray is an *Euconymus*, we think *Euconymus angustifolius*, which may be raised from seed sown now or in spring, sowing in light sandy soil outdoors in a sheltered spot. The seeds you will find in the capsules, which are very beautiful. Cuttings of the ripe young shoots will also root if now inserted in a light soil and sheltered border.

CUTTING ARBOR-VITES (Idem).—They bear cutting well, the best time to do which is at the close of March, or early in April if a cold late spring.

ECHIVERIA METALLICA AND CANNA SOWING (K. K.).—This is not a good time to sow the seed, it being best done in February or early March in a hot-bed, the plants being forwarded in a hot-bed, so as to have them strong and well-hardened-off for planting out early in June.

TRANSPLANTING BRIARS NEWLY CROPPED (W. A. W.).—You may move them in November as safely as if they had grown a year after budding. The Rose briars are infested with black mildew or fungus, due to the dry weather. Free watering and syringing overhead will subdue it.

PROTECTING ROSE CUTTINGS (St. Edmund).—The cuttings in the open ground would be better of a light mulching of cocoa fibre between them, acting, as it would, as a protection against frost. The cuttings you have in pots will need to be shifted into larger ones in spring if your intention be to keep them in pots; and the soil for potting we should now lay up in an open situation out of doors in alternate layers of soil and cow dung, having the soil-layers twice the thickness of the cow dung. In February you may turn over, chop-up and mix the compost, and take it under cover so as to have it in good condition for potting—neither dry nor wet, early in March.

WINTERING BEDDING PLANTS IN FRAMES (Ann Oxford).—See what Mr. Record says this week.

CYCLAMEN CORNS (Mrs. B.).—A cool greenhouse is a most suitable place for them. They need no heat to start them.

GRAPE STEMS DYING (One in Trouble).—The stems of the bunches dying is, we think, a consequence of their having been kept too moist, the soil being also wet, especially now the Grapes are ripe, the footstalk sent having the appearance of those produced by Vines, the growth of which is gross. Less moisture would probably afford a remedy. No alkali added to the water would be of use. Expose it to the weather and it will lose much of its hardness.

GRAPES MILDEWING (A. F., An Old Subscriber).—We do not think your Grapes are attacked by mildew, the spots on the berries being caused by damp, which ends in mould. A gentle fire by day with abundance of air, and no fire at night with a little air, will give you an atmosphere better calculated for keeping the Grapes in good condition. At night it may occasionally be necessary to employ fire heat to exclude frost. The drier you keep the atmosphere the better it will be for keeping the Grapes; but avoid a high temperature—50° is ample by day. It will, of course, be higher from sun. Fumigation with tobacco is of no use for mildew; dusting with flowers of sulphur is the proper remedy, applying it to the infected parts. The plants, as you judge, are not conducive to the Grapes keeping well.

APPLE AND PEAR ESPALIERS CANKERED (Idem).—The best remedy would be to lift the trees carefully in November and give them some fresh and richer soil, making firm. If they are old trees the lifting may not be judicious, in which case we should manure well and point-in with a fork. Is not the knotting on the stem and mildew in it American blight? If so, dress the trees with a composition formed of gas tar and dry powdered clay in equal proportions, say a quart of each, adding by degrees two gallons of warm soft water, so as to give a paint-like consistence, and with this dress the trees, applying with a brush, and rubbing well into the knots and crevices, avoiding the buds, though it does not injure them. Is the soil efficiently drained? If not, it ought to be.

CUCUMBERS NOT SWELLING (J. S.).—From the description you give it is to be feared you have the Cucumber disease, or that form of it which results in the fruit being ulcered and ceasing to swell. The soil is probably a little too rich, and the bottom heat strong. In any case, too much support is impelled into the fruit, which is not duly elaborated. Probably the omission of the manure water and a less temperature by 5° at night, the bottom heat not exceeding 77° would, with a good high day temperature, cause the fruit to swell more kindly. Let the foliage be fully exposed to light, not crowding it, and have a less moist atmosphere than you would were all right. It is likely they will improve; but the whole subject is, as regards remedy, involved in mystery.

FRUIT TREES FOR SIDES OF GREENHOUSE (A Cottage Gardener).—You have three Vines trained to the roof; the covering of the sides or ends, we are not sure which, but one is as good as the other, and wired at 6 inches from the glass, would be suitable for a Peach at one side and a Nectarine on the other, obtaining them with such stems that the lowest branches will originate at the base of the trellis. The trellis ought not to go higher than a foot clear of the Vines. If you have not ventilation at the sides, it is likely the fruit of the Peach and Nectarine may be scant, they being subjects which require free ventilation. An Apricot would not do, but you may have Figs if you have no side ventilation, yet the Peaches will be most profitable. A good Peach is *Grosse Mignonne*, a Nectarine *Eldon*.

TRANSPLANTING LARGE THORNES AND BIRCH (J. W.).—The Thornes are more difficult to move than Birch, but both may be moved safely of the size you name, care being taken to commence removing the soil at not a less distance from the stem than 4 feet all round, and retaining all the roots between it and the stem, and if you can preserve some soil to them all the better. The sooner they are moved after the leaves fall the better chance will be given them, watering well to settle the soil about the roots, planting high rather than deep, and securing them well against winds. The best kind of Birch for shelter is the common one, *Betula alba*, which may be cut as desired.

GRASS UNDER TREES (Rimath).—The *Festuca duriuscula* and *Poa nemoralis* sempervirens should be sown in equal proportions, weight for weight, for the purpose named, or nearly so; 2 lbs. *Festuca duriuscula* and 1 lb. *Poa nemoralis* sempervirens for a rod or 3¼ square yards. It is of no use sowing the seeds unless the surface be loosened, giving a light top-dressing of rich soil, and rolling or beating firm after sowing.

WISTARIA, HAWTHORN, AND HORSE CHESTNUTS (W. D. S.).—The fruits

of the two latter could be obtained anywhere that the trees grow. Of the *Wistaria* we can give no information.

STRAWBERRIES FOR MARKET (Strawberry Hunter).—Black Prince is the earliest and most prolific, but it is rather too small for market-garden purposes; Vicomtesse d'Harcourt de Thury, Sir Charles Napier, and British Queen. The last named is well known, and common is the best price in the market.

BONGIVILLEA CULTURE (E. L.).—*B. glabra* will become almost leafless in winter, and should at that time be kept rather dry; in fact, it should only have water to keep the wood plump; but as your plant has been placed in the greenhouse and kept dry we should remove it to the stove, and only give water to prevent flagging, affording a light and airy position. Continue this treatment throughout the winter, and encourage growth in spring, potting early in May and regulating the shoots as they grow, watering freely up to July, then moderately, and, all going on well, it will flower at the end of August or beginning of September, its usual time; but with us it produces its pink bracts from the point of every vigorous growth. Your plant placed in the stove will probably flower between now and Christmas, and kept dry over winter, started in March after it has been pruned, cutting out the weak growths and shortening the others to firm ripe wood, potting when the shoots are a few inches long, and growing-on up to July, then keeping drier, it will flower in September, and, grown well, is a fine subject. Some of the *Bongivilleas* do not lose their leaves in winter, as *B. spectabilis*, which flowers at that time.

HARDINESS OF PIERIS CRETICA ALBA-LINEATA (J. R. Bough).—In a sheltered nook it is hardy, and will survive out of doors in most positions, but is sometimes injured by frost. If you have not a duplicate, the safest plan would be to take up and pot, keeping in a greenhouse over the winter; but if you have duplicates, take up one or more and leave one or two out, and you will ascertain if it is sufficiently hardy to endure an ordinary winter in your locality.

PIRACANTHA AND PYRUS JAPONICA PROPAGATION (Co. Antrim).—Both are propagated by layers, which should be made at once, cutting a notch at a joint, and about halfway through the shoot on the under side, and securing with a peg at 2 to 3 inches below the surface. Let the layers remain until this time twelvemonth. We do not know what you can do to the *Piracantha* to make it bear berries, but it may be too vigorous, and in a position not favourable for fruiting, being shaded by surrounding objects. If not shaded, taking out a trench at 4 feet from the stem and down below the roots will probably check its vigour; the roots being cut there, fill up again, and you will have berries in time.

HARDY ALPINE PERENNIALS FOR ROCKY BORDER (A. G.).—*Anthyllis eriocoma*, *Draba ciliaris*, *Erysimum pumilum*, *Linum saalsolide*, *Lithospermum Gastoni*, *Saxifraga longifolia* vera, *Alyssum saxatile compactum*, *Cheiranthus longifolius*, *Cistus algarvensis*, *Dianthus alpinus*, *D. neglectus*, *Draba aizoides* (if you have *D. ciliaris* this may be omitted), *Erigeron speciosus*, *Gentiana verna*, *Iberis gibraltarica* vera, *Lychnis Lagasce*, *Nepeta Mussini*, *Oenothera marginata*, *Orobancha vernus*, *Oxytropis uralsensis*, *Saponaria caucasica flore-plena*, *Sedum atropurpureum*, *Silene pumilio*, *Statice latifolia*, *Veronica prostrata*.

BRETTSELS SPROUTS AND OTHER CABBAGEWORTS CLUBBING (J. J. M.).—As your garden for sixteen years has been specially occupied with the various species of *Brassica*, no wonder that they are now club-rooted. As the soil is clayey we should by degrees pare and burn the top spit of the whole; then to those parts apply lime and decayed vegetable matters as your gardener recommends, and avoid growing crops of *Brassicæ* in succession on the same plot.

FORCING SEA-KALE (Leeds).—We know of no preference to be given to stable dung and leaves over stable dung alone for covering the Sea-kale pots. Leaves alone would do as well as either, if you have enough to ensure permanent heat.

LA HATIVE CURRANT (A Fruit-Grower).—You might try a few, but we would not recommend to plant it largely. If your land is in the condition you mention it does not require any bones in the holes where you plant the Currants.

LILAC FLOWER (F. Walker).—It is only one of those premature births to which all flowering plants are liable.

WINTERING BEDDING PLANTS IN HEATED PITS (Beginner in Lancashire).—You will have no difficulty in wintering the *Geraniums* and other plants as you have a 2-inch hot-water pipe round the pits, which will be more than ample to exclude frost. You need not have a higher temperature for the plants than 40° to 45°, and they can hardly have too much air in mild weather, giving only water between now and March to keep them fresh and slowly growing. In March you may shift into larger pots, encouraging growth by free waterings. The *Calceolarias* will winter safely, as also the *Verbenas* along with the *Geraniums*, but the *Calceolarias* and *Verbenas* should have the coolest and most airy part. One pit you ought to keep exclusively for flowering plants in pots, at 1 in addition to bulbs we should have a few plants of *Cyclamen persicum*, *Primulas*, and *Cinerarias* for spring bloom to be followed by herbaceous *Calceolarias*, *Pelargoniums*, *Fuchsias*, and other plants, as *Hydrangeas* and the kinds of zonal and variegated *Geraniums* suitable for pot culture, and a plant or two of *Valloia purpurea* to go in autumn for house decoration. The light summer-house will make an admirable cool house for the *Glaudi* you propose for sarding in pots prior to planting out, also *Tritomas*, whilst it will be useful for hardening-off your bedding *Geraniums* and other plants, transferring them from the pits in March or early in April, thereby setting the pits free for raising plants, and especially annuals for blooming in them in summer, as *Balsams*, *Globe Anemones*, *Cock-scum*s, *Celosias*, &c. Your summer-house will also be a good place for *Chrysanthemums* to bloom in, they being grown outside in summer, and removed to the summer-house when they show for flower, or early in October.

PLANTING A CLUMP OF TREES (A Six-years Subscriber).—*Pinus austriaca*, from its dense growth and the fine effect of a mass of its rich dark glossy foliage, forms a fine clump, and we like to see an occasional Larch among a number of it, the spicily air and bright fresh greenery of the Larch affording a fine relief and contrast to it, especially in spring. The best way would be to plant the whole of the trees 6 feet apart, introducing a quantity of "non-sag" Larches, to be removed as the Pines require space. Copper Birch would not be sufficiently effective in front of the dark Pines, but the Pines would tell well. As the situation is sheltered we would choose the American variety called the Western Pine (*Pinus occidentalis*), which is preferable to the Oriental Pine from the rapidity of its growth. Two or three *Liquidambar* placed at intervals near the margin would impart a picturesque appearance to the clump, especially in autumn, when its leaves change to a vivid crimson mixed with purple and yellow.

Cool-house Orchids (R. P.).—*Mastelvalia Hariyana*, *Odontoglossum Alexandrie*, *Odontoglossum grande*, *Laelia purpurata*. These will succeed admirably in a warm greenhouse or cool stove. During growth they require to be kept moist and shaded from bright sun, sprinkling overhead three times a day, and after growth keep drier, sprinkling once or twice a day, the *Mastelvalia* requiring to be kept moist m-l-t. They should be potted in spring, just before or when commencing to grow, in a compost of rough brown fibrous peat, sphagnum, and crocks in about equal parts, keeping them high in the centre of the pots, the pots to be half filled with crocks, the plants placed on the top of the cone in the centre of the pot, the roots only being covered with the compost.

Applying Lime to Garden (R. F. B.).—Lime will effectually clear the ground of slugs if its application be persisted in, dasting with quicklime at frequent intervals any crops attacked by them. Your garden being badly infested, you may now apply it in dry weather, putting it on in its quick but fallen state, and as soon after as convenient dig it in. We should not at this time of year give more per perch (3½ square yards) than half a bushel, which is equal to a dressing of eighty bushels per acre, but we should supplement it in the first dry weather in March with the same amount per perch, and merely point it in with a fork, following up the dressing with dastings as required to keep down slugs, which may have escaped the dressings, as some in the egg state may have done.

Waterproofing Paper by the Aid of Sulphuric Acid.—“I read an article on the subject in the Journal some months ago, which directed to get diluted acid and add the same bulk of water. I obtained the pure acid, and diluted first two of water to one of acid, increasing the water up to twenty-one, still keeping the one of acid, and dipping a piece of paper in each time; and when all the papers were dry none of them presented at all the appearance of parchment, the last ones scarcely altered. Will someone state what the proportions are?—AN OLD SUBSCRIBER.”

Gas Boiler (A. W. D.).—You may obtain a gas boiler that will heat efficiently 100 to 200 feet of 2-inch pipe; but the size that would heat 100 feet would not heat double the number of feet; a boiler of larger size would be required. For economy in heating by gas, 2-inch pipes are too large, wrought iron 1-inch-bore pipes are better, and four 1-inch only hold the same quantity of water as one 2-inch, and have double the amount of heating surface. We cannot name any boiler in particular. Write to those advertising in our columns.

Red Spider on Neapolitan Violets (C. R. H.).—The best remedy is to form a solution of soft soap, 3 ozs. to a gallon of water, and immerse the leaves one by one in the solution, it being contained in a shallow vessel, as a saucer. This is a tedious process, but it is astonishing what perseverance can accomplish. The worst leaves may be removed. A day or two afterwards give them a thorough syringing with soft water, one peck to thirty gallons, stirring well up before use, and straining so that the syringe may not be clogged by any particles of dirt, and in a week you may dust dry soot over the plants and the whole frame, just a little to make them black. The soot will improve the colour and growth.

Insects Attacking Ferns (H. C. R.).—The insect sent is the male of *Sirex juvenes*, a not uncommon wood-boring fly, the larva of which lives in Fir trees. If your statement is correct, that it differs at different stages of its existence it has eaten your Ferns, the fact is new, and it would be very desirable if you would furnish the details of its history, mode of attack, part of the plants attacked, &c. Its larva is a white fleshy grub.—I. O. W.

Names of Fruit (W. Vincent).—The Pear is Dr. Capron, a worthless variety. (*Seetha*).—1, Royal Russet; 2, Franklin's Golden Pippin; 3, Armato Russet; 4, Beurre d'Arenberg; 5, Colmar d'Arenberg; 6, Glon Moreau. (*J. Green*).—The Pear is Beurre d'Espagn. The Apple we do not know. (*Richard James*).—The Grapes you sent are the true Lady Downe's. We do not see anything particular in them to lead us to think there is something wrong. The new edition of the “Fruit Manual” will be ready in a few weeks, but progress having been made with its passing through the press. (*R. C. Bartlett*).—La Joive. (*A. Subscriber*).—Egno. (*G. Dist*).—1, Beurre de Rance; 2, Beurre de Capiaumont; 3, Aston Town; 4, Beurre d'Id. (*T. E.*).—1, Duc d'Angoulême; 2, Jersey Gravel; 3, Northern Greening. (*R. D. G.*).—1, Kerry Pippin; 2, King of the Pippins; 4, Goscar Pippin; 5, London Pippin; 6, Wykon Pippin; 7, Marquise Pippin. (*W. T.*).—1, Striped Vincoulesse; 2, Dandelion's Seedling; 4, Red Downe; 10, Easter Benger; 11, Passe Colmar. (*A Somerset Subscriber*).—1, Triumphant de Jodogne; 2, Swan's Egg; 3, Cassane; 4, Comte de Lamy; 6, Van Mons Leon Leclerc. (*A. D.*).—1, Nelson Codlin; 2, Claygate Pearmain; 3, Golden Noble; 4, King of the Pippins.

Names of Plants (Lady K.).—1, Thuja Lobbiania; 2, Pinus radiata; 3, Cryptomeria japonica; 4, Thuopsis borealis.

POULTRY, BEE, AND PIGEON CHRONICLE.

BRIGHTON POULTRY SHOW.

(From another Reporter.)

THE third annual Exhibition was held this year at the Royal Pavilion, Brighton, and it is seldom we find a building better adapted for this purpose. This year an addition was made to the schedule in the shape of cats and dogs. The combined entries reached 996; had they been doubled ample accommodation could have been found; the light was also exceedingly good.

Dorkings commenced the list, Mr. Ellis winning with a sound pair, well grown, and short in the leg.

In Dark *Brahmas* Mr. Lingwood had an easy victory with a grand black-breasted cockerel; the pullet was also a fine one, well pencilled, and heavily feathered in the legs. The second-prize pen was very young, but they deserved their position, and we hope to see them again when they are more developed. The Light *Brahma* class was a large one, Mr. Lingwood again winning. The cockerel was indisputably the best, but the second-prize pen contained the best pullet. The third-prize birds were small, but pretty; we could not find a pair to beat them.

The Buff *Cochin* class contained but four entries, but the deficiency in numbers was more than made-up in quality. *Cochins*, any variety, a beautiful pair of Whites were first; the Partridge hen in the second-prize pen was well pencilled; the rest were poor.

Game.—The Reds were a fine class. The first-prize birds were very young, and we thought it a great pity they were shown so soon; a more promising pair of chickens we have not often seen. Pen 77 we liked quite as well as the second and third-prize pens. *Gams*, any variety, were moderate. The Pile hen in the second-prize pen we thought the best bird in the class.

The *Hamburghs* were a beautiful lot. The Duke of Sutherland was awarded the first prize in each class for Silvers, which well deserved their position.

Spanish were only moderate. The difference between the first and second-prize pens was very slight.

In *Polish* Mr. Adkins showed two pairs of magnificent Silvers, which secured the first and second prizes.

The *French* class was not a large one. A fine pair of *Hondans* were deservedly placed first.

The Any variety class contained no novelty, but some good birds were to be found. Black *Hamburghs* were first and second, and a fine pair of *Malays* were third.

Game Bantams.—The Red class contained only a few nice birds. The first-prize cock was very neat, and had a beautiful head; his partner we did not admire. In the *Game Bantam*, any variety, a superb pen of Piles were first, and must have run very closely for the cup, which was awarded to Mr. Leno's *Se-brights* in the next class.

The *Sussex* class was a creditable one, but hardly equal to that of the previous year.

The *Ducks* were very numerous and good, the pair of Blacks that secured the first prize in the Any variety class deserving special notice.

The *Pigeon* classes were well filled, the entries in the *Carrier* class numbering fifty-one. Many of the best of the old birds were far advanced in moult, and the Judge must have had some difficulty in deciding between quality and condition. The young class was a large one. We liked the first-prize bird, but preferred pen 379 to the second; a grand Blue was third. The *Pouter* prizes were all taken by Mr. Vander Meersch, but we thought his third-prize pen the best. The *Barb* class was so good that the majority of the birds were noticed by the Judge. The *Dragoon* class was the largest, and here Mr. Graham secured all the prizes. The *Jacobin* class was small, but very good. Here we thought pen 452 should have been noticed. *Fan-tails* were greatly admired, and we should have liked to have seen pen 459 in the prize list. The other classes were all well supported, the Working Antwerps exerting an unusual amount of interest. The points cup was again won by Mr. Vander Meersch, who, we believe, obtained the same honour at the two previous shows.

The judging of both poultry and Pigeons appears to have given satisfaction, and we congratulate the Manager, Mr. Lenny, upon having found such an admirable place for a show, and for the energy and taste he has displayed in carrying out the arrangements.

YORK AND DARLINGTON BIRD SHOWS.—It will be as well to remind intending exhibitors for the forthcoming York and Darlington Shows that all birds entered for the York Exhibition can be forwarded on to Darlington by the necessary arrangements being made with the Secretary of the York Show. Judging from the magnitude of the exhibitions recently held, we may expect to hear of the entries being numerous. The prizes offered by the Darlington Committee are of a tempting kind, being £1, 10s., and 5s. in nearly all the classes, besides a number of valuable special prizes, consisting of a beautiful silver-plated cruet, silver medals, silver-plated cream jug, gold-plated Albert, &c. Every arrangement will be made for the reception and comfort of the choicest specimens, and the birds will be well cared for at the hands of a painstaking Committee before returning. We hope to hear of the entries for both places being large. The entries for Darlington will close on October 31st, and for York, November 3rd. Schedules for both are now ready.

THE POULTRY-KEEPER.—No. 25.

THE BRAHMA POOTRA.

A THICK cloud envelopes the origin of this variety, which seems to me (M. Jacque) to be another variety of the Shanghai.

Introduced into France towards 1853, and a short time before in England; the beauty of its plumage, the shape of the cock and hen, its flesh—preferable, perhaps, to that of the ordinary *Cochin*-China, made it much sought after by many amateurs. The rage for possessing it induced forced production, and the deplorable way of bringing up the chickens contributed rapidly to deteriorate these birds. Inferior specimens are easy to procure by crosses between the *Cochin*-China, White Malay, &c.

The first specimens I saw, and were really what the Brahma ought to be. They had exactly the form and characteristics of the best made Cochins-China, but more developed, because the size was larger. The back of the cock was perfectly horizontal; the shoulders large; the hind part formed by an enormous expansion of feathers on the abdomen, and the thigh feathers were extremely large. The tail very short; the leg short and strong, nearly entirely hidden under the thigh feathers. The shank very large and short, hidden under a thick mass of feathers extending far on the toes; the head and neck small for so large a bird.

The colour of the plumage is not less characteristic. Each feather of the hackle (cock) should be marked with a lengthened black mark, and there is a like one on the back, shoulders, and lance-shaped feathers (*fig. 112*). Feathers marked with a grey pattern, very like those of the Cuckoo Cochins-China, are at the side of the breast, near the shoulders, little sickles, the back part of the thighs, and the feathers of the feet. The feathers of the abdomen and sides are grey mixed with white. The breast is white, and the wing-coverts are marked with black, and the middle and large sickles are of a green bronzed colour; and the down beneath the whole plumage is entirely grey.

The form of the hen is like that of the finest Cochins-China. She is low, large, compact; her legs are strong, short-feathered, and hidden under the thigh feathers. Her plumage is still more characteristic than that of the cock, being very like that of the Partridge Cochins; and I have seen and possessed birds whose plumage was exactly similar, the colour only excepted, so that one might reasonably have called one the Brown Partridge Cochins and the other the Grey Partridge Cochins. To this last is given the name of Partridge Brahma, but most of the variety are white at the breast, on the back, and wings. The pattern of the feathers mentioned does not show on the sides of the breast, the shoulders, the tail-covering, the thighs, and the legs. The flight feathers and the tail are black, and those of the hackle are regularly marked with black, as mentioned in describing the cock. The abdomen is strongly mixed with grey, and the same colour is more visible than in the cock across the white part of the plumage. The comb should be straight and single for the cock as well as the hen. With the cock the hackle, back, shoulders, and lance-shaped feathers should not be yellow, as this is often the case with inferior birds, and hardly the slightest tinge of yellow is admissible.

They have made by a cross between the Black Cochins and Brahma a variety they call the Inverted Brahma. The body is entirely black, and the hackle, like that of the ordinary Brahma, appears very clearly on the deep ground of the plumage. The head of the true Brahma should, both in the cock and hen, have a plumage entirely white, only marked with black on the hackle at the end of the wings and tail. Amateurs have made them as much like as they could to the White Cochins and White Malay, &c. The comb is generally double (Malay), the back at an angle of 45° instead of being horizontal. The hind part is scanty. The leg is long, the feathers flowing, and entirely divided from the thigh feathers. The leg is long and without feathers.

This variety, which I believe is no other than a variety of Cochins-China or Shanghai, is perhaps the best of the different varieties. They lay longer (from forty to sixty eggs). The flesh is good, and the hen above all in the quality of acquiring weight is superior to that of other Cochins. The chickens are extremely home-loving, and not at all impatient of confinement. As to the name of Brahma Pouter, it is that of a river in India.

M. Jacque recommends a Brahma cock to be paired with Hondan and Crève-Cœur hens.

POUTERS, ANY OTHER COLOUR OR MARKING.

I HAVE watched the debate on this subject with great interest; and although I think it is very well understood over the country, still, as it is of vast importance to Pouter breeders, of which I have the honour to be one, I hope you will allow me a small space in your paper to correct what I think has been mystified, surely without intention, but it may be from want of knowledge.

Mismarked Pouters of standard colours seem to haunt one writer to such a degree that he has confounded them with Pouters any other colours than the standard colours or markings. He goes so far as to tax Mr. Huie with contradicting himself, and quotes in proof that Mr. Huie admits that he breeds for Meales, Sandies, and Splashes; but I find that Mr. Huie states distinctly that he neither keeps, breeds for, or ever supported mismarked Pouters. In the name of common sense, will Mr.

Fig. 112.

Stuart insist on calling a perfectly-marked Mealy a mismarked Pouter? He may call it an off-coloured bird if he chooses, but the markings are as perfect as the best standard-coloured bird ever seen. Besides, the mealy colour, I beg to submit, is of a far more delicate and superior colour to many of the slaty Blues, pale chequery Reds, milky Yellows, and sooty Blacks seen too frequently at our exhibitions, and in too many of our model lofts.

I think it is quite plain to all fanciers except those that *winna* see, that mismarked birds are those of the standard markings, such as ring necks, solid breasts, gay and snip, or blaze on the face. These have a class for themselves among their own respective colours; why, then, put them among the "Any other colour or marking class?" This class is intended for the Mealy, Sandy, Chequer, and Splash. Mr. Robert Fulton, who knows the Pouter well, says that the great drawback to the Meales is their low price.

This, I say, is the very reason that they are to be found in the lofts of young fanciers, and in those of the working men. And what has the working man not done for the Pouter fancy? Why, then, exclude them and their birds from our exhibitions? I think if Mr. Huie's argument had had no other object than the encouragement of the Pouter fancy among them, it was well worth the starting and well worth the keeping up of an "Any other colour or marking class" at our exhibitions.

I have only particularly mentioned Meales, but there are Sandies, Chequers and Splashes. As a rule, all these birds are very elegant in shape, and all are of great value to those breeders who know how to make use of them. The three former I have seen marked to perfection. How, then, can they be called mismarked? As to the Splash, it cannot be called either a marked or mismarked bird. It certainly is marked to an extent, as a marked Canary, a Splashed or Agate Tumbler, and therefore it comes in among other markings. Mr. Stuart argues that the Splash Short-face is useful for head and beak properties. True; but had Mr. Stuart not deserted his old love—the Pouter, and had he really understood the mysteries of Pouter-breeding, he would have known by this time the great value of the Splash in the breeder's loft. When men such as Mr. Huie and Mr. Ure, for forty years Pouter breeders, advocate their use for breeding purposes, surely a short-lived Pouter breeder should not venture to say, "We can and will do without Meales, Chequers, and Splashes."—JAMES McCULLOCH, *Moss Bank, Uddingston.*

IRON PERCHES IN AN AVIARY.

THE iron perches in the aviary of "E. J. E., Bishop's Waltham," will not injure the Canaries in the least during frost or cold. We know of more than one instance where they have been advantageously used for many years. They are less likely to harbour insects than wood, more wholesome for the birds, and none the worse if rust accumulates upon them. Being impervious to wet, they are not liable to retain the damp and promote cramp. They are likewise more solid, and act with good effect (likened to a butcher's steel upon his knife), and thus tend to keep down an overgrowth of the horn of the bill. Birds can have no particular choice; iron perches are the same to them as wooden ones. They are not of such a sensitive nature as to become affected with feet being cold.

We may conclude they are not very nice as to their likes and dislikes when we consider the fearfully hot doses of cayenne pepper they partake of. Your birds will be more likely to be affected by a severe frost than through the iron perches; but as you state the aviary "faces west and south"—a favourable situation—the birds will pass through the winter well. Canaries can be acclimatised to almost any temperature. We have known many instances where they have wintered well in aviaries where the ice has had to be broken during the day for the birds to obtain water; but it is an advantage where the birds are provided with a well protected recess at the north or the north-east portion of the aviary. The birds, of course, had been well seasoned in the aviaries during the previous summer and autumn. Canaries can well stand extremes of temperature, and we have known them to be very prolific during the breeding season in a most excessive heat over a bakehouse. The change from heat to cold is the all-important matter to be avoided. The glass on the exposed side of the aviary will sufficiently protect the birds from the cold. Beware of stones. It is always better, where glass is used, to have wire netting. Do not place Belgian birds in the aviary. They are very delicate, and much subject to asthma and consumption. Birds in aviaries should be daily supplied with fresh water, a free use of which will wonderfully harden and improve their feathers. Our idea is a small fountain turned on occasionally, and a little rivulet to carry off the water.

KILMURNOCK POULTRY SHOW.—There are twenty-seven medals and timepieces offered in addition to the money prizes. The only fault we have to find with the classes is, that Cochins and Brahmans are for "any colour." No judge can decide satis-

factorily between the merits of a White and Buff Cochin, or between a Light and Dark Brahma. A still worse mingling is "Polands and Crève-Cœurs, any colour." The entries close on the 31st inst.

BIRMINGHAM PHILOPERISTERON SOCIETY'S
SHOW.

THE twelfth annual meeting of this Society took place at the Burlington Rooms, New Street, Birmingham, on the 21st and 22nd inst.; and although the competition is by the rules strictly confined to members of the Society, and by far the greater number of classes are devoted exclusively to birds of the present year, shown singly, the number of entries exceeded that of any of the preceding years, amounting to more than 450 pens. A still more pleasing feature was that, though the numbers increased, the quality of the birds shown was equally improved. In fact, the owners all being amateurs of known celebrity, this Show is generally regarded as one held annually more especially to determine the relative excellence of the young stock that during the late breeding season has enlisted so careful attention on the part of their owners.

The show room selected this year was unquestionably a very great improvement on those in which this Exhibition has hitherto been held, and the willing help of the amateurs interested was such that, although the Show did not close until after 8.30 P.M., every basket was carefully repacked, and those travelling by rail were safely delivered at the Birmingham railway station and signed for before a quarter past ten, thus completely without loss or mishap of any kind to a single specimen. Among the many gems of the Show was a *Satinette* that has certainly never been equalled in loveliness of feather, and shown in a condition but rarely paralleled; it was successful in taking one special extra prize, and had a cup been offered for the best Pigeon in the Show, beyond question it must have received that premium also. There were also several other *Satinettes* that were of far higher quality than now usually met with. A marked feature of improvement prevailed throughout the *Toys*, among which the most noteworthy were Frillbacks, Pigmy Pouters, Swallows of all the known colours, Blondinettes, Fire Pigeons, Ice Pigeons of every shade of marking, from plain self-colour to the most lovely chequering and perect lacing; whilst among the Magpies were some of the most perfectly-marked Pigeons imaginable, possessing also the advantage of the most solid ground colours, whether red, yellow, or black. A cup, value four guineas, for Flying *Tumblers* brought out the best competition of these local favourites yet seen at a Birmingham show. Mr. W. B. Mapplebeck, jun., secured this cup by taking no less than eighty-four points. *Jacobins* were fine and heavily-filled classes, the Reds being perhaps the best shown of any colour. Both English and Foreign *Owls* have been rarely better classes, and the *Antwerps* and *Dragoons*, for which Birmingham has always held a prominent position, were indeed most excellent, all colours being well represented. Mr. Frank Graham exhibited his well-known splendid Yellow Dragon, that distanced all his rivals in an exceedingly heavy competition. In eighty-four classes it is most satisfactory to state that scarcely an inferior class presented itself, and among the usually recognised highest fancies, the *Carriers*, *Pouters*, and *Almonds* were quite equal to those at the generality of shows.

The weather was exceedingly fine, and we were very glad to see among the visitors many who had travelled long distances expressly to attend this meeting, all of whom frankly admitted they had not anticipated the treat that awaited them in all the breeds shown.

The Judges for the strictly fancy varieties were Messrs. Alsopp, Hewitt, Ludlow, and Yardley; for the Flying Tumblers Mr. Gordon. The whole of the Judges were residents of Birmingham or its vicinity.

SINGLE BIRDS OF 1874.

CARRIERS.—*Black*.—*Cock or Hen*.—1 and Medal, W. Nottage, Northampton.
2 and 3, C. Mugg, Bromsgrove. *hc*, G. F. White-house, King's Heath, Birmingham.

MIDDLESBOROUGH BIRD SHOW.

MIDDLEBOROUGH BIRD SHOW.

OCTOBER 23RD AND 24TH.

WE will furnish notes next week. The following is the list of awards.

BELGIANS.—*Clear or Marked Yellow*.—1 and 3, R. Hawman, Middlesbrough. 2, Fawcett & Anderson, Baildon. *vib.* R. Hawman; T. Jobbing, Middlesbrough. C. Z. Howe, Middlesbrough; J. Moffatt, Ilwaco. *Clear or Marked Buff*.—1, J. Moffatt. 2, T. Jobbing. 3, Fawcett & Anderson.

NEWCASTLE.—*Clear Yellow*.—1, G. Cox, Northampton. 2 and 3, J. Adams.

Norwich.—*Clear yellow*.—1, G. Cox, Northampton. 2 and 3, J. Adams, Coventry. *hc*, R. Simpson, Whitby. *Clear Buff*.—1 and 2, J. Adams. 3, J. Bexson, Derby. *hc*, R. Simpson.

NORWICH.—*Ereen-marked Yellow* — 1, Brown & Gayton, Northampton. 2, Moore & Wynne, Northampton. 3 and *vhc*, J. Adams. *Ereen-marked Buff*.—1, J. Adams. 2, G. Cox. 3, Johnson & Armstrong, Northampton. *vhc*, J.

2. J. Adams. 2. G. Cox. 3. Johnson & Armstrong, Northampton. *One*, 3. Stevens, Middlesbrough. *hc*, Moore & Wynne.
NonWich. - *Ticked or Unevenly marked Yellow*. - 1 and 2. J. Adams. 3. J. Bexson. c. J. Greenfield, Stockton. *Ticked or Unevenly marked Buff*. - 1 and 2. J. Adams. 3. R. Hawman.
NonWich. - Crested Yellow. - 1 W. J. Hampton, Darlington. 2. Cleminson

NORWICH.—*Crested Yellow*.—1, W. J. Hampden, Darlington. 2, Clemenson and Ellerton, Darlington. 3, G. Cox. *hc*, R. Waterson, Darlington. *Crested Buff*.—1, Brown & Gaston. 2, G. Doman, Nottingham. 3, G. Cox. *vhc*, Johnson & Armstrong. *hc*, R. Hawmin; W. Carrick, Middleburgh.

COPPEY CREST.—1, J. Brooks, Bradford. 2, J. Stevens. 3, W. Hutton, Baildon. *vhc*, E. Mott & Anderson. *hvf*, Shackleton, Rochdale. *hc*, W. Hutton; J. Stevens.

vic. Fawcett & Anderson, *hc.* J. Shackleton, Rochdale, c. W. Hutton, c. Stevens.
LIZARDS—*Golden-spangled*—1, Cleminson & Ellerton. 2 and 3. R. Ritchie,
 Darlington. *vic.* R. Ritchie; Cleminson & Ellerton. *hc.* J. Stevens, c. J.
 Shackleton. *Silver-spangled*—1, Cleminson & Ellerton. 2, J. Stevens, c. R.
 Ritchie. *hc.* R. Ritchie; J. Stevens, c. J. Shackleton.
LIZARDS—*Gold and Silver-mottled*, with *braka*. *can*—1, 2 and 3. R. Ritchie.

ph., J. Stevens. *hc.*, Clemonson & Ellerton.
CINNAMON—*Jonque*—1, 2, and 3, J. Adams. *hc.*, Z. Howe; J. Taylor, Middles-
 brough. *c.*, M. Burton, Middlesbrough. *Buff*—1 and 2, J. Adams. *S. G.*, Cox.
ph., J. Adams; Moore & Wyane. *hc.*, R. Hawman; J. Taylor; J. Bexson.
hc., J. Bexson.
Yellow—1, 2, and 3, J. Adams. *Buff*—1, Bruyn & Gaston. 2, J. Brooks.

CINNAMON.—*Varietated Yellow or Blue*.—1, Brown & Gayton. 2, J. Brooks. 3, W. & C. Burniston, Middleborough. *rhc*. F. Fritschler, Hurtlepool; J. Spence (2); G. Cox. *hc*, Fryer & Holt, South Stockton. *c*, J. Adams. YORKSHIRE.—*Clear Yellow*.—1, Leno & Renwick, Gateshead. 2, W. Howard, Harrogate. Extra 2, J. Stevens. 3, J. Armstrong, Hurtlepool. *rhc*, C. Holdsworth. *c*, Lebling. F. Williams, Southborough. *hc*, W. Lister.

worth, Harrogate; G. Joblin; R. Williams, Garsbrough. *nc.* W. Lister, Malton; J. Greenfield. *c.* W. Hutton. *Clear Engl.*—I. W. Lickley, Ripon.

2 and 3, W. Hutton. Extra 2, G. Gott, Leeds. *vhc*, W. Howard; J. Whittaker, Bradford; W. Lister; W. Hutton.
YORKSHIRE.—Evenly marked Yellow.—1, W. Hutton. 2, J. Stevens. 3, W. Cotton, Middlesbrough. *vhc*, F. Tritschler; J. Whittaker; W. Hutton. *Evenly marked Buff*.—1, R. Hawman. 2 and 3, W. Hutton.
YORKSHIRE.—Unevenly marked Yellow.—1, J. Garbutt, Stokesley. 2, W. Carrick. 3, C. Holdsworth. *Unevenly marked Buff*.—1 and 2, G. Gott. 3, G. Cooper, Darlington.
CLEAR GREEN.—1, W. Cotton. 2, J. Stevens. 3, J. Rowland, Marske-by-the-Sea.

MULES.

GOLDFINCH AND CANARY.—*Evenly marked.*—1, J. Stevens. 2, J. Cooper. Extra 2, Moore & Wynd. 3, R. Hawman. *vhc*, W. Bates, Nottingham; J. Whittaker; J. Stevens. *hc*, T. Alley, Durham. *Dark*.—1, G. Cox. 2, W. Hutton. 3, T. Tennison, Middlesbrough. *vhc*, G. Dolman; J. Bexson; W. and C. Burniston. G. W. & T. Burton.
LINNET AND CANARY.—1, J. Stevens. 2 and 3, J. Spence, South Shields. *hc*, W. Hutton. *Dark*.—1, J. Stevens. 2, G. Ashman, Stockton. 3, W. Carrick. *ANY OTHER CLASS.*—1, T. Tennison. 2, W. Hutton. 3, R. Hawman (Greenfinch and Canary). *vhc*, A. Waterworth, Leeds (bullfinch and Goldfinch).

BRITISH BIRDS.

GOLDFINCH.—1, T. Allenby. 2, R. D. White, Malton. 3, W. Carrick. *hc*, P. Henrice, Middlesbrough; W. & C. Burniston.
LINNET.—Brown.—1, W. Carrick. 2, J. Carrick. 3, W. & C. Burniston. *vhc*, W. Carrick; J. Carrick.
BULLFINCH.—1, J. Rowland. 2, W. Lister. 3, J. C. Bamher, Preston.
ANY OTHER VARIETY.—1, Fryer & Holt. 2, J. Bailey, Ormesby. 3, R. Pearson, Whitby. *vhc*, F. W. Castelow, Sunderland; J. Bailey. *hc*, W. Lister; R. Pearson; H. West, Darlington; W. & C. Burniston.
SELLING CLASS.—1, W. Henderson, Whitby. 2, G. Cox. 3, M. Barton.
JUDGE.—Mr. J. N. Harrison.

SOUTH STOCKTON CANARY SHOW.

The members of the South Stockton Ornithological Society held their first Exhibition of Canaries, Mules, and British birds in the Temperance Hall, South Stockton, on the 16th and 17th inst. On the whole there was a very good show of birds. The principal features in the Show were the high-coloured Norwich of Mr. Adams, of Coventry, and the Yorkshire-bred birds which were exhibited in somewhat unusually large numbers, the four classes devoted to them containing no less than eighty-nine specimens. The Belgians, as is mostly the case, were very few in number. There were several excellent specimens of the Cinnamon and Lizard Canaries exhibited. The following are the awards:—

BELGIANS.—1, T. Joblin, Middlesbrough. 2, Fawcett & Anderson, Baildon. 3, R. Hawman.

NORWICH.—Clear Yellow.—1 and *vhc*, J. Adams, Coventry. 2, Johnson and Armstrong, Northallerton. 3, Petty & Cuss, York. *Clear buff*.—1, R. Simpson, Whitby. 2 and 3, J. Adams. *vhc*, Johnson & Armstrong; J. Spence. *hc*, R. Layfield; Clemmison & Ellerton, Darlington.

NORWICH.—Evenly marked Yellow or Buff.—1, Johnson & Armstrong. 2, J. Adams. 3, R. Simpson. *hc*, J. Prior. *Unevenly marked Yellow or Buff*.—1 and 2, J. Adams. 3, J. Greenfield. *vhc*, J. Bell; R. Hawman; Clemmison & Ellerton; Johnson & Armstrong. *hc*, R. Jackson; T. Clemmison.

NORWICH.—Crested.—1, R. Hawman. 2, Johnson & Armstrong. 3, R. Triffitt, York. *vhc*, R. Triffitt; Clemmison & Ellerton. *hc*, A. Armstrong, Newcastle; Harrison & Huntress.

CINNAMON.—Jongue.—1 and 2, J. Adams. 3, M. Burton, Middlesbrough. *vhc*, J. Taylor. *hc*, J. J. Harris. *Buff*.—1 and 2, J. Adams. 3, J. Taylor. *vhc*, R. Simpson; W. Carrick, Middlesbrough; Johnson & Armstrong.

LIZARDS.—Golden.—1, 2, and *vhc*, R. Ritchie, Darlington. 3, Clemmison and Ellerton. *Silver*.—1 and 2, R. Ritchie. 3, Clemmison & Ellerton. *vhc*, J. Stevens; R. Ritchie.

YORKSHIRE.—Clear Yellow.—1, Johnson & Armstrong. 2, H. Walton, Stockton-on-Tees. 3, W. Hutton, Middlesbrough. *vhc*, J. Stevens (2). *hc*, R. Stenhouse; J. Rowland. *Clear Buff*.—1, J. Thackrey, Bradford. 2, L. Belk, Dewsbury. 3, R. Pearson, Whitby. *vhc*, C. Holt; J. Garbutt; Johnson and Armstrong; J. G. Bell; Fawcett & Anderson. *hc*, N. Oughtred; J. Thackrey.

YORKSHIRE.—Evenly marked Yellow or Buff.—1, J. Stevens. 2, J. Wilkinson. 3, L. Belk. *vhc*, J. Thackrey; T. Tennison; Johnson & Armstrong; W. Thornton. *hc*, J. Thackrey (2); J. Garbutt; W. Cotton. *Unevenly marked Yellow or Buff*.—1, J. Rowland. 2, J. G. Bell. 3, W. Carrick. *vhc*, J. Thackrey; C. Holdsworth; G. Turner; J. Garbutt; J. Wilkinson; R. T. Hudson.

CLEAR GREEN.—1, J. Stevens. 2, R. Jelly. 3, W. B. Aubrey.
ANY OTHER VARIETY.—1, L. Belk. 2, Fawcett & Anderson. 3, J. Fryer. *vhc*, J. Garbutt; W. & C. Burniston; Fawcett & Anderson; W. Ware. *hc*, J. Sedgwick; J. Brock.

CAGE OF SIX.—1, Clemmison & Ellerton. 2, T. Clemmison. 3, Johnson and Armstrong. *hc*, J. Dick; W. J. Hampton; J. Greenfield.

GOLDFINCH MULES.—1, J. Stevens. 2, T. Tennison. 3, J. Spence.
LINNET MULES.—1, J. Spence. 2, J. Stevens. 3, C. Holt. *vhc*, G. Ashman; W. Raw; J. Spence.

GOLDFINCH.—1, W. & C. Burniston. 2, G. Johnson. 3, P. Henrice.

LINNET.—Brown.—1, W. Carrick. 2, T. Tennison. 3, T. Dickenson. *vhc*, W. Carrick; J. Harston; J. Greenfield; J. T. Harrison; W. Buckle. *hc*, W. and C. Burniston; R. Pearson; W. Batchelor.

BRITISH BIRDS.—1, J. Gales. 2, J. T. Harrison. 3, R. Pearson.
SELLING CLASS.—1, J. Stevens. 2, J. Fryer. 3, J. Rowland.

JUDGE.—Mr. W. A. Blakston.

A SHORT DIALOGUE ON A CANARY SHOW.

"LET us go and see the pretty birds," said a little girl to her mamma, as they were recently passing a place where a bird show was being held.

"No! my dear; they say Canaries now are so 'hot,' that I am fearful of venturing with you too near them. It was only the other day I actually read of one being a 'scorchers.'"

"But, mamma, perhaps some of them are only 'warm.'"

"Well then, we will go and judge for ourselves."

They therefore entered the show, and whilst examining many splendid specimens, overheard a visitor remarking to his friend "That's a 'hot' un," at the same time pointing to a very beautiful-looking Canary.

The lady's attention was rivetted to the remark, and curiosity brought forth the explanation that it meant strength of colour.

She was amazed when informed that the deep orange tint could be produced through a free use of cayenne pepper, and was further informed that those who knew best how to administer the pepper would succeed in obtaining the best-coloured birds, if they were of "good breed."

The little girl, who had been attentively listening to the explanation, said, "But mamma, if they are like the Claimant their memories may fail, and they may forget how to give the pepper, and then what use is good breed?"

"Well my dear, they will then meet with disappointment, which I trust you will learn to bear up against. The little birds you see around us were sent for our pleasure, and to fill our hearts with gladness."

BRIGHTON ALL-ENGLAND BIRD SHOW.

In connection with the Sussex third grand annual Exhibition of poultry, Pigeons, and the first of dogs and cats, a Bird Show was held. There were 153 cage birds exhibited, most of which were of the choicest kinds. The competition with many of the high-coloured birds was severe; but Mr. Adams exhibited some "great guns" in the way of colour. The silver cup offered to the winner of the greatest aggregate number of points was won by Mr. Lulham, of Brighton, he making fourteen points. Show was held at the Royal Pavilion. We published the awards last week.

HIVES.

The question of hives is a very important one for apiculturists, and it is desirable to view it from several stand-points. Some five years ago I ventured to express my opinion on the sizes and materials of several kinds of hives in these pages, and for doing so I have been roundly abused. I again approach the consideration of the subject with some reluctance, and hope to be able to discuss the question with fairness, and with a touch of harshness of spirit or language. In all honest investigation no one has anything to fear or to lose. In all honest discussion, the vanquished more than the victor is enriched. Every question has two sides.

The material of which a hive should be constructed is forced on the attention of apiarians by some who would have us believe that hives made of wood are better than the "wasteful, murderous straw skeps." Such advocates assume that wooden hives tend to the preservation of the lives of bees, and straw ones to their destruction; but the destruction of bee life does not depend on this or that kind of hive, or whether hives are made of wood, straw, or other materials.

Wood hives are more durable than those made of straw, and if they possess another point of superiority I have failed to discover it. In his practice with bar-frame hives the late Mr. Woodbury found that straw is much better than wood, and therefore during the last years of his life his bar-framers were made of straw. Mr. James Lee of Bagshot, who took the first prizes at Manchester and the Crystal Palace Bee Shows for hives and bee furniture, is a practical bee-keeper as well as an extensive hive-maker. At the Manchester Exhibition he told me that wooden hives are very objectionable, owing to their condensing the moisture of the bees on their insides.

Mr. Quinby, who is, to say the least, one of the largest bee-keepers in the world, and an enlightened bee-keeper in America, being President of the Apian Society there, makes the following remarks in his book on "The Mysteries of Bee-Keeping." At page 300 he says, "We have all heard of the great success in wintering [bees] in the old-fashioned straw hives fifty or a hundred years ago. They were discarded, it is said, on account of harbouring the moth worm, and in consequence, Mr. Langstroth says, 'Straw hives are warm in winter and cool in summer,' and again, 'hives made of wood are fast superseding all others.' Notwithstanding this," continues Mr. Quinby, "I shall greatly err in my judgment if straw as a material for hives does not in a great measure regain its former position in public favour. We have now straw hives of convenient shape, some of them covered by a patent, but that is chiefly on the manner of holding the straw. The proper degrees of heat and cold when most desirable are great advantages, and these can be obtained on principles long ago recognised. Hives made with double boards enclosing a dead air space do very well in regard to warmth, but they do not dispose of the moisture with sufficient rapidity. The moisture must be got rid of, and in no way can it be done so well as by straining it through straw. Besides being advantageous for wintering, straw hives are superior in keeping the temperature warmer and more uniform throughout the spring, thus promoting early breeding and swarming. After the beginning of summer they do not seem to possess any special advantage over wood hives further than that their combs are less liable to melt down. But the objection first raised by most persons—viz., harbouring the moth worm, has not arisen in my experience. Out of a large number containing bees through the summer not one has been injured in this way."

Mr. Yates of Manchester began bee-keeping with wood hives, and to prevent the moisture from condensing on their inner surfaces he covered his hives with a very thick boiler felt, but it did not answer. At certain seasons of the year the inner surfaces of wood hives are covered with moisture, which rots the combs. The condensed moisture may always be seen by turning up wood hives at those seasons, and often it may be seen running down the sides of the hives and over the flight-board. This is the first year that my apiary has been without a wooden hive in it for twelve years. Every year such hives gave us abundant evidence of their unsuitability for bees and comb-building. The condensed moisture rots the combs in its immediate neighbourhood, and rotten combs can never hold honey or brood, or be a foundation on which to build fresh combs. The rotten parts are taken down every spring, and new combs put in their places. In turning up a wooden hive at the swarming season we often find the new pieces give the hive the appearance of one recently filled by a swarm. During the summer months hives are generally full of bees, and warm enough to dispel the moisture by the doors. In autumn the wood again becomes covered with moisture; even a riddle rim, which may be used as an eke to a straw hive, becomes covered with wet when not a particle can be seen on the straw.

Straw as the best material for hives has never lost its position in Scotland, and I believe that the great bulk of the successful bee-keepers there would not use wooden hives even if they could get them for nothing. I believe that the teaching of experience will lead most bee-keepers seeking great results to the adoption of large straw hives. Many of our friends have hives of wood and glass, hives of various shapes and materials. They are amateurs seeking pleasure and recreation from bee-keeping; but though they sometimes get a harvest of honey, and are satisfied with it, they cannot be reckoned amongst bee-farmers seeking large returns.

Like Mr. Quinby's, my hives have never suffered from the moth worm; indeed, I hardly know what it is. The work of plastering the inside of straw hives with propolis has been exaggerated. We have now a hive full of honeycomb, weighing more than 40 lbs., which has been in use for eight or ten years, and I can scarcely see any propolis in it. I do not think that 3 ozs. of propolis could be found in fifty of my hives. They are so warm and well made that a lining of propolis is quite unnecessary. Thin, badly made straw hives do sometimes get a coat of propolis, and this, as Mr. Quinby puts it, "will render it less efficient in ridding itself of moisture. I say less efficient, because it (straw) is better than wood at any rate." I have known a straw hive filled with combs in seven days by a single swarm, weighing altogether 45 lbs. Not much time lost in plastering here.—A. PETTIGREW.

I am a thorough believer in the old straw skep hive, and am sorry it seems to have been so little appreciated at the Crystal Palace Show. If you think a short account of my first swarm of this year will be interesting to the readers of your valuable Journal, or will tend to make apiarians think more of my favourite hive, I shall feel much obliged if you will insert this letter in your next publication.

The swarm I speak of was drummed out of a 16-inch hive on the 4th of June, into an 18-inch straw skep of the Pettigrew pattern. It was a strong swarm, and the weather was fine for some time after it was driven, so that I never had occasion to give it an ounce of sugar, or to feed it in any way. On the 25th of July I found the hive was quite full of comb. I then put an eke on it 4 inches deep, and took it to the Glossop moors. Since that date the weather in this part of the country, to the middle of September, was rather unsettled, and I should think we had only about ten days of really good bee weather; but in spite of this, when I brought my hive home on September 19th, I was delighted to find it weighed, including board, 100 lbs.

If this result does not speak volumes for the old despised skep hive, no poor words of mine will be of any avail.—EDWARD THORP, *Sale, Cheshire.*

LIGURIANS.

SOMETHING like ten years ago the late Mr. Woodbury set himself energetically to work to assist apiarians to ligurianise their stocks by the substitution of Italian queen bees for the more legitimate sovereigns, but felt compelled to discontinue the scheme on account of the frequent failures, the interlopers being so often slaughtered. I do not think the method of introduction pursued has altered much, neither can I say the amiability of the worker bees has to any extent increased, but certainly to make the regal exchange in question is not now considered a formidable operation, and the risk is but small; indeed, with frame hives ten or twelve minutes should afford ample time for the work, and the danger to the new sovereign is almost nil. With skeps or closed boxes more time is occupied, it being imperative that the black queen should be first captured; and to effect this it is generally necessary to drive out the bees until

the queen is discovered and safely removed. Sometimes she will elude the most educated and vigilant eye in spite of patience and assiduity, and it is never safe to introduce the new sovereign without being quite certain the old one is not in the hive. The mere fact of not finding her is not sufficient, and in the event of a battle royal it must not be forgotten the foreigner is tired, cowed, and enfeebled by her long journey and confinement, whilst her antagonist is in her accustomed vigour. Supposing the old queen is surely removed, it would never do to introduce the new one to the tender mercies of the workers without proper precautions being observed, for bees are not noted for hospitality to strangers, so she must be enclosed in a wire cage placed in the hive, and kept so imprisoned for at least twenty-four hours, when the excitement of the bees at the loss of their old queen will have passed away and the new one will generally be gladly accepted. It is advisable to sprinkle the bees and queen liberally with scented syrup both on the introduction and release. When the above time has elapsed open the cage gently and let her majesty walk out. Watch carefully the workers. If they take no notice of her or merely walk over, licking and feeding her, all is well and she may be safely left; but if she is seized by the legs and wings, and the bees assemble tumultuously about her, beware! In a few minutes the bees gather into a ball with the queen in the midst, when regicide is meant. Take up the knot of bees and drop them into a cup of water, which will effectually separate the cluster and hurt none; or pull off the bees until the queen is released, and immediately cage her again for another day's imprisonment, when the same process must be repeated with probably a better result. If a cluster is again formed try the effect of worrying them about with some tobacco smoke for a few minutes, when most likely they will give up in disgust.

Fertile Italian queens are now imported in considerable numbers at irregular intervals, and are generally bespoke on their arrival, for in the little boxes they arrive in they will not thrive long, and the casualties of the journey are sometimes serious. Their cost in England varies according to season, from about 7s. 6d. in October to 15s. in May. This is a considerable reduction from their value when first introduced, about fifteen years ago, which was something like two guineas. At the price now obtainable they will amply repay their speculative purchaser, for there is no question the Ligurian variety is a far better worker and breeder than our old friends. They may be seen sallying forth to work long before the true Britons, and still at labour after their neighbours have sought their well-earned rest. The queens are more prolific, probably because of the above; for whilst food comes into the hive, breeding will go on, and if supplies are stopped so is egg-laying. The introduction of a Ligurian stock is a general source of benefit to the other bees of the neighbourhood, for the natural law of "fresh blood" giving vigour holds good with bees as with larger animals, and very quickly it will be found the progeny of many young queens will show signs of love-making by the strangers. The one and only great source of disappointment with Ligurians that I am aware of, is the impossibility of being certain that the queens bred by them here will be the mothers of pure Ligurians, from the (as yet) impossibility of controlling their choice of sweethearts. This will decrease as the Italians get more widely spread, but at present the gentlemen in black have far the greatest majority; but even a mongrel stock is an improvement on the original black bees pure and simple. The introduction of a Ligurian queen into a stock of common bees, gives us indisputable evidence as to the length of a worker's life, which may be said to be regulated not by time but by the amount of labour executed in the midst of summer, when the days are long and the weather fine. Six weeks are sufficient to show that scarcely a black bee remains in the hive, all being dead and replaced by Italians. "A short life and a merry one," should be their motto. But let the introduction of the new queen take place in October, and we must take months in lieu of weeks to arrive at the same result; but even this is very curious, and the uneducated bee-keeper would scarcely credit us did we tell him that all the bees he has (except the queens), will have ceased to live before the flowers of May enliven the fields with their beauty and perfume.

The bees arrive from Italy in little deal boxes about 5 inches square, a queen accompanied by about a hundred workers; and on lifting the cover a remarkable proof is afforded of how much our irritable little friends may be subdued. Open the box, there they are, a fluttering, buzzing little swarm, each bee armed with a sting and a pair of wings, but showing not the slightest inclination to use either, as harmless as so many flies. Hold the box in hand, they buzz and seem to boil over the edges, running about the hands; and having apparently ascertained all about it, back they go to attend their liege sovereign without any attempt to investigate further or revenge the indignities they have lately suffered. This state of subjection is the whole secret of driving: it may be summed-up in one word, "terror." Only thoroughly alarm the bees and they become tractable and harmless; but there always remains the danger of accidentally

hurting one, and then, on the principle that "a worm will turn when trodden on," a touch of a very little instrument may make somebody cry, Oh!—JOHN HUNTER, *Eaton Rise, Ealing.*

HONEY HARVEST IN SCOTLAND.

THE honey harvest in this part of Scotland (East Lothian) this year cannot be called a prosperous one. The stocks were weak in the spring, and though the season in the early part was dry, it was often so cold as to prevent the bees from carrying after the spring flowers were over. We were fortunate in having nearly one hundred acres of turnip seed within a mile of us, which helped us greatly, though not so much as it would have done if the weather had been good. We had 2¹/₂ of frost on the 12th of June, injuring the potatoes much. Still there were some early swarms—the first a neighbour's on May 17th, and my first was on the 29th.

The season for the white clover was unpropitious; though there was a quantity the bees did not work on it as they used to do. It was only on rare occasions that it gave off its usual fine odour. However, there were very fine white clover supers or tops obtained, though I did not increase my stock of hives more than from sixteen to twenty, but gave room for breeding, and by uniting I increased a ten-bar Woodbury to a twenty-three-bar, and a ten-bar to fourteen. During July they got a good deal of honeydew from the trees, which spoilt a number of tops, but it enabled the bees to continue breeding, and they were sent to the heather ten miles from here on the 29th of July, a week earlier than usual, in very good condition for gathering honey, full of bees and brood. The heather being fine we fully expected a lot of honey, but the weather got unsettled, and a quantity of rain fell the first week at the time the heather was at its best, so that our expectations were not realised.

The average weight which my twenty hives obtained was 16 lbs. each, some gaining 21 and 25, one 30¹/₂, some only 6 lbs. Last year the average was above 10 lbs. There are, consequently, a great number of half-finished supers in this district, and as we generally have them in supers, this is not a profitable season for bee-keepers.

I use the old straw Stewarton and Woodbury ten-bar frame hives. I generally take the two outer bars from each of the latter just before they are sent to the heather, and whatever the season is these are mostly filled with honey, even when there are no supers. These bars weigh from 4¹/₂ to 5 lbs. each, so that by using them I have always good pure honeycomb for the use of the family: hence the superiority of the bar hive to any other.

I have reduced my stock to fifteen, breaking up the rest, and putting the bees into weak hives, destroying unfertile queens, and covering up for the winter. The old combs are selected; those which never had brood in them and entirely free from farina are cut up, and run through a cloth, which is quite pure. The other combs are cut up and run, and used for feeding the bees with. The honey is not fit for eating, even though the combs are never squeezed in any way. No one would eat honey again were they to see it squeezed or run, and I am astonished to see would-be bee-masters recommending such a disgusting practice when there is no need for it. A neighbour had eight hives at the hills, but he did not weigh them, consequently could not say what was the average; but it must have been about the same as my own, as they were about equal in strength. He will reduce his stock to about the half (forty) by driving and uniting two weak stocks. No bees are smoked here, and he never has any fighting. He will unite as many as eight into one, and does not adopt the bad practice recommended by some of smothering the bees with honey or sugar syrup seasoned with mint. Mine were all united without any attempt to fight.

Full finished supers holding from 10 to 15 lbs. are selling at 2s. 9d. per pound, and as low as 1s. 4d.; run honey about 1s. per pound.—A. SHEARER, *Yester.*

BEE CHRONOLOGY.

MR. PETTIGREW says the bee season of 1871 has brought to light something new in the habits of bees—viz., that they will for a time permit a divided sovereignty, as is instanced in the case of Mr. Boulton's hive, of Ulverston. I can assure him that the facts of this case are indisputable. Nothing was exaggerated; but the plain facts as stated by me in your columns can be verified, if need be, by the testimony of at least a dozen of unimpeachable eye-witnesses. The facilities of examination given by the Woodbury hive leave not the slightest loop-hole for doubt, uncertainty, or incredulity. The bare facts stand out as they were stated; the reasons for such I leave for elucidation to those better calculated, from experience of the habits of bees, to adduce.—BETA.

OUR LETTER BOX.

GOLD-LACED BANTAMS AT BRIGHTON SHOW.—My cup pen is either sent somewhere by mistake or stolen. If you would name the subject in your

Journal it may assist me to find them. The number of pen lost is 169.—M. LENO, *Markyate Street, Dunstable, Beds.*

FOWL'S INTESTINES ULCERATED (J. M.).—The fowl would gradually have wasted away and died. We know neither the cause nor cure of ulcerated intestinal organs.

LIGURIANS (*One who would Progress*).—Write to the dealers in hives and honey who advertise in our columns.

THE HONEY-EXTRACTOR.—The honey-extractor made by Mr. Walton and exhibited at the Crystal Palace will be fairly tried and tested here next Saturday afternoon, October 31st. If any of the readers of this Journal have a desire to see the slinger at work they will have an opportunity of doing so if they come here at three o'clock next Saturday.—A. PETTIGREW, *Priory Vineyard, Sale.*

PETTIGREW'S FIVE (*The Cornish Duckwing*).—In a week or two Mr. Pettigrew will give a woodcut and full description of his hives in our columns. They are made of wheaten and rye straw, firmly and neatly sewed with canes, beautiful in shape and appearance, and when filled weigh from 60 to 130 lbs., according to size. They are made in Ayrshire, and sold by Mr. Yates of Manchester.

COLLATERAL HIVES, &c. (J. R. Edgbaston).—Nnt's hives are as good as any collateral hives can be—perhaps we might say as bad. We have tried them and other variations of the same principle, and discarded them all. Undoubtedly the most profitable system, take it all in all, is the storifying mode of management. As to your hive infested with black bees, we cannot make out exactly from your letter the circumstances of your case. The snail had certainly nothing to do with it. It was the weakness of the hive which permitted the snail to enter. We cannot tell the cause of the appearance of these black bees.

WRITE RABBIT SKINS (J. J. M.).—As soon as the skins taken off scrape off all the soft internal part, and then sponge it with a strong solution of alum.

REMARKS.

21st.—Very high wind in night, and till the afternoon; rain in the morning; fine evening, and very little wind.

22nd.—Rather cold, but a splendid day throughout.

23rd.—A very bright fine day, but colder than we have had this season.

24th.—Foggy early; fine in the middle of the day, but dark early in the evening; splendid moonlight night.

25th.—Dull and raining at 9 A.M., continuing dull and cheerless all day; very little rain, but not any sun.

26th.—Rain in the morning, and at intervals all day, and a wet night; but the quantity of rain that fell was small considering its frequency.

27th.—Dull damp day; occasional very bright gleams of sun in the middle of the day, but only for very short periods; and a damp night.

Very windy on the 21st, and rather cold on the two following days, though bright and pleasant. Since then much warmer, but very dull. The mean temperature about 3° below that of the previous week.—G. J. SYMONS.

COVENT GARDEN MARKET.—OCTOBER 23.

THERE is no improvement here, and no change worth notice.

From observations taken near London during forty-three years, the average day temperature of the week is 51.5°; and its night temperature 35.3°. The greatest heat was 63°, on the 5th, 1852, and 6th, 1834; and the lowest cold 17°, on the 9th, 1861. The greatest fall of rain was 1.03 inch.

NOTES ON NECTARINES.

FEW things are more vexatious than the discovery that fruit trees which have had our best care in planting and culture, do not yield fruit like that expected; the selection of sorts is consequently a matter of such importance and difficulty withal that only the initiated can hope to be really successful. Flavour, size, productiveness, and appearance are all desirable qualities, and each kind is valued just in proportion to its merits in these respects. Now I do not know all about Nectarines, but there are a few facts deduced from late experience which may assist others, and which, I think, cannot be written at a more seasonable time than the present.

It is now nearly four years ago that stations were prepared for a collection of fruit trees which have since been under my care, and among these the Nectarines have certainly well maintained their position. The whole of them have done well, and this year many have produced the first crop of fruit. Of these Lord Napier is undoubtedly most worthy of the first place; its size is something wonderful, well-grown fruit measuring fully 8 inches in circumference. I very well remember pausing before some Pitmaston Orange Nectarines which had won the first prize at the late fruit show at the Crystal Palace, and fancying what a sensation a plate of Lord Napier would have caused if placed by its side. In flavour and colour the melting flesh of Lord Napier is also excellent, and what adds so much to its value is its earliness, the huge fruit ripening early in August. The tree is vigorous and healthy. Altogether it is a first-rate sort, and no one will ever regret adding this grand Nectarine to their collection. There can be no doubt that it and others of Mr. Rivers's equally fine seedlings are destined to replace most of the older sorts by their superiority in size and flavour, and by extending the season for ripe fruit very considerably. The fruit of Rivers's Stanwick Elruge was not so large as Lord Napier, but it was very fine and excellent. The crop was abundant. I shall, perhaps, best show how highly I esteem it by extracting from my fruit book the note of it for this year—"Tree in full vigour. Splendid crop of fine fruit. Flavour excellent. This is quite one of the best." Rivers's White was good, the tree yielding about half a crop. There are others of the Sawbridgeworth strain that were planted later, and have not yet fruited. Pine Apple I know to be most delicious. Albert Victor, Victoria, Prince of Wales, and Large Elruge are the other sorts, which I believe must be grown, and which I hope to know more about next season. Of older kinds Pitmaston Orange had an abundant crop of small fruit, Violette Hative and Balgown had very little fruit, owing, probably, to a very robust growth. They are both in a promising condition for next season.

Considerable difference of opinion prevails as to the amount of vigour which it is desirable such young trees should possess, some persons regarding a shoot of 5 or 6 feet as just so much wasted vigour, and they would

root-prune and pinch-off the ends of any growth exceeding stated limits rather than see a Peach or Nectarine tree exhibit the slightest approach to grossness; so bigoted are some in this respect that I have known instances of trees being actually lifted and every root severed during the season of growth in order to reduce them to a certain standard, the result being a weakly growth and an abundant crop, equally void of vulgarity on the score of size; for in no instance could a single fruit be found which at all approached the recognised standard of excellence. Now, the end and aim of every cultural system is undoubtedly to obtain an annual supply of first-class fruit. When this is well done the trees at this time of the year will invariably be found to have made a robust new growth, with the bark firm and bright, and bristling with plump triple buds. So long as one can point to such a result one need not mind a little criticism. My own practice is somewhat of the rough-and-ready type. The trees are taken care of, but I do not mind a few gross shoots, as will be understood when it is stated that most of the Nectarine trees, which were planted in January, 1872, have reached the coping boards at the top of a 10-foot wall. The branches of one tree of Balgown have a lateral spread of upwards of 20 feet; a Barrington Peach is equally fine, and from present appearances I have reason to anticipate a heavy crop on both trees next season. Had all growth that might be regarded as rampant been pruned as closely as is sometimes recommended these trees would not only not have been above half the size, but, what is far more important, next season's crop would assume a much less promising aspect. Take, for example, a shoot of extraordinary strength of last year upon the Barrington Peach. Last autumn it had not a triple bud upon it, yet it was not cut away, but only shortened to about 4 feet, and the result is that it has made a splendid lateral growth of stent fruiting wood, each shoot being 2 to 3 feet in length, with abundant triple buds. Very different would the result have been had it been cut off altogether, for then it would have been replaced by two or three shoots equally gross and equally fruitless. When the pruning knife is thus misapplied it can no longer be regarded as a scientific instrument, and is worthy only to be classed with a woodman's bill-hook.

All kinds are not equally robust; thus Pitmaston Orange Nectarine, Noblesse and Early York Peaches are not so much inclined to develop a strong growth as early maturity and fruitfulness, affording fruit in quantity long before the more vigorous sorts. I do not agree with those who would try to bring all kinds into a uniform condition of fruitfulness by a given time, but strive rather to adapt my culture to the peculiarities of each sort, believing that by so doing I shall eventually render them more healthy, and consequently more fruitful and durable, than if they were subjected to a system which is not commendable even for its precision. I said I do not object to a few gross shoots, and really I do not well see how one could fairly do so after making the stations as fertile and sound as possible; for what was one's object in so doing? Was it not to promote strength and

rapidity of growth in the first instance, so that when they began to yield full crops they might possess stamina even to superfluity, and continue year by year to bring a full crop to its fullest possible maturity in size, flavour, appearance, and quantity, as well as to make a free growth, not of mere abortive spray, but of those noble shoots long, stout, and strung, brown yet bright and ruddy in appearance, firm in texture, and thickly set with full, plump, triple buds, such as cause one's heart to rejoice in the reward which even they afford for past care and culture, and in the brighter promise of a teeming future crowning our efforts with repeated success?—EDWARD LUCKHURST.

CROCUSES AND GERANIUMS.

The following system of beautifying his flower garden in spring and summer adopted by a leading Yorkshire agriculturist is worthy narration. It is easy, simple, certain, and within the reach of all who wish their flower beds to be in the best order and bright during the greater part of the year. The owner of the garden is a Journal reader, and is willing that the system, which has served him so long and so well, should be noted for the benefit of all whom it may concern. It is the very essence of simplicity, and, with the least possible trouble, results in some of the finest *Crocus* beds and the finest *Geranium* beds ever seen.

The plan is as follows:—The *Crocuses* were planted 2 or 3 inches apart, and 3 or 4 inches deep. The surface of the ground was then covered to a depth of 3 inches with good spit manure, which acts as a protection during the winter, and at the same time enriches the soil by the washing of the winter's rains. Early in the spring, after the manure has become ameliorated by the rain, frost, and sun, the rake is used, which produces a fine surface mould, and during the summer becomes a very rich soil, giving all that is needed for the growth of summer bedding plants. The *Crocuses* are never removed from the beds, but when the grass is matured it is cut off just below the surface of the ground. By this time the *Geraniums* are ready for planting. The beds are not dug at all, but the plants are simply put in with the trowel, causing as little interference with the soil as possible. If a *Crocus* is dug up it is just put into the bottom of the hole again with the *Geraniums*. In the autumn, on the removal of the summer plants, the same rich surface-dressing is given the beds, which are never dug.

This system of top-dressing, raking down, and *Geranium* planting is continued year by year, the *Crocus* roots, of course, getting deeper from the surface, but only each spring to come up finer than before. The depth of covering is thought to be a preservative against mice, which never do them injury. This plan has now been adopted nine years. The size of the *Crocus* bloom is something wonderful, and the buds in spring are one thick dense glowing mass of colour, extorting the admiration of all who see them. The increase of bulbs by this let-alone system and top-dressing has been great, even, as the owner says, "more than twice quadrupled;" hence the massive bloom. The *Geraniums* are equally fine, and during this past season of drought were considered by far the best beds in the district, and always surpass in effect beds dug and planted in the ordinary way.

Annual surface-dressings of good spit farmyard manure and never digging are, speaking paradoxically, the root of the success of this extremely simple and effective plan of spring and summer garden decoration. It is admirably adapted to amateurs, involving, as it does, so little labour, skill, and attention. The first outlay in bulbs lasts a lifetime, as they increase and improve year by year. They are planted some in mixture, but mostly in masses of one variety, with a distinct kind for edging; but this, of course, is a matter of taste which each can determine for himself.

The varieties of *Crocus* used, which have in this case proved so great a success, are *Caroline Chisholm*, white; *David Rizzio*, purple; *Sir J. Franklin*, large purple; *Sir W. Scott*, lavender-striped; *Superb*, yellow; *Princess Alexandra*, purple; *Mary Queen of Scots*, white.

It may be added that anyone deciding on this easy and satisfactory mode—proved so by nine years' experience—of garden embellishment, should lose no time in getting in the *Crocuses*. They are often kept out of the ground too long—that is, the bulbs are suffered to grow too much before they are planted, when a portion are sure to decay, or if they do not perish entirely, make small incipient bulbs for another year. By this too common procrastination in planting, thou-

sands of *Crocuses* are wasted every year. There are two things *Crocuses* cannot endure—viz., a stagnant waterlogged site and poor soil. It is necessary, therefore, for this permanent planting to see at the outset that the beds are fairly drained and the top-dressing will do the rest. If the soil is of a free sandy nature the bulbs may be simply put in without any other mixture; but if strong and heavy, it will be very advisable to surround and cover them with something lighter. A barrowful of dried leaf mould and sand in equal parts will go a long way, and will do much in such soil to promote success. The main thing is not to plant bulbs that have grown an inch or two in paper bags, thus exhausting their vital force, and directly predisposing them to decay. If beds cannot be prepared at once pack the *Crocuses* close together on a hard bottom outdoors, and cover them with 2 inches of light soil. In a month, in addition to top-growth, they will bristle with roots, and be in fine condition for final planting.—J. WRIGHT.

WANTED A GEO-HYGROMETER.

HALF the failures with indoor fruit culture arise from improper or insufficient watering. Cannot some kind scientific friend devise a simple method of ascertaining at any time the comparative amount of moisture contained in the soil 18 inches or 2 feet below the surface? In the first place it is not easy to find out what is the average amount of water required. A study of the amount of rainfall will not give it, because compared with rain our modes of watering are very imperfect. There is much more waste attending it, because artificially prepared borders are generally so much more porous than the natural soil, which is only stirred a few inches below the surface. The drainage also is more perfect than it generally is in the open air. The soil is allowed to become drier in winter, the growth is more luxuriant, and consequently evaporation goes on faster. Fire heat is also drier and harsher than sun heat, and it takes more moisture to make it genial.

Even after having succeeded tolerably well one or two seasons, and having carefully noted the quantity of water used each time, and how often applied, there is no guarantee that the same quantity will be the right quantity another season, for there are exceptional seasons, and exceptional seasons require exceptional treatment. The past summer has been a very exceptional one, and its influence has been quite as marked on indoor vegetation as it has on that out of doors. Amateurs are very anxious to have rules laid down as to how often they should water their plants. Now, to show how difficult it is to give directions on this point, I may state that during the early part of the past summer it was found that fruit borders required water about once a fortnight, which in the previous year only required it once in five or six weeks. The plants had grown considerably, and had, perhaps, doubled their evaporating surface, but the roots had also extended, and the allowance of water given each time was increased in proportion. The difference, therefore, did not arise from the increase of evaporating surface, but from the external drought. We have the atmosphere of our houses under control to a certain extent, but not so much so as would appear at first sight. We must ventilate, and if when we ventilate the external air only contains two-thirds of its average amount of moisture, as was shown by the tables given in "our Journal" to be the case for a time, there must immediately be a great rush of the moist air from the interior of our houses. When this is known to be the case, and the supply of water and labour is unlimited, no great evil follows; but many, alas! during the past season have found themselves deficient of both water and labour.

It is surprising how little is the cost of pipes, taps, and hose, compared with that of the labour annually wasted in carrying water a distance by hand. The amount of wages paid to those who carry the water is not all that should be taken into account. The watering has generally to be done, and is seldom done efficiently when there is a great pressure of other work and time is doubly valuable. I have known a case where an efficient supply of water was laid on for less than it previously cost every year to carry what was not a tenth part of a sufficiency. Where a natural flow of water cannot be conducted to the desired spot, a hydraulic ram, a water-wheel, even a steam pump is cheaper in the long run compared with manual labour, its consequent wear and tear and insufficient watering.

To ascertain when the soil requires water, I dig down 18 inches or so with a trowel or stick, take a portion of the

soil in my hand and squeeze it together. If it binds, water is not required; if it refuses to bind it requires water, or, at least, very soon will do so. This method will not do for those whose borders are principally composed of bricks and mortar; mine are made with loam and a few broken bones. Of course, it is a very rude method, but it is the best I know of present. I want our scientific friends to help us to a better one. Another reason for requiring some instrument as a telltale is, that one must often trust to his subordinates' love of work as to whether the stipulated quantity of water is given. I personally have never found any difficulty in this way, but such a thing might occur.

It is generally recommended not to water Vines after the Grapes commence colouring, and as a rule this is sound advice. There are times, however, when this rule must be departed from. If a quantity of healthy foliage remains on the Vines after the fruit is ripe and the weather is bright, the border may get too dry and the Grapes will begin to shrivel. Immediately on the first appearance of shrivelling the border should be examined, and if found dry, a bright clear day should be chosen, when some of the driest surface soil should be taken off and laid in heaps, the necessary quantity of water applied, and the dry soil returned to its place. All this should be done while there is abundance of air on the house. No part that is watered should be left uncovered at night, and then if the top soil is dust-dry, no damp whatever will rise through it. If the lower eyes on the laterals have become brown, no harm will be done by shortening the laterals considerably, which will diminish the evaporating surface and lessen the probability of the border requiring water again till the fruit is gathered.—WM. TAYLOR.

LIFTING AND ROOT-PRUNING FRUIT TREES.

No. 5.

PEACH FAILURES.

It is really wonderful to note what an alteration has taken place in the views of horticulturists since we have had cheap glass. How well the thing can be made to work in the hand of the freetrader as compared with it in that of the monopolist! Glass has become the monopolist. Even Cabbages are long will not be thought delicate-eating unless grown under it. Glass monopolises our ideas entirely. The young aspirant of the blue apron considers subjects outdoors as beneath his dignity, worth knowing only by labourers. He is sure to pass with honours, if only his tuition be under glass; and the old finds what he had grown to such perfection outdoors is accomplished under glass with increased certainty and greater comfort to himself. Upon the introduction of orchard houses we were to have a crop without fail every year, to heat them was quite unnecessary; but now we find the upholders of the system advocating the very thing pointed out as resultant from experience—the heating of them if crops are to be had with certainty, not only in cold high positions, but in the most favoured. Glass, then, as a protective material for the cultivation of the Peach and Nectarine, is not superior to a south wall with the usual means of protection. Failures occur occasionally—as often with one as the other, and because these occur we are asked to believe in a theory that explains only truth away. It is said our climate has suffered a diminution of temperature; Peaches cannot be grown against walls nor in unheated houses without loss of crop in an unpropitious season, omitting to state the fact that they never were grown without occasional failure by such means. The climate, not man, is at fault.

Since the introduction of cheap glass a great stimulus has been given to the cultivation of fruits. The outdoor culture of the most tender kinds has been neglected, and the sole cause and reason of Peaches not being grown so well on walls now as formerly is conveyed in that one word "neglect." I know it is a word that few like to have applied to themselves, but what other word in our vocabulary is so suited to the occasion, or can enable a correct explanation to be given of why we cannot as successfully grow Peaches on walls in the latter half of the nineteenth century as the first half? Failures there always were since I can remember; failures we have now, but have we no successes? Look about and see if there are no places where Peaches are not grown on walls, and if there are any places where Peaches thrive in unheated houses and not on walls with protection, why by all means record the fact. A protected wall is, in my opinion, every whit as good as an unheated house, and not nearly so costly in after-attention.

Some years ago orchard houses were to supersede walls en-

tirely. Peaches were to be grown in unheated houses, but in the course of a few years the houses were found altogether useless for the purpose unless they had means of affording artificial heat; in fact, we find not unfrequently that Peaches are grown by themselves, separated from the Plums, &c., which everybody knows are hardier subjects; indeed, if Peaches could be grown in a house with Apricots, Plums, Pears, and Cherries, it is manifest the Peach could not be nearly so tender as it was considered, and we must have erred in treating it to the best aspect, and protecting its blossoms and young fruit in spring and early summer. If it can be grown in an unheated house along with Plums, Pears, and Cherries, it certainly ought to succeed in similar positions with these outdoors. The only thing we have gleaned from the orchard-house culture of the Peach is a confirmation of the fact known more than a century past—viz., that it is now, as then, a tender exotic, requiring for its cultivation in our climate the best of aspects, shelter natural or artificial, or both, with protection for its blossom, its young fruits, and tender growths. Anything short of this means failure—disappointment by loss of crop. If our climate be such as to insure the growth of the tree, the perfecting of its bloom buds, their expansion in spring, and if efficient protection be given the blossom, young fruit, and growth, the crop ripening-off late in summer, what more do we need to convince us the climate is not unfavourable save in spring, and that Peach-culture outdoors is not the difficult matter it is represented to be?

Now I have grown Peaches against walls successfully. I have had them fail both in an unheated house and against walls, just as the climatic conditions were favourable or the contrary. The last four seasons I have made an attempt at their culture on a south wall upwards of 500 feet above the sea. I was told it was of no use in this climate; even in houses fire heat was necessary in spring to bring them forward, and in autumn to ripen the fruit and wood. Well, I thought to try Peaches upon a wall 200 feet long, but considering discretion the better part of valour, planted four trees only, the rest were Pears and Plums, alternating the Peaches with Pears. They were not protected from the day of planting to this; and last season, as also this, two trees bore a few very fine fruits ripening in September. The kinds are Noblesse, Violette Hâtive, and Malta Peaches, and Violette Hâtive Nectarine; and the kinds which bore were Violette Hâtive and Noblesse Peaches, the others not having fruited. The growths were very rampant and did not ripen, so that in lifting last autumn the roots were found away from the stem, and one-half the young wood of the previous year died back nearly its whole length. I had an opportunity of comparing their doings with over twenty kinds of Peaches and Nectarines grown under glass with heat. Those under glass have, of course, given more scores of fruit than the others have single fruits. No one could expect a different result from the trees under glass; but the outdoor trees convinced me that Peaches may be cultivated successfully without glass, which, if the wall be not covered with glass as contemplated, I trust to demonstrate more decidedly by using a firm soil and protecting them, instead of trusting them to the chances of the weather. My object was so far accomplished. Peaches unaided will, against a south wall in 54° 30' north latitude and 0° 50' west longitude, at 500 feet above the sea level, for two years consecutively ripen perfectly. The soil is not suitable for the Peach; it is a light and porous moory peat soil, heath and whin being the indigenous vegetation of the open country.

The Peach being not upon its own roots, how are we to reconcile ourselves to the dictum of a strong soil for the Peach and Nectarine, and a lighter one, even sandy and calcareous, for the Plum and Apricot? All are on the Plum stock. Surely the Plum roots are the same in any soil. Not at all. In a light soil they have greater freedom of penetration and extension. If it be poor and dry the growth of the head will be weak and productive of bloom, but not of fruit, for profusion of bloom and of fruit do not necessarily go together. If the soil be open and rich the growth will be strong, and the blossom and fruit, until the vigour of the tree is overcome by age, will be remarkable only by paucity and small size. Consolidate the soil, and the resistance it presents to the extension of the roots will cause them to branch and permeate through it more slowly and thoroughly, and the head will be stouter, shorter-jointed in growth, have denser foliage, and be more fruitful. This constitutes the chief difference between a strong soil for the Peach and a light one. The latter is as good as the former if it is rich and firm, so that the growths are short and stout,

and moisture is forthcoming when required. A light and poor soil means enfeebled growth and poor mealy fruit; a light and rich soil secures long thin, or if moist, long sappy growth, its attendant mildew and failure of crop; firm, light, rich soil gives fruitfulness, vigorous, but healthy, well-ripened growths of wood and fruit. A firm soil is therefore required for the Peach, but it need not of necessity be heavy, only if light soil be used it must be rich in humus-affording agents. A strong loam with an admixture of marl is unquestionably the best soil for Peaches. Then we have to consider the difference in the growth of the Peach, Apricot, and Plum. The Apricot and Plum produce their fruit for the most part upon spurs—short stubby shoots, but the Peach does so only sparsely and indifferently, the best fruits on bushes or pyramids and standards being borne on the stiff short-jointed shoots of 7 to 9 inches in length, that of the spurs being comparatively poor, whilst the spurs are short-lived. This difference in the growths causes the Plum and Apricot to succeed in a soil lighter and more open than the Peach requires to have it fruitful and healthy.—G. ABBEY.

NOVELTIES IN THE ROYAL GARDENS, KEW.

On the rockwork we have chiefly to remark a new *Lobelia*, which, unlike the most familiar members of this genus, delights with prettiness of leaf, while its flowers afford but a sorry display. We allude to *L. subnuda*, an acquisition recently obtained by Mr. W. Thompson, of Ipswich, in whose collection of novelties for next year we may expect to see it. The leaves arrange themselves in a neat tuft, and on the upper surface have a velvety appearance, dark in colour, but veined with green, which imparts to the plant its most attractive feature; underneath they are of a uniform purple. In outline they are ovate, with large serrations; the blade measures rather less than 1 inch from base to apex, and the petiole in length is rather more. The flowers are small and pale blue, borne rather widely apart on erect stems. It is a native of Mexico. *Pentstemon antirrhinoides* is very distinct, inclined to be of shrubby habit, with short yellow flowers, recalling the *Impatiens* repens. The flowers are unfortunately not very numerous. The leaves are small. *Parochetus communis* is one of the prettiest of trailing plants, with its fresh green trifoliate leaves, like some kind of Clover, and brilliant blue flowers, not quite so large as the Pea, but similar in shape.

In the herbaceous ground the Asters have been lately the chief point of interest. *A. pendulus* is the best now in flower; the capitula are white and rose; it grows about 40 feet high. *A. puniceus* is also good; the flowers are white, and the leaves of a much lighter shade than is usual. When planting Asters it is necessary to give plenty of room, as they otherwise quickly run into each other, or smother other things.

Fouquieria undulata, an uncommon species, is flowering in the Succulent house. It has never yet been figured. The leaves are dark green with brown spines, and spreading with less rigidity than is common to the genus. The scape is about 6 feet high, though from a stronger plant it would doubtless be taller. The flowers closely resemble those of other kinds; indeed it appears that there is very little variation in this respect in the genus, so that the leaves must be largely relied on for distinctive characters.

Cuscuta reflexa, one of the Dodders, flowering in the Cape house, deserves mention. The stems are very numerous, and about which are freely strewn the white bell-shaped flowers. It apparently grows on anything. It is now doing well on *Pelargonium*: on *Mesembryanthemum*, Ivy, and *Gnaphalium* it has also been cultivated. To increase, it is only necessary to place near it the plant on which it is intended to grow. It is indigenous to the Coromandel coast, but requires no higher than greenhouse temperature.

POTATO PLANTING.

I HAVE been a Potato-grower for many years, and have never had so fine a crop as this season. I have changed my method of cultivation, and my plan was this:—To plant upon the piece of land soon after the other kinds of crops were off, giving a sowing of ashes and soot mixed well together and forked-in, and turning over again in the spring as soon as the weather permitted, and again at planting time. About one bushel of soot to six bushels of coal or wood ashes mixed well together is the proportion used, and sown 1 inch thick or more. Begin forking so that the first row will be 1 foot 2 inches from

the outside (the half width of the rows, which are 2 feet 4 inches apart), the plants 1 foot 3 inches apart, and continue digging with the fork about 2 feet, and the plants will be dibbled-in without treading on the planted ground. As my Potatoes were very large this year, some 7 inches long, I intend to lay the ridges more round in moulding-up, as some of the largest Potatoes were out of the ground and turned green; these were nearly all sound. They were a red-skinned Kidney, and grown without any manure.—H. HATLEY, *Saffron Walden, Essex.*

ORCHIDS AND FINE-FOLIAGED PLANTS AT PROVOST RUSSELL'S, FALKIRK, N.B.

A FEW weeks ago I had occasion to write of this ancient and celebrated burgh as the place where the *Auricula* had found a home, and had been tenderly nurtured for many generations. It must not be implied from this that the culture of what are called florists' flowers is the only branch of the gentle science that flourishes here. Rising from the lowly alpine gem to the aristocratic Orchid, of the latter, not even in the world-renowned Meadowbank collection in its palmiest days could better examples of skilful culture be seen than at this place under the care of Mr. Sorley.

It is in the house devoted to the culture of the various species of Orchids requiring an East Indian temperature that the best examples are to be seen. This is a span-roofed structure fitted with staging round the sides and a platform in the centre. The sides are of glass, elevated sufficiently to bring the plants up close to the glass without their coming in contact with it, or being so close that they might suffer in severe weather from fluctuations of temperature. The most striking objects in the house are the *Cypripediums*. *C. Lowei* and *C. Stonei* are represented by marvellous specimens, which have attained such proportions under Mr. Sorley's care. They are grown in the ordinary compost—viz., turfy peat, sphagnum, and broken pots. It is certainly not in the potting material that the secret of success lies, nor is it in the construction of the house, which is admirably adapted for the purpose, but not more so than many other houses. The secret is in the fact of the plants being under the care of a man who not only thoroughly understands their requirements, but has so much love for his plants that their wants as to watering, shading, syringing, &c., are seen to just at the right time. *Cypripediums* require rather different treatment from that accorded to many other members of the Orchid family. The compost should not become so dry as that for *Cattleyas* and allied species, and the plants may be syringed with advantage every day during the summer months. *C. candidum*, *C. Dayanum*, *C. Veitchii*, and *C. Schlimii* are also well managed. *Lælia elegans* *Schilleriana* and *L. elegans* *Turnerii* are the two best forms of the species; the growths were very strong indeed. So were those of *Saccolabium præmorsum* and *S. Blumei* *Russellianum*; of the latter I saw the spike fully 2 feet in length. *Dendrobium triadenium* was here in full beauty, the variety being very fine; the flowers were not pure white, being suffused with a delicate blush. This is very useful for bouquets and flowers at a time when choice flowers are not plentiful.

Passing to the *Cattleya* house some noteworthy specimens are also to be found. *Odontoglossum citroszum* *roseum*, a fine variety, does well in this house. I noticed a fine plant, which Mr. Sorley informed me produced twenty-five flowers on one spike. The best varieties of *O. citroszum* are not at all inferior to those of *O. crispum*. The treatment is different; the first-named luxuriates in a temperature of 55° in winter, while the latter does best in one 10° lower. There were fine forms of *Cattleya Warnerii* and *C. labiata*, but the best varieties of *C. Trianae* were said to be superior to the others. It has been alleged by some who ought to know that the flowers of this New Grenadan species are not so lasting as those of some of the others, and a long discussion was carried on in a contemporary about this short duration of the flowers. Mr. Sorley pointed out a plant to me that had been in flower for two months. Would any other species last longer than this?

Let us just look into the *Odontoglossum* house; here are the best of the Alpine Orchids, for which the uplands of New Granada and the Peruvian Andes have been explored. The best plant of that curious but rather pretty Orchid I have ever seen is here, *Colax ingosus*. The plant had four spikes, furnished with fourteen flowers; the sepals of these are prettily spotted. *Odontoglossum Kramerii* is not very common, and is almost a perpetual-flowering species. *O. Italii* is distinct and

handsome; so is *O. triumphans*, which succeeds with the coolest treatment and plenty of moisture at the roots. Of course *O. crispum* was plentiful, and some nice specimens of *Masdevallia Harryana* served to light up with its brilliant inflorescence the more sombre colours of the *Odontoglossums*. *M. tovarensis* is also a most charming winter-flowering species; the flowers are of the most delicate transparent white, freely produced; one and two-flowered. At one time the culture of the coolest section of *Odontoglossums* and *Masdevallias* was very imperfectly understood, the temperature in which they were grown being kept too high, and the plants too freely exposed to the sun. To grow them well they must be shaded from the sun, and the temperature kept as low as possible during the summer months. No artificial heat is required from early in May until October, unless a frosty night should occur in the interim. In winter the maximum temperature should rise as nearly as possible to 55°, and the minimum be 45°. It is not desirable keep to the roots continually in a kind of marsh, but overdryness either at the roots or in the atmosphere is more injurious to them.

Some noble specimens of Palms and Tree Ferns are accommodated in a large span-roofed stove and a lofty conservatory. In the former structure are fine examples of *Livistona Jenkensis*, one of the broad-leaved Fan Palms; there is also a fine example of *Seaforthia robusta*, synonymous with *Areca Baueri*; this and *Areca Verschaffeltii*, of which there is an equally fine specimen, are easily grown, seldom out of condition, and withal are the most useful species for general decorative purposes in cultivation, and what is not unimportant for many readers, they can be purchased at a cheap rate. *Calamus ovaliformis*, *C. dealbeatus*, and *Chamedorea graminifolia* are also fine useful Palms. In the large conservatory there is a handsome example of *Musa Ensete*, two of the most handsome specimens of *Dicksonia squarrosa* in the country, their trunks nearly 20 feet high; *Cyathea dealbata*, with fronds spreading 20 feet; and *Cyathea Smithii*, with an 8-foot stem. A fine specimen of *Zamia McKenii* sent up a flower spike last year, and after the singular inflorescence disappeared perfect seeds were produced, which appear to be thoroughly ripened.

Another long article might be written to describe the flower garden and the choice collection of coniferous trees. On the lawn many of the newest and rarest species are to be found of large size, healthy, and handsome in shape; but the whole garden is in excellent keeping, though I had the discomfort of seeing it in the proverbial Scotch mist. With the staff of men Mr. Sorley has at command he certainly produces great results.—J. DOUGLAS.

HARDY HERBACEOUS PLANTS.

I HAVE been more or less conversant with these for forty-eight years. Some of them are prized for their flowers and some for their foliage. I will name a few that are beautiful, and which I never saw till this season—*Yucca filamentosa variegata*; *Iris reticulata*, the prettiest spring flower I ever saw; and *Sempervivum arachnoideum*, or Cobweb Houseleek, a great beauty; this and the *Iris* took me more by surprise than any hardy plants I ever saw. But the *Yucca* is very dear—63s. for the plant I saw. The *Y. filamentosa* is a pretty plant, and I have known it for forty-eight years. I have two plants of it now, and I admire it for its foliage, and when it blooms it is very showy. I bought a plant this year of *Corydalis lutea*, and it occurs to me that it is far better for bedding out for a variety in a flower garden than the yellow *Calceolaria*; it is quite hardy, both flowers and foliage of it are pretty, and it stands sun and rain with impunity. The plant I have has bloomed all summer, and now it has hundreds of trusses of pretty yellow flowers on it, about eight flowers on each stem, and clear of the foliage. It is 1 foot high, and 5 feet in circumference. I saw the plant lately in the gardens at Dalkeith Park, and Mr. Dunn, the gardener, prized it very much. It is a native of England, about old walls. There is one in every respect the same, only the flowers are whitish, I think it will be *C. capnoides*. I saw it the other day in full flower at the Marquis of Lothian's, Newbattle Abbey.

If more attention were paid to many of our hardy spring and early-summer-flowering plants and to many of our beautiful shrubs, and we were to abolish to a large extent the masses of blue *Lobelia* and yellow *Calceolaria* that are planted in modern flower gardens, I think it would be a step in the right direction. It is quite a disgust to me to see so many yellow *Calceolarias*,

&c., in our flower gardens, while many far prettier flowers are not to be seen, such as Rollisson's Unique *Geranium*, *Saponaria calabrica*, *Nemophila insignis*, East Lothian Stocks, *Lotus jacobæus*, *Gladioli*, &c.—J. Addison, *Ormiston, Tranent, N.B.*

NEW BOOK.

Proverbial Folk-lore. By the Author of "Songs of Solace." Dorking: R. J. Clark. London: Simpkin, Marshall, & Co.

We never expected to see a book of proverbs printed and published at Dorking. A volume on the good old English fowls which thence derive their name would have been more anticipated; yet the volume before us records that the county gives birth to one proverb: "In Surrey is a saying suggestive of the extreme beauty of its hill and woodland scenery—

'In and out like a Surrey lane.'

while the town of Dorking, of good poultry association, supplies its spirited rifle corps with the denomination of "The Five Claws."

The author has discreetly omitted another Surrey proverb,

"The vale of Holmesdale
Was never won, never shall."

For it never was true if intended to assert it was never conquered; but if it means that it shall never be enclosed it is quite true.

We turned over the leaves of the volume, and read many of them in search of a reason why it could be sent for notice in our columns, and we came to some proverbs which justify it—

"A Cherry year
A merry year;
A Plum year,
A dunn year."

The author does not appreciate its meaning; but it is plain to those who know that Cherries are never plentiful except when their blossoms have a genial spring and summer; and that abundance of Plums causes an increase in the death rate. Another proverb—

"March winds and April showers
Usher in May flowers,"

calls forth this note from the author: "I may be permitted to give a warning against the false hopes which I cannot but think are excited by Dr. Watts when he speaks of the Rose as 'The glory of April and May.' This queen of the flowers can be hardly said to hold her drawing-rooms before June, and our earliest Rose shows are seldom before the last week of that month." Now, we will wager a broad acre of Holmesdale pasture to a foot's breadth of Brandon sand that that comment reveals the unnamed author of the volume. When we wandered about Deepdene and along Holmesdale we must have been near his rosery.

We pass on to a few more quotations—

"This rule in gardening never forget—
Sow dry and plant wet."

That requires in some years the exercise of one of the virtues enforced by another proverb: "With patience and packing even Medlars are made eatable."

We have others marked for quotation, but must conclude with this: "Young people used to be admonished that 'the early bird picks up the worm.' They now pertainly answer, 'What a fool the early worm was to come out so soon and get picked up.' This, however, is an instance of too hasty generalisation. On inquiry it will be found to have been the late worm, and not the early—the worm that would 'not go home till morning'—that got picked up; which makes our moral still more admirable."

In his dedication the author justly observes, "Wisdom and wit are no unworthy yokefellows," and proverbs are illustrations of the apothegm. There are said to be twenty thousand recorded European proverbs. We have an old volume before us of more than three hundred pages, with an average of nearly thirty proverbs on each page, and one of them is "Better half an egg than an empty shell," and it applies to the Dorking volume before us. It is small, but its contents are well selected and well arranged. The author's connecting remarks are apposite, terse, and wholesome, and worthy of proverbs which Bacon said are "the genius, wit, and wisdom of a nation."

KEW GARDENS AND PLEASURE GROUNDS.

Or the public gardens belonging to the capital towns of Europe I know none which for beauty and variety comes up to our own Kew. To all classes of society—to rich and poor, to

old and young, to the infirm and the robust, and to those long pent-up in one of the most populous and murky cities, Kew Gardens offer the means of enjoying within a small space country pleasure with objects of instruction and amusement suited to all tastes. It is a remarkable but pleasing feature of the times in which we live, that the public taste for such places should be on the increase, not merely in Britain but in

Europe generally. Public gardens have become indispensable to large cities and towns, and when properly kept, as Kew is, are not only delightful mediums for instruction in botanical science, but among the greatest of blessings that can be bestowed on a people, abounding as they do in objects of interest that generally make lasting impressions on the mind. Happily there are but few who, however little acquainted with botany,

are not more or less filled with admiration at the endless variety of forms presented by a considerable assemblage of the members of the vegetable kingdom—their grotesque trunks and tapering stems; their leaves, so varied in shape and beautiful in structure; their flowers, so curious in parts, so diversified in colour, and often so exquisitely fragrant; also by their wonderful adaptation to the use and gratification of man.

It is very pleasant to see how Londoners with their wives

and families on a fine summer day show their appreciation of the gardens at Kew, dispersing themselves in all directions, some rambling by the riverside under the shade of noble trees, and on secluded paths, stopping here and there at points of view bearing upon objects either natural or artificial. These walks carry the visitors to all the points of attraction, passing Roses, flowering shrubs of great beauty, rock plants, and herbaceous plants, judiciously grouped. In the hothouses you can take a glimpse of the vegetation of the tropics; then there are the

orangeries, ferneries, Cacti, Palms, and other plants too numerous to mention; but in summer the flower beds on each side of the principal walk and in front of the Palm house are the greatest attraction, and to them the gardens owe much of their beauty. The position of the beds is all that could be desired, and the plants are artistically disposed in different figures corresponding to one another, producing the most striking and ornamental effect. The brilliant colours of the flowers are relieved by the more sober tone of the fine-foliaged plants that are advantageously introduced in all directions, which is indispensable now that it is fashionable to intermingle foliage with flowers in groups or masses. A beautiful example of this is to be seen in the accompanying design (fig. 113), for they are disposed so as to correspond harmoniously.—N. COLE, *Kensington Gardens.*

KEEPING GRAPES THROUGH THE WINTER.

To preserve Grapes successfully on the Vines through the winter months, in the first place the crop should be rather on the light than the heavy side, the berries should be more severely thinned than in the case of summer Grapes, and they should be thoroughly well ripened by the end of September. Large bunches should be even more severely thinned than smaller bunches, which latter generally keep better than larger ones, because the air circulates more freely through the heart of them, and consequently damp is not so likely to settle about them. It is also of much importance that the foliage should be kept healthy as long after the Grapes are ripe as possible. Grapes grown in heavy damp soils are not so likely to keep well as in drier borders; and in localities where the autumn rainfall is heavy, it is advisable to protect the outside borders from rain before the Grapes are quite ripe, for Grapes ripened under the influence of wet borders do not keep so well. The inside border should not be damped in any way after the Grapes have commenced to colour, but a slight top-dressing of dry finely pulverised old Mushroom-bed dung should be spread over it, and allowed to become perfectly dry and remain so all winter. Not a pot plant requiring water should be allowed in the house. An equable temperature of from 45° to 50°, according to the weather, should be kept up by means of fire heat when necessary. Extra heat should be put into the pipes on fine days, and air put on at top and bottom to expel damp from the house. Avoid the practice of firing with a view of drying up damp on wet or foggy days. It has the effect of drawing a stream of moisture through the house, to be condensed on the surface of the berries, and cause them to damp. When such weather occurs, rather keep the ventilators shut, and keep a very slight warmth in the pipes. Grapes are now very successfully preserved by being cut before the dead of winter, after the Vines have shed their leaves, with a portion of wood attached to the bunch, which is inserted in bottles of water having a few pieces of charcoal in them, and ranged in rows in racks made for the purpose, in a dry room where the temperature can be steadily kept at about 40°. In this way they can be kept for many weeks; and where it is necessary to have plants stored in late vineries, it is much preferable to leaving the Grapes to take their chance along with them. Of course the flavour of the Grape is slightly deteriorated from imbibing part of the water; but it allows the vineries to be used for other purposes, and the Vines being pruned before there is any chance of their bleeding.—D. THOMSON (in *The Gardener*.)

THE LATE MR. BETTERIDGE.

I MORE that there are some readers of "our Journal" who will sympathise with me in my present unfortunate position. I am threatened with an action, not for manslaughter, but actual murder, and one correspondent evidently gloats over the idea of hanging a parson. The fact is that I have killed the wrong man; for in announcing the death of Mr. Betteridge it should have been, not Mr. James Betteridge of that ilk, but Mr. R. H. Betteridge. The information was given me by a friend, and as they were neither of them known to me personally, I made this blunder. What can I say but "*Mea culpa, mea mazima culpa!*"—D., *Deal.*

NEW HABITAT FOR ERICA MACKAYANA.—The only habitat for this rare Irish Heath was that at Craiggamore hill, and between that and Clifden. In August of the present year it was discovered in its most typical form not far from the newly-

built police station at Carna by that ind-fatigable and very successful explorer of the Irish flora, &c., Mr. A. G. More, of the Natural History Department, Royal Dublin Society. The rare *Erica ciliaris*, discovered at Craiggamore by Mr. Bergin in 1846, and again gathered between Clifden and Roundstone by Professor Balfour six years later, would seem in the interval since to have somehow altogether disappeared from these localities. Mr. More informs us that, at the same time as he discovered the new habitat for *E. Mackayana*, he made a minute search, as also did Professor Balfour and party, for *E. ciliaris*, but without success.—(*Irish Farmers' Gazette*.)

VIOLETS.

THE Violet is one of the most cherished of plants, and held in high estimation by all lovers of fragrant flowers. The colour too—blue, is one not overabundant at any time, and especially in the dullest half of the year. Being hardy, the flower is within the reach of all possessed of a few yards of ground; it is not very particular in its requirements, but thrives in towns as well as in the country, needing only shade, moisture, and moderately rich loamy soil.

The varieties are tolerably numerous, but with only three or four of them the pretty sweet-scented flowers may be secured from September to May, and in quantity proportionate to the number of plants and means. It is not practicable to have Violets with certainty during the winter from the open ground, but they will continue to produce their blooms more or less according to the mildness or severity of the weather. In a frost of a week's duration, the ground being covered with snow, blooms not being forthcoming outdoors, these may be had from plants in frames which are protected by mats from the severity of the weather. A narrow pit along the front of a greenhouse or other house, cold of course, but deriving some warmth from the house adjoining, and having a south aspect, will, with a mat over the lights, be found a desirable means of growing them, the plants being planted so as to have their leaves from 4 to 6 inches from the glass. The best time to plant them in frames or pits is the end of September, but it may be practised up to November, the plants being moved with balls of soil, and after planting well watered. They can hardly have too much air if frost and heavy rains be excluded; and about a fortnight after the plants are put in look over for yellow leaves, which at once remove, and a dusting of charcoal pounded small dusted over the plants, brushing the leaves afterwards with the hand so as to dislodge any charcoal that may have settled upon them, will be found useful in preventing mildew. Charcoal dust also improves the hue of the blooms, making it deeper.

By April the blooms from the plants in frames will be over; they are then taken up and divided, the crowns, having each nice roots are sorted, the strongest forming one lot, and the weakest the other. They are planted in rows a foot apart, and that distance from each other in the rows for such kinds as Czar and Victoria Regina, also Queen of Violets; but the Neapolitan and Double Russian (purple) and King of Violets are planted in rows a foot apart, and 9 inches from plant to plant. A north border is chosen, liberally manured, and leaf soil added, in which the roots of the Violet delight. They also prefer rather strong loam to a light and sandy one. After planting watering is duly attended to, and during summer weeds are kept down and runners cut off as they appear. I do not consider runners nearly so good for propagation as suckers, and do not keep them longer than time can be spared to remove them. Plants for outdoor flowering are treated in the same way, fresh plantations being made every year and the old destroyed. Young plants afford finer blooms than old ones, and, growing stronger, are not so liable to red spider. For avoiding this pest a few dressings of soot are the best means, with liberal waterings in dry weather. The soot may be applied every month from May to September.

The pot-culture of Violets I have abandoned, but those wishing to grow them in that way will find plants grown in the open air far superior to those kept in pots in frames if taken up in September or October with nice balls of soil, potted, and placed in a frame on ashes, duly watered, ventilated, and the yellow leaves removed, to be introduced to a light airy position in a greenhouse, and set on a cool bottom. The tree kinds are best for pot-culture, and those even are not so healthy kept in pots through the summer. Better plant out in spring, keeping off all suckers and other hindrances to a tree-like growth, and pot early in autumn. The Chinese Tree Violet (*Viola arborea*)

and its variety alba; Brandyana, with very sweet flowers, striped with white, rose colour, and blue, are distinct and good; King of Violets also making a good tree. The above are the best. I have had nice plants with stems or "trees" of the Double Blue, Double White, and Neapolitan varieties of *Viola odorata*, the only thing needed being to keep down runners and suckers.

The Violets I grow in frames and outdoors, and by which we have Violets from September to May, are—

The Czar, a strong-growing variety of Russian, and every way its superior, having larger, sweeter flowers, with longer footstalks. Single, dark blue.

Victoria Regina.—The foliage is deeper and more shining than The Czar, the leaves individually larger, less tall—in fact, they lie almost flat and near the ground; the flowers are half as large again, very deep purple, single, very sweet, the flower stalks being as long as The Czar. It is very free-flowering, and will displace The Czar with me as soon as I can increase the stock sufficiently. Upon the runners it flowers very freely, and affords a few flowers in summer, being a perpetual bloomer, but is finest in autumn and winter. It would, I think, form a fine tree, its leaves being semi-pendant.

White Russian (*Viola suavis alba*).—Single. This is very sweet, very free-flowering, and late with me, but has short footstalks. A white Victoria Regina is desirable.

The Single Blue Russian I have discarded, but it is very free-flowering and good.

Double Blue or Purple.—Dwarf and weak in growth, flower stems short, free-flowering, and rather late. Double White has been passed for better.

Queen of Violets.—Double, white, as large, almost, as a double-flowered Peach blossom; the flowers tipped with blue or violet, with longish footstalks, very sweet, and so abundantly produced that they do not all fully expand; they should be thinned, for no flower is, when fully developed, more beautiful. It blooms longer than many.

King of Violets.—Taller, rather stronger-growing than Double Purple; the flowers are also paler in colour, and it is not nearly so free in suckers or runners.

Neapolitan.—Double pale blue, or sky blue, pale green shining leaves, growth moderate, plant dwarf, but not so dwarf as Double Purple; very free-flowering, blooming a long time, flower stems of medium length. Deliciously scented—the sweetest and best of all Violets.

What is *Viola pedata* like? Are the flowers sweet? They are I know very large, if I remember rightly, and the leaves are deeply divided, the flowers pale blue. Is it a good grower? and at what time does it bloom? A single pale blue with a good long footstalk is worth having, but it must not lack fragrance, or it would be like a Rose without scent; few would care to know it by the name of Violet.—G. ABBEY.

STRAWBERRY CULTURE.

THE question is often put to a gardener by those little acquainted with the cultivation of the Strawberry, "What sort must I grow?" This is rather a puzzling question to answer, though the sorts grown by oneself may be everything that can be desired. If the information is given to anyone living close by, perhaps he may be able to grow the same kinds as yourself; if to one at a distance, and not knowing what kind of soil he has to deal with, it is best to be careful in giving advice, but let him get it from some practical hand nearer his residence.

I had an idea in my younger days that any kind of Strawberry grown in one place would succeed equally well in another, but such is not the case; and it appears from recent correspondence in the Journal each gardener claims to have the best sorts. I have come to the conclusion after trying various kinds, and some of them with me very indifferent, that it is not just to the raiser for any one individual to condemn any sort not coming up to his expectations. I bought a few plants of Eclipse to get runners for forcing, it being praised in the catalogues for that purpose. I had crowns large enough for anyone to admire, and expected to have something good in return, but am sorry to state they were a failure, and the plants outside the same. If I were to say this kind is of no good it would be going too far. Many like it for forcing, and a friend of mine who has strong clay to contend with gets an excellent crop from it. Admiral Dundas, Sir Joseph Paxton, and Eleanor I could not get to bear fruit up to the mark, and I could name one or two; but this is sufficient to show it would not do for me to say they are worthless, knowing them to be excellent in many places. I settled down some time since to Dr. Hogg and President. In my dry soil they are everything that can be desired. Princess Alice Maud does well, also Keens' Seedling.

President I consider first-rate for forcing. Your correspondent Mr. Taylor failed with the latter in strong soil; has he tried runners for forcing since planting them in lighter soil?

I always obtain the finest fruit from plants two and three years old; after that time the fruit is smaller. I may also add to these few remarks that I can secure very good crops of fruit from President, planting them out after being forced.—M. B.

SEA-KALE CULTURE.

As the commencement of the Sea-kale year is at hand, a few notes on this vegetable may be useful. Sea-kale, like many other kitchen-garden crops, will not succeed on every soil without some trouble in preparing the ground; but if my directions be followed the failures will be few.

In settling upon a piece of ground to be cropped with Sea-kale in the following year, let it be freely exposed to the sun, as the more the sun can get at the leaves the better will they perform their work of storing up strength for future use. To give satisfaction when forced, be it a Vine or a Sea-kale crown, the plant should be well ripened. The size of the plot must be in accordance with the wants of the family; the quantity of Sea-kale likely to be wanted can be settled pretty well beforehand. Stretch a line, and every 3 feet wide nick the ground out with a spade one graft deep; then count how many widths there are in the piece; if even in number, then the soil can be put opposite the top of the last one; if odd, to the opposite corner. Here a word to young hands with the spade. Before ever taking out soil for a trench, be it one spit or two, if there are any weeds skim them off first, and do the same in the place the soil is wheeled to. By this precaution you will make sure of the weeds buried not cropping out in a week or two from the corner where you finish off. If two men start upon the piece their trenches will be required to be in different places if there is an odd number of widths.

The starting trench should be taken out 3 feet 6 inches long, two spits deep; the reason for the extra 6 inches is that owing to the soil being loose it does not build up quite straight, so that when the last trench came to be filled up the soil would be short. A two-spit trenching is for the majority of soils sufficient; but if it is desirable to go deeper, and the soil is of a bad nature, either wet clay or very poor, it is not advisable to bring it to the top on the first trenching, but to turn it over with a digging fork, breaking it up, and leaving it at the bottom. On this spread a good dressing of manure not too much decayed; or if manure is not to be had in unlimited quantity, there is nothing better than the rubbish heap, which should be kept for this purpose—sweepings of walks, leaves, cabbage stumps, weeds, not seeding ones, in fact all the rubbish that will accumulate in a garden. After a 6-inch layer of this turn the top spit on it, then a good dressing of manure well decayed, then the bottom spit upon it, at the same time throwing it up so as to form a ridge. By so doing the ground lies drier, and is more exposed to the action of frost.

Leaving the ground to mellow all winter, we will now turn to the plants. Those who have roots growing should, as soon as the foliage is dead, take them up carefully with a fork, picking-out every bit of root, for if not wanted the bits would only be troublesome in the following year. Having taken up the roots, dress them all off to straight pieces 6 or 7 inches below the crown. Select all the roots that are thicker than a pipe stem if the stock is low—if there are plenty, those of the thickness of the middle finger are better; taking the best first, with a sharp knife cut each straight off at the thickest end, and at 5, 6, or 7 inches as the stock will allow. Cut in a slanting direction, by so doing you will have an easy mark to tell the right way up, not easy otherwise, as the difference in diameter in the 6-inch length of root is sometimes very trifling.

Having made the required quantity of sets, place them in sandy or any nice light soil, as siftings from under the potting bench, in a turf pit or any dry sheltered corner out of doors, where they can have some litter thrown over them in frosty weather. Plant them in lines, keeping the strongest all together, and 2 inches below the surface. Here they will remain till the beginning of March; by this time they will have begun to root, so that any that are dead or doubtful can be rejected, thus preventing blanks. The ground should now be forked down and levelled; mark out rows 2 feet apart, and take out trenches with the spade deeply enough for the cuttings to be placed 1 inch below the ground level, allowing them from 10 to 12 inches apart in the row, and if the cuttings are small less room between each two. By keeping the top of the cutting

below the surface there will be little need for thinning-out crowns; some may push two and three, but let these remain, as in ground treated as above they will perfect three strong crowns. I have tried the dibber, but like the spade best, as it leaves the ground in better order, particularly if it is of a heavy nature.

Those who have not a stock to start with should order one-year-old seedlings from the nursery, cut off their heads, and make cuttings of them. A few years ago I was short, not having two dozen roots to start with, so I ordered a quantity of roots and planted them. I had to wait two years more for them before they were fit for forcing. The year following, or rather the spring following, I sowed some seed, and in November dug them up, made cuttings of them, and had fine roots for forcing the next season. Those that have a wet heavy soil know full well that Sea-kale will decay quite as fast as it grows, if it must remain two or three years in the ground. By adopting the routine described above the Sea-kale never stays in the ground all winter; the cuttings certainly do, but they are extra well cared for.

The summer culture consists in hoeing and keeping clear from weeds. When growing freely, towards the end of July give a watering with guano if the weather is dry, if wet sprinkle the guano over the surface. Never let the roots be exposed to drying winds, but as soon as dug up dress the crowns for forcing, make the roots into cuttings, and put them away in their respective places; all that is dried out of them is so much strength wasted.

The forcing of Sea-kale is a simple matter. The main point being darkness, light should be guarded against, as the least amount will render it tough and unpleasant. Those who have a regular Mushroom house need nothing further. Those who have a warm cellar could have nothing better. The best place that I ever saw for either Sea-kale or Rhubarb forcing was a cellar attached to a stovehole. Gas was laid on, so that the striking of a match at once furnished light that was equal to daylight, for the purpose of watering and cutting. The cellar was divided by a path up the centre; on one side was a bed of Rhubarb, and the other Sea-kale. The bed was 3 feet 6 inches wide, and the crowns were put in 3 inches apart and six in the row. The bed was made-up in November, as soon as they were lifted from out of doors, and the temperature of the cellar not being very high, the plants did not furnish any cuttings till the middle of January, but kept-up a constant supply for nine or ten weeks, as the crowns did not push all together, and the low temperature brought on the second cutting so gradually that it was little inferior to the first. Another bed was made-up in January to succeed the first, the crowns having been packed in sand out of doors till wanted. The two beds thus furnished a supply as long as Sea-kale was asked for. Contrast this with forcing out of doors with hot dung and leaves, going out on a cold frosty morning when there might be 6 or 8 inches of snow on the ground, kneeling on it or on wet manure, and having to shift a cartload of manure before getting the required quantity of shoots; it being of little use to put manure around the pot if it must be on the top as well, and be removed every time you wish either to look at or cut the Sea-kale.

Everyone, however, has not such a place, myself included, and my own way may be of service to some. For Christmas cutting I place some of the strongest crowns in 12-inch pots early in November. On these, after having well watered with warm water, I invert another 12-inch pot, and stop up the drainage-hole and any other crevice to exclude the light, and place on the top of the boiler in the stovehole. Here the roots must be carefully watched for water, as the heat is of such a dry nature.

For my main crops I use old wine casks filled half full of soil, the crowns inserted to their level. I use soil that has been once employed for potting. Such soil as *Pelargoniums* have been growing in is excellent if mixed with soil from Melon and Cucumber beds. Some have plenty of turf to cut at, and can afford to use fresh soil for anything. Not so here; sods are not to be had for asking. After having been filled, the casks are stacked upon one another in a back shed. We take one out at a time, place it on the boiler, and when the shoots are of sufficient length they are taken into a cool shed, where they come on slowly, and afterwards furnish second cuttings. When there is plenty in beforehand I do not let them remain on the boiler longer than just to start them. The last lot will start naturally, and come on fast enough.

For very late supply it is best to put out some crowns in

the frame ground, or any other convenient place, in clusters, covering them 3 inches deep with ashes, and inverting a pot over them—a Sea-kale pot with a lid being a great deal handier than common flower pots. These, without any covering, will furnish a late supply, care being taken to exclude light. Whenever in a hurry to get Sea-kale ready for cutting, use warm water. I have repeatedly used it over 90°, a dose or two never failing to start the roots.—W.

CARCLEW, CORNWALL.—No. 2.

THE RESIDENCE OF COLONEL TREMAYNE.

ASCENDING to the second garden, which was in some degree a counterpart of the first, we find ourselves amongst a class of shrubs and trees elsewhere only met with in similar condition under glass. Below and at one side of these geometric gardens the ground has been allowed to retain its natural outline, and the slope, intersected by suitable walks, is overgrown in places with noble trees and shrubs. *Rhododendrons* of all kinds seem quite at home, even including some of the Sikkim and Himalayan ones; and the same may be said of the *Camellia* and Indian *Azalea*, noble examples of which were every now and then to be met with; while the *Bambusas* formed growths from which very good fishing-rods were made. One was shown me quite 15 feet long. A *Loquat* tree, *Eriobotrya japonica*, was 10 feet high, as much through, and in the most robust health. The same may be said of *Eseallonia pterocladon* quite 15 feet high, having white flowers, and more tree-like in character than the other species. The singular *Colletia bicloniensi* was also here in the shape of a dense bush quite 7 feet in diameter; and there were specimens of *Fabiana imbricata* quite as large. I find I have omitted to notice a fine mass of *Hedychium flavum* or *flavescens*, which to all appearance had not been disturbed for many years, and was flowering most abundantly. This plant, I ought to say, was growing in front of one of the plant houses, and not in the shrubbery with the *Loquat*. I noticed a *Rhododendron* of the true arboreum section, or one very near akin to it, with a clear hole more than 6 feet high without a branch, and stout enough to form a gate post for a carriage road. Others of the *Smithii* type were equally large, and many of the Sikkim species seemed equally at home. *R. Thomsoni* was pointed out to me as being very fine. The general character of the place must be extremely rich at the time these shrubs are in flower, and when it is understood that some of them flower in winter accompanied by *Camellias*, the effect must be gorgeous. Intermixed with these *Rhododendrons*, &c., were *Magnolias* of the deciduous class, assuming the character of timber trees, and there was no lack of flowers on open standard trees of *M. grandiflora* at the time of my visit (September 1st). There was also an *Aesculus* of a class not generally known, said to be very fine; while underneath, creeping over rugged stonework, were dense masses of *Gaultheria Salloni*; and a tall half-shrub-looking plant, *Polygonatum Sieboldii*, was completely covered with its white inflorescence. I understood it to be herbaceous, although it was quite 8 feet high and as much in diameter. *Pampas Grass*, *Camellias*, and Indian *Azaleas* were noticeable everywhere, and in all manner of sites. A pretty *Hypericum*, *H. oblongifolium*, had just gone out of bloom, while *Pernettya mucronata* was still in flower and gave promise of producing a quantity of its fine magenta-coloured berries; there were trees of it quite 10 feet high. A fine *Rhododendron cinnamomeum* was of the same height; the under sides of its leaves are of a rich brown, and its flowers are said to be magnificent. There were also *Azaleas* of the *Indica* type quite 10 feet high and more than that in diameter. *Sparmannia africana*, ordinarily a greenhouse plant, had stood for years out of doors. Part of these as well as most of the following were growing in what is called the Pond Garden, a sloping shrubbery running down to a pond.

Amongst other trees and shrubs at this place was a fine *Abies Douglasii* from 65 to 70 feet high, and upwards of 8 feet in circumference at 5 feet up; and in reference to the height of this and other *Conifers*, I may mention, that when any tree seems to overtop its neighbours in this part of Cornwall its top is immediately cut by the wind, so that the tops of this and other tall-growing *Conifers* had an injured and shabby appearance compared with the parts below; and as the great bulk of the sheltering trees were Oaks, the aspect of woods, even when extensive, was in exact conformity with the ground, otherwise such trees as the Douglas Pine mentioned above

and Pinus Morinda and others would have been much taller; but as it was, the latter was from 65 to 70 feet high, and 5 feet 9 inches in circumference at 5 feet up. Pinus patula, a fine long-leaved species, was upwards of 30 feet high, and the spread of its branches attained a circumference of upwards of 120 feet, and its trunk was 6 feet at the usual height of 5 feet up; a fine specimen. Salisburia adiantifolia, 40 feet high. Cedrus Deodara also 40 feet, with not so much of the propensity to merge into the Lebanon type as is manifested in some places. A deciduous Cypress was 30 feet high, while an Oriental Plane was 70 to 75 feet high, with a girth of 12 feet—a fine tree, yet not more so than a venerable Silver Fir growing in a rather low situation, that was from 85 to 90 feet high with probably 15 feet or more gone from the top of it. This had also a girth of bole at the ordinary height of 5 feet of nearly 10 feet. Magnolia tripetala, 35 feet high, had a fine head. Intermixed with the above or adjoining were plants of Rhododendrons of the true arboreum and Smithii section attaining the proportion of trees. One fine one I noticed, and was told by Mr. Palmer that it was 24 feet high, with a stem nearly 4 feet in circumference; while a more bushy specimen of the same kind had a circumference of head of 55 feet, and a height of 12 feet. Other crimson varieties were from 18 to 20 feet high; also R. Falconeri, Aucklandii, campanulatum, Maddenii, &c.

Interspersed were Phormium tenax, 7 feet high and as much through; Bamboos 18 feet high; and the Snowdrop Tree, Halesia tetraptera, that had the appearance of having been beheaded by the wind, but had a stem of 4 feet 6 inches in girth, and bloomed freely. That useful Cape plant, Agapanthus umbellatus, seemed as much at home as the native Grasses. Berberis nepalensis, a specimen not often met with, and differing widely from the japonica or Fortuni section, was also in a flourishing condition 10 feet high; while a Lucombe Oak adjoining the fernery was about 65 feet high, and with a stem of 9 feet 6 inches in circumference. In another place Chimonanthus fragrans formed a fair-sized tree, and Cotoneaster frigidula approached the same proportions, being 25 feet high and nearly as much through. Ever and anon the eye rested on some noble specimen of choice or well-grown Ferns, Lomaria magellanica being quite at home, as much so as Osmunda regalis, of which specimens rivalling in size many Laurel bushes, were to be met with; and now and then a tropical character was given to the picture by fine specimens upwards of 8 feet high of Dracæna indivisa, which, I was informed, flowered annually, and had stood out several winters. Yucca recurva was also present, and a species of Leptospermum was upwards of 8 feet high and nearly as much through. Accompanying these were fine plants of Azalea indica alba; and Gunnera scabra, so often employed in flower gardens where striking foliage is wanted.

Embothrium coccineum was said to be a mass of scarlet when it is in flower, and near to the same place were some good examples of Pinuses, P. patula being very fine; while Abies Kämpferii was still more remarkable, being 18 feet high and 14 feet through, healthy and vigorous. In many places it is only with difficulty that it can be kept alive; I think we have one here (Linton Park), that has been planted some eight or ten years, and certainly it has not grown more than as many inches, but at Carelev the tree is as robust as a Douglas Fir.

In the pinetum proper are Deodars showing a less tendency to merge into the Lebanon type of Cedars than others do elsewhere; P. insignis, of timber size; the pretty Abies Bruniana, with its Fern like foliage, that will hardly attain the dimensions of a large tree. Not so, however, Abies Alberti, which promises to equal Taxodium sempervirens in size, while excelling it in rapidity of growth, as one here was not much short of 20 feet high; Taxus adpressa, a very dark-foliaged species, about 10 feet high, not having been planted many years; and even the rarely-to-be-met-with Umbrella Pine of Japan, Sciadopitys verticillata, was in a healthy and promising condition, although it had not been planted many years; it had, however, as well as everything else previously mentioned, proved quite hardy, and was clothed with its fine tropical-looking foliage all over. Perhaps, however, a more promising tree is the New Zealand Dacrydium with its dense broad head of a dark green colour. Still more likely to form tall fine trees were Thuopsis dolabrata and T. dolabrata variegata, both of which had, I think, attained the condition at which they start into upright growth, while all the Japan Retinosporas were doing well. Abies canadensis, the Hemlock Spruce, was 50 feet high, with a circumference of stem of about 3 feet; Cryptomeria

japonica, from 45 to 50 feet high and 5 feet in circumference of stem; while there were several promising plants of C. elegans upwards of 8 feet high, which assume the same bronze-coloured hue in Cornwall that they do elsewhere. Picea grandis, said to be true, measured 7 feet; Abies firma, a comparatively new species, 8 feet and promising; Abies orientalis, 25 feet high, and Picea Nordmanniana the same height and every way promising; Abies Menziesii, 50 feet high, with a stem 4 feet in circumference; Picea grandis, 36 feet high, and stem of 3 feet in girth; Araucaria imbricata, 35 feet high, but on the whole not so much at home as some of the other Conifers, more particularly Cupressus macrocarpa or Lambertiana, which was from 55 to 60 feet high, and with a stem 8 feet in circumference at the usual height; the Douglas Pine and Pinus insignis, the former 75 feet and the latter 70 feet high, with each a girth of nearly 8 feet of bole. Growing near to these fine specimens was a Cork tree of 40 feet high, and a specimen of deciduous Magnolia of the same height, and with a stem upwards of 4 feet in girth.

Some noble Oaks of the Lucombe variety deserve special notice; in fact these fine trees standing amongst others, common Oaks, a little way from the mansion would seem almost to excel them alike in the length of bole and its girth, as I find the following measurements kindly taken for me by Mr. Palmer testify. No. 1 from 75 to 80 feet high, and 9 feet 9 inches in circumference; No. 2, same height, and 10 feet in circumference; Nos. 3, 4, and 5 same height, and 12, 9 feet 8 inches, and 11 feet each respectively in circumference; while Nos. 6 and 7 were from 70 to 75 feet high, and 10 feet 6 inches and 9 feet respectively in girth; No. 8 being from 65 to 70 feet high, and 9 feet 3 inches in girth, the circumference in every case being taken at 4 or 5 feet up, and where no undue swelling increased the size; in fact these trees look almost as large at 30 or 40 feet up as where measured, and it is seldom we meet with such fine ones. The foliage does not begin to fall till January. Some very good specimens of Cupressus macrocarpa were also shown me, likewise others of the Hemlock Spruce and Taxodium sempervirens, the latter, as is the case everywhere, very promising. Eugenia apiculata was also good outside, its upright growth and clear evergreen foliage equalling that of a large Box tree. A fine Oak that partially shaded the fernery presented a bole of quite 40 feet without a branch, and was also of great thickness; while near to it was a cut-leaved Alder, Rhamnus alnifolia, a fine tree, as was also Abies Morinda or Smithiana, the latter rivalling the native Spruce in robust growth. The Magnolias were particularly fine, M. tripetala, Soulangeana, Thompsoni, and others being all good. To the lover of Ferns I may mention that on each side of the margin of an ornamental piece of water of an oblong shape were growing two of the finest plants of Osmunda that were perhaps ever seen, one being opposite the other, standing clear of everything, one of them at least in the full sun; yet they were as even a pair as could be wished for.

We now retrace our steps to the kitchen garden, and there find that Mr. Palmer has turned to good account a material which occurs abundantly in the neighbourhood—quartz or spar, broken pieces of which are used as an edging, and its white sparkling appearance has a good effect. The garden proper has perhaps a greater descent than might be wished; but in other respects it is correctly placed, and the glass houses are commodious. First of all I was shown into a stove, in which Orchids that required considerable heat were grown, but another house kept much cooler contained by far the most important collection. I noted a magnificent Alocasia metallica, a dense mass of foliage from 7 to 8 feet through, and too large to move to any show; it was growing in a large pot which had been further enlarged by a strong wire hoop surrounding the rim, by which means turf of a peaty nature was supported round this noble specimen. Anthurium regale was also good and large, as was that fashionable Fern, of which by far too much notice has been taken in my opinion, Adiantum farleyense. Maranta spathulata was also good, as was Pteris umbrosa.

Notable among the Orchids in the cool house was Disa grandiflora, a large plant, with six spikes of bloom upon each spike, having some half-dozen fully expanded blooms out at the time of my visit, with others to follow, and the flowers resembling large outdoor Frises, or rather the old Tigridia pavonia flowers. Mr. Palmer keeps the plant much cooler than is generally done, and had a mass of young plants standing in a cool frame over a pool of water. I hope he will give us all a lesson on the growth of this important plant, for it is sel-

dom seen as at Carclew. *Lasiandra macrantha*—not an Orchid, I need hardly remark—was subjected to a treatment different from what it generally gets elsewhere. Occupying a 10-inch pot, I understood it had been set out of doors to harden in the early part of the summer, and was afterwards brought in and placed against a wall, when it commenced to grow and flower, and at the time of my visit was a mass of flowers, equaling those of some of the violet Clematises, and occupying a space against the wall quite 12 feet high by 9 feet wide, its roots still confined to the 10-inch pot alluded to. Near it were some fine Palms, as *Seaforthia elegans*, *Sabal Blackburniana*, *Corypha australis*, and others, not omitting the general favourite *Latania borbonica*. *Adiantum rhomboideum* and *tenerum* were also at home, both of which are prettier objects than *A. farleyense*. We now come to some of the Orchids, and found the *Aërides* very good, *Angraecum eburneum* large and evidently at no distant time to be well covered with bloom, *Dendrobium pulchellum* in a basket very good, *D. Pierardi* in

much the same condition, *Cattleya crispa* in a pan 2 feet wide also very fine, *Brassavola Digbyana*, bright orange, while creeping on a sort of cork slab was the interesting *Sophranitis cernua*; in fact, Mr. Palmer had turned virgin cork to many useful purposes; and I may add for the information of intending Orchid-growers that he finds living moss a better medium to grow them in than dead. There are besides many noble specimens of exotic Ferns, with flowering and fine-foliated stove and greenhouse plants too numerous for separate mention.

On emerging from one of the houses I was struck by a plant often grown inside—*Hedychium Gardnerianum*, which was freely luxuriating, and from 6 and 8 feet high; I was told it stood the winter with the protection of some ashes. More hardy but not less beautiful were the Guernsey Lilies flowering in great profusion, and in less-favoured places *Fuchsias* of the white-sepalled class were vieing with the more hardy kinds in furnishing their quota of flowers to assist in the general display.

Fig. 114.—CARCLEW.

The Grape houses, in the course of being renovated, looked equally promising; and the contents of the kitchen garden presented the usual features of good cultivation. There were some excellent Peaches, very fine Pears, and good-looking Apples; but I incline to the opinion that better-flavoured Apples are grown nearer London, at the same time I should say the Cornish ones are the finer-looking. I cannot conclude this notice without alluding to what is an important matter in all garden establishments, and that is the gardener's cottage; in this instance Colonel Tremayne has built a very suitable one for Mr. Palmer, one far better than is usually erected by architects.—J. ROBSON.

DESCRIPTION OF THE VIEWS OF CARCLEW.

Fig. 111, page 384, illustrates a part of the pleasure ground. The trunk of the tree so prominent in the foreground is a Lucombe Oak, not the largest, but decidedly the handsomest. On rockwork to the left can be seen a fine mass of *Lomaria magellanica*; and on looking across the large bed of Camellias and Rhododendrons, an ancient Silver Fir that has been over 100 feet in height. Dotted around this on grass are seen fine bushes of Rhododendrons, &c., while on the right can be seen a portion of an ornamental pond. On a terrace some 25 feet higher than

this pond can be seen a block of glass erections, consisting of an Orchid house, plant stove, and intermediate house for flowering plants, &c. Still rising very rapidly can be seen something of the kitchen garden, the wall most conspicuous dividing the kitchen garden into two portions. The mass of foliage at the back of the houses is produced by a wooded shrubbery, the undergrowth being masses of *Rhododendron ponticum*.

Fig. 114 is taken from the end of the terrace next the kitchen garden. The garden with the fountain and basin in the centre is in front of a block of three houses; the garden is geometrical, consisting of twelve beds with borders at the sides, &c., on gravel, the beds edged with Box. The four beds through the centre in line with the basin are carpet-bedded; four others flanking the basin are all planted alike with Geraniums, Calceolarias, Perilla, and Lobelia. Outside these, and as it were surrounding them, are four other large beds, which are planted with herbaceous plants, &c., and a row of Dahlias down the centre. In front of the hothouse can be seen a mass of *Belladonna* Lily, Myrtle bushes, &c. Besides the Pampas Grasses, in the angles of four herbaceous beds stand *Colletia hicksoniensis* and *Hypericum oblongifolium*. In the fountain basin are *Limncharis Humboldtii*, and *Aponogeton distachyon*. The terrace above is also a geometrical garden of twenty-seven beds, with borders, on gravel, with Box edging, and planted miscellaneously with annuals, Violas, &c.;

the Violas, with a bed of *Lobelia cardinalis* St. Clair, being a great success. Behind the Pampas Grass, to the right can be seen the spreading head of *Pinus patula*.

The views have been engraved from photographs by Messrs. W. H. Dunstan & Co., 9, Berkeley Vale, Falmouth.

BUERRÉ DIEL PEARS GROWN AS ESPALIERS.—I have four trees 5 feet high in a row extending 9 yards. They were planted five years since. I have not had a crop off until now. To-day, October 15th, I have gathered 252 Pears, weighing 96 lbs. 9 ozs.; the largest weighed 12 ozs., about four dozen 10 ozs. each, six dozen 9 ozs. each, the remainder ranging from 8 ozs. to 2 ozs. each.—J. F. M., Nottingham.

NOTES AND GLEANINGS.

This is now the season when out doors and even in the conservatory the CHRYSANTHEMUM reigns supreme. In the Inner Temple Gardens there is an unparalleled display of bloom—one such as would have gladdened the heart of worthy old Broome, and one of which his more youthful successor, Mr. Newton, may well be proud. On visiting it yesterday we were quite surprised to find the flowers in full beauty, and still more surprised at the immense size of the majority, whilst so perfect were many that one would have suspected they had been manipulated, but such has not been the case. Golden John Salter, Golden Nugget, Nil Desperandum, Garibaldi, and Empress of India are only a few of the many notable for their great size. We also noticed a promising new pale yellow called George Glenn. In the Middle Temple Mr. Dale has also a show, and a profusion of flowers on the Pompons in the beds. The Pine Apple Nursery Company have likewise, in their fine conservatory in the Edgware Road, a large collection of the best varieties grown in a different style from the plants just noticed, the aim being decorative effect rather than size of the individual blooms, consequently the same severe thinning which is necessary to secure the latter object has not been practised, yet the result is excellent—just such as a gentleman with a good gardener, with good means, and good varieties might expect from these in his conservatory. Round the fountain facing the entrance there is a grand group of specimens covered with multitudes of flowers, and good ones too, whilst in other parts of this glass-covered quarter of an acre plants are here and there disposed singly and in masses.

—THE Duke of Leinster has been unanimously elected President of the Royal Horticultural Society of Ireland, in room of the lamented Duke, who was president for nearly forty years. No worthier or more distinguished selection could have been made.—(*Irish Farmers' Gazette*.)

—HAZEL in low districts is usually dark-coloured in the bark, and not so highly esteemed as the light-coloured variety, which grows chiefly in Wales and the Highlands of Scotland. White Thorn, if peeled soon after cutting, has yellow lines marking the circulation of the sap, but these can be scraped off. Black Thorn with the bark off makes the finest "white" Thorn, but they are most valued with the bark on, the knots closely set, and triple spikes, if possible, at every knot. Briar is the most easily got of all the varieties, and it is remarkably strong. Should it not taper enough it may be reduced so as to give it the shape. Those that grow on a breezy hillside often rub against their neighbours, thereby producing eccentricities which improve the sticks by "individualising" them. Rowan, or Mountain Ash, makes a good tramping stick, though it has not much appearance, and, with common Ash, it has the property of not firing delicate hands. Common Ash shooting from an old stem, when thoroughly smoothed and varnished, shows fine silky threads streaking its white surface. Broom and Berberry have the prettiest barks both as regards streaking and colour, and both can be stripped should it be injured. Oak, unless a shoot from an old trunk, is not worth the trouble of making into walking-sticks. Gorse or Whin gives by far the prettiest markings of any barked stick, and is remarkably strong.—(*Cassell's Household Guide*.)

NOTES ON VILLA AND SUBURBAN GARDENING.

The dull month of November is now upon us, and after this something like winter weather must be anticipated. I would therefore advise those who have an idea of entering into *winter and spring gardening* to set about the work at once; and I wish it to be understood that, in order to do this at its proper time, it sometimes happens that some beds tolerably passable in

appearance will have to be sacrificed for the sake of getting the winter occupants well stationed before bad weather comes on. I think it is not too much to say that a villa residence or small suburban garden is of all others the most suitable for an attempt at a winter and spring display, because the greatest part of the garden is always coming under the eye, and therefore every part so exposed should have a little decoration beyond what is afforded by ornamental shrubs, trees, &c.

Now let us see what can be done in this way, and I may say that I do not intend to recommend anything expensive, or to enumerate a list of uncommon plants. In the first place all beds, borders, &c., previously occupied by summer bedding plants must be cleared, the ground dug-up to a good depth, say fully 1 foot, and the soil broken up with the spade; no manure need be added. Taking the borders first, and supposing they are defined by a walk, or skirt the extremity of the lawn, and that the usual width of 4 or 5 feet is already ornamented with dwarf green or variegated kinds of shrubs, the spaces between may be filled with patches of the common single Wallflowers in their mixed colours, *Collinsia bicolor*, *Erysimum Peroffkianum*, Californian Poppies, as well as Irises of various sorts, *Helleborus fatidus* all for the back of the border; while more towards the front should come the *Myosotis* or Forget-me-not, *Arabis albidia*, *Iberis sempervirens*, and *Cheiranthus Marshallii*, with alternate patches of scarlet and white Tulips, as well as the various colours of Crocuses and Snowdrops in the front row, or the two may take their places together in that position. The Lily of the Valley must not be left out. The above are all common enough, and if arranged judiciously among the shrubs with some of the annuals mentioned a few weeks ago, the border cannot fail to be as gay as one can wish all through the spring months.

We next come to the beds on the lawn; and if there are several of them, and especially if arranged in a design or group, I would suggest that a good portion of dwarf-growing evergreens should be used to help to clothe many of the beds that would otherwise appear naked. There are plenty of suitable subjects, as *Thuja aurea*, *Juniperus ericoides*, *Yucca filamentosa*, *Mahonia Aquifolium*, *Euonymus*, both silver-variegated and green, small blooming plants of the *Laurustinus*, dwarf plants of the common and Portugal Laurels, and there are the green and variegated Box trees, as well as the gold, silver, variegated, and green Hollies, all of which in their dwarf state make up a capital selection for a small garden, and if so arranged in the beds as to allow of other things being used with them, either as edgings or as a ground covering, or perhaps planted so as to ensure the bloom of the flowers associating in height with the foliage of the evergreens on the mixed principle, there will be much that will please. Some of the beds may be edged with a broad band of mixed Polyanthus or blue Pansies; for instance, the latter with a bed of golden-leaved Holly will look well, or the green *Euonymus*, having a band of the *Arabis albidia*, a white flower, is an attractive bed. If the beds are in a design the evergreens ought to be so arranged that a bed may be occupied with them here and there over the whole place, having beds at proper places to be planted with other plants, such as *Silene pendula*, *Saponaria calabrica*, *Myosotis*, Wallflowers, Polyanthus, Pansies, Daisies of two or three colours, and even the common hedge Primroses and Violets ought to have a place; these may either be arranged in designs according to their height and colours, or, if the beds are small, each one may take a separate sort of plant of dwarf growth, and be edged with Crocuses or Snowdrops, or both.

I think such a garden would not be complete without its complement of Hyacinths, Tulips, Narcissus, Anemones, and other bulbs; and as there would be beds of evergreens, I should arrange so as to have complete beds of each of the above sorts of bulbs, for they would need a little preparation for their successful growth, but they would also be so distinct from the other beds as to render the whole very complete, and so varied in colour and design that they could not fail to be attractive. All the bulbs of whatever kind ought to be planted by the middle or not later than the third week of November to ensure their doing well, but oftentimes people plant later, yet they at times succeed well; however, this is not so certain as if they are planted at the proper time.

Now let me say a word or two upon the treatment of these bulbs. Hyacinths, and in fact all the large bulbs, root deeply and vigorously in the soil; the beds should therefore be deeply dug and drained if the surrounding soil is of a retentive nature, for although the Hyacinth likes moisture when growing fast, yet it must not become stagnant about its roots. Add manure to the soil in a very rotten state, or leaf mould well decomposed, raise the soil 4 or 5 inches above the surrounding level, plant immediately if the soil is dry, or if very wet leave it a day or two to become workable; they should be planted regularly over the bed, especially if arranged according to colours; use a small trowel for planting, and put them in not more than 4 inches deep, taking care that they are all of uniform depth, otherwise they will come up and flower irregularly; leave the bed in a level state. I ought to state that my plan is to put a handful of

sand around each bulb, for if much wet succeeds the planting I think the sand prevents decay. Although the Hyacinth is hardy, I think a little protection is all the better in severe weather. I have at times covered my beds with light half-rotten leaves, sticking some Spruce Fir or Laurel boughs among them. Those bulbs that are planted in the mixed border ought to have the same preparation as to soil, by digging a hole of fair size, and working-up some of it with other of an enriching nature, and protected as advised above. Beds of Tulips, Narcissus, and the others will succeed admirably under the same treatment as for the Hyacinth, and both these and Tulips plant about 8 inches apart all over the bed, and the same from row to row, but those in patches may go a little closer together.

All the plants I have enumerated will bear moving when done flowering in the spring. Do it carefully, and in the case of the evergreens water well before taking up, and also after being planted again. A piece of ground should be kept in reserve for these, shady if possible, and they may be put in moderately thickly, but they must be taken care of during the summer, and the ground kept clean from weeds, in fact everything must be done to assist them to recover their removal at that unseasonable time of the year for such work.—THOMAS RECORD.

MILDNESS OF THE SEASON.—Some dishes of large and ripe Strawberries, the produce of Vicomtesse Héricart de Thury, have been gathered in the garden here within the last few days.—E. RAWSON POWER, Tenby, South Wales.

DOINGS OF THE LAST AND PRESENT WEEKS.

KITCHEN GARDEN.

THE question is sometimes asked, What is the best edging for kitchen garden walks? There is not the least doubt that Box is the best as far as appearance goes; it is also a very cleanly edging. The only fault to be found with it is that it is a harbour for slugs. They sally-out from this snug harbour and devour choice vegetables in the earliest stages of their growth, this more especially when the edging has been neglected for a few years; by trimming it annually the edging is kept within bounds, and very little chance is left for garden depredators. We have seen edgings a foot high and nearly as much through, and then they were an eyesore instead of being ornamental. Box edgings should be cut every year if possible, if not every alternate year. Our plan is to relay a portion each season, and in this way the edgings are kept within bounds, and any gaps are filled up. Edgings are sometimes formed of Strawberry plants, Parsley, or some of the neater-growing herbs, such as Thyme, Marjoram, &c.; but they soon become unsightly, and are troublesome to keep in good order. Stone, artificial or otherwise, bricks, and tiles are also used. A very neat edging is made of stone-coloured pottery and glazed, but to make a permanent job of it a brickwork foundation must be put down. Our choice of an edging is between Box and these stone-coloured glazed tiles. The first named is the neatest, and costs about half as much as the tile-edging at first, but this first cost is more than counterbalanced by the greater attention required to keep the Box in good order afterwards. Now, the tile-edging will last for twenty years or more, and does not require anything all that time. Strawberry plants or Cabbages may smother it for weeks or months; it will be none the worse for it. Many Box-edgings are injured yearly through this cause alone. It is all very well to say, "Do not allow plants to grow over the edgings." No one would if time could be spared to look after them; but when all sorts of trees, vegetables, and weeds are in full growth, it is no easy matter to decide what to do first.

We have laid down a permanent edging of tiles in this way. First get a moderately solid foundation—of course, the more solid it is the better—and having made the bottom level, about 10 inches below the surface of the walk, lay on it a course of bricks end to end, then put on a layer of mortar and another course of bricks, on this bed a brick on edge, and the base of the tiles on the same foundation. On one side of the tile is the brick on edge, and on the other is the gravel, so that when the work is completed the bricks are covered by the soil of the border on one side, and on the other the gravel is filled-up to the same height, leaving only the ornamental edge of the tiles above the surface. The tiles are frost-proof, and the brickwork does not suffer, as it is effectually protected.

The weather has been very favourable for preparing ground for planting. A week ago the ground was dug for Cauliflowers, and to give the plants a good start some nice dry loam was placed on the surface of the ground before the hand-glasses were put down. Most of our time has been taken-up with digging and trenching.

GREENHOUSE AND CONSERVATORY.

Now that flower gardens are flowerless, and even the mixed borders, which are never without flowers of some sort from

November to October, are now singularly destitute, the above structures should be gay with flowering plants. Foremost are the different sections of the *Chrysanthemum*; whether the house is large or small they are equally acceptable. For very small houses the Pompon or Chusan Daisy section of *Chrysanthemums* are better adapted than any other. Where there is plenty of room it is desirable to grow all of them—that is, let all the sections be represented. From time to time during the summer and autumn months instructions as to management have been given in the "Doings." Now the plants will well repay the labour that has been judiciously bestowed upon them. The quaint forms of the Japanese varieties contrast well with the more correct and symmetrically-arranged florets of the "florist" type, or large-flowered varieties. We have been much bothered with two enemies, the one being as bad as the other, not to mention mildew, which repeatedly attacked the plants before they were taken into the houses, and followed them even there. More troublesome still are the earwigs, which hide amongst the florets by day and feed upon them at night. They can be trapped in two ways. As the most convenient, we have placed small pots inverted on the tops of the sticks, and in the bottom of the pots a little moss; into these the insects retire at night, and in the morning they can be destroyed. A few lengths of bean-stalks inserted amongst them are also a good harbour; applying the mouth to one end of the tube, a puff of wind clears the whole of them out into a pot of hot water. Damp is even worse to master than this insect pest. Those blooms that are intended for exhibition must be preserved intact if the stand containing them is to be at the top of the prize list; therefore, as soon as a single floret decays from damp it is removed at once, as a few hours will cause the florets in contact with it to decay. These, again, will spread the mould in all directions, and the flower will be quite spoiled. We found it necessary to have a fire on nearly every day during the last week, with air by day and a little air at night, except during foggy nights; indeed, this is one reason of decay in the neighbourhood of London. The close atmosphere accompanied by dense fogs baffle the utmost ingenuity to keep the proper atmospheric conditions for them.

The earliest *Cinerarias* are showing signs of opening their flowers; these plants are well supplied with water. A little liquid manure twice a-week is beneficial to them, causing the foliage to be of a deeper green, and the flowers of a richer tint. It is a sign of bad management somewhere when the foliage of any plant is not of its natural green. Some varieties of plants have pale green foliage, others have rich deep green, and scores of intermediate shades are to be found, each of the different shades harmonising with the colours of the flowers. So much is this the case, that in many instances (some persons say in all), that the colour of the flower can be determined by the colour of the leaf. The aim of the cultivator, therefore, is to so manage the plants under his care that the natural shade of colour in the leaf may be produced. An over-luxuriance in any plant is not more desirable than a deficiency.

Herbaceous Calceolarias are now at a critical stage. Seedlings are easiest to manage; indeed the named varieties are so seldom cultivated, that those who have them do not require any instructions. Seedlings sometimes damp off from careless watering; the large succulent leaves hug the surface of the mould, and in a damp atmosphere decay speedily begins and rapidly spreads; we have also fumigated the house several times to prevent green fly from attacking them. Pelargoniums and many other plants, if badly infested with fly, will, when the pest is removed, quickly recover. Not so a *Calceolaria*; if aphid is allowed to remain on the plants they seldom flower satisfactorily, and sometimes are totally destroyed. All decaying leaves and flowers are removed, the plants neatly arranged, and carefully attended to with water, which is wiped-up at once, so that brightness and freshness prevails indoors when decay is all around and above us outside.

FLOWER GARDEN.

Here again we are a little behind; the summer occupants of the flower beds are not yet removed, but had other work not been pressing this would have been done, and those beds that are planted with spring-flowering plants would have been filled. Potting *Carnations* and *Picotees*. With us these are more properly greenhouse than flower-garden plants. Were they planted out in beds here they would grow, and some of them would perhaps flower, but very little satisfaction would they give to an ardent florist. Failing open-ground culture, potting was tried, and the result has been very satisfactory. At present a pair of plants are potted into a 60-sized or small 48-pot. Some persons pot their plants up much earlier than this, but the growth becomes stunted when they remain too long in such small pots, and for the same reason the plants should not be put into their flowering pots too early in the spring months. One great disadvantage that we labour under here is the light sandy nature of our soil; it does not seem to have sufficient holding power. All such plants grow freely enough in it, but when the time comes for the flowers to expand, the difference in favour of

plants grown in medium clayey loam over those grown in light sandy soil is something astonishing. When the plants are potted they are removed into a cold frame and plunged in some cocoa-nut fibre refuse; the lights are kept close for a few days. Auriculas have now been removed to the sunniest and driest position in the garden, and to prevent the plants from being injured by damp, all decaying foliage is picked off as soon as it is perceived.—J. DOUGLAS.

PROVINCIAL HORTICULTURAL EXHIBITIONS.

[SECRETARIES will oblige us by informing us of the dates on which exhibitions are to be held. Although we cannot report them fully, we shall readily note anything especially excellent, and we wish for information on such specialities to be sent to us.]

TO CORRESPONDENTS.

*. All correspondence should be directed either to "The Editors," or to "The Publisher." Letters addressed to Mr. Johnson or Dr. Hogg often remain unopened unavoidably. We request that no one will write privately to any of our correspondents, as doing so subjects them to unjustifiable trouble and expense.

Correspondents should not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, and should never send more than two or three questions at once. All articles intended for insertion should be written on one side of the paper only. We cannot reply to questions through the post.

LIVERPOOL CHRYSANTHEMUM SHOW (W.).—Yes. Send us your private address for not for publication.

POTATOES.—"D. W. W." finds that Sutton's Hundredfold Flake is waxy, and not a good table variety. He wishes to know if other growers of it have found the same defect.

BELGIAN FRUITS (R. W.).—The varieties you mention could be supplied from Ghent by M. Van Geert, St. Annand; N. Gansard, Ledeburg; or Louis Van Houtte.

ALTERNANTHERA PROPAGATION (W. Marfleet).—There are several kinds of Alternanthera, all of which are increased freely from cuttings with two or three joints, inserted in sandy loam with a little leaf soil, and placed in bottom heat if propagation is practised from September to March inclusive, maintaining a rather moist and close atmosphere. The bottom heat should be about 75°. Cuttings with two joints and the growing point are long enough; cut below the joint, remove the leaves from it, insert up to the next joint, surfacing the cutting pots or pans with about half an inch of silver sand. They strike freely in July or August in a cold frame kept close and shaded.

WINTERING CALCCEOLARIAS AND COLEUS (Co. Aurim).—We do not know "Sedum secunda glauca." Is it not Echeveria? which requires to be grown in a house safe from frost in sandy soil, and to have no more water than will keep it fresh. If Sedum glaucum, it is hardy in well-drained soil. The Calceolarias may winter in a border if the weather should be mild, but the best plan is to put in cuttings in a cold frame. Coleuses may be wintered in a Fern case in a warm kitchen window, watering carefully; but if the plants are taken from the open ground it is likely they will die off when placed in the case. The American Pea Nut we do not know. Our correspondent wishes to know "what sort of a plant it is, if it can be successfully cultivated in this country, and if so, how?"

SELAGINELLA LEPIDOPHYLLA CULTURE (Francis Hopkinson).—The above is the name of the plant you sent us, and which you were erroneously told was a Fern. It is the true kind, and rather rare, the plant generally cultivated under that name being erroneously so called. It succeeds in a stove or warm fernery, and requires to be kept very moist, for if dry its fronds are drawn in to the centre, forming a sort of ball, and open when moisture is given. Equal parts of rough peat and yellow loam, with a sixth each of silver sand and broken pots, will grow it well, affording extra efficient drainage. A sprinkling of water overhead should be given two or three times a day. Though moisture is wanted, avoid making the soil a sodden sour mass. Propagation is effected by division in spring if the plant has more crowns than one, and sometimes a frond pegged-down will put out fronds and form a crown. It is also increased by spores, of which your plant is not devoid, covering with a bell-glass the pot or pan, and setting it in a saucer of water.

LARGE DRACENAS AND ERYTHRINA (Almer).—Your Dracenas 10 feet high and handsome well-furnished plants, would be very suitable for large lofty conservatories, and would command a good price from those furnishing such, but we could not say how much, as price greatly depends on the kind and the plants. The Erythrina would not be worth so much, as it is a commoner subject and not in great request. You will occasionally see such things advertised for. Your best plan will be to offer them to some of the leading London or provincial firms, or an advertisement would probably bring you offers. You might dispose of them in exchange for plants you might wish.

PLANETARY INFLUENCE (A Lady Subscriber).—Some centuries ago all persons and all plants were believed to be especially influenced by some one of the planets. Thus some in the list you enclose were "under Mercury," others under Jupiter, Mars, &c. Such superstitions are now extinct, or ought to be.

ARRANGING A CONSERVATORY (A Subscriber).—The Ferns would be best cultivated on rockwork, which we should construct against the wall between the two casements—the 3-feet-8-inch and 10-feet one, and form an archway

over the casement doors, continuing the rockwork against the 3-feet-9-inch wall, taking care to have it irregular in outline. We would not make it project further than 5 or 6 feet at the base in the widest part. In the centre you may have a fountain, which will take up the best part for plants; therefore if we had a fountain at all it would be immediately in front of the casement doors, with low irregular rockwork, with say four plants of Lomaria gibba in the rockwork; but instead of the fountain we should have a bed with a Dicksonia antarctica in the centre and other Ferns at the base. In the centre have a bed with Camellias, and all round the glass part a stage about 3 feet wide for plants, omitting, of course, the door. The stage should be 2 feet 6 inches from the floor, and under it might be a border for climbers, which are very desirable as shade.

ZONAL GERANIUMS.—In answer to "J. Hardie," page 387, the opinion referred to is based upon practice. I did not express myself as clearly as I ought. The sentence should run thus:—Never water a plant when dust-dry or suffering for want of water, but first water with clear water, &c.—W.

CAMELLIA LEAVES BLACKENED (E. A. S.).—The leaf is blackened by water dripping upon the plants, or from syringing and water hanging from the points of the leaves, with exposure to the powerful rays of the sun in summer whilst in the condition named. Shade in summer from bright sun. The leaves curl from want of a good root-action, they being probably destroyed by standing in pans filled, we presume, with water. Repot in spring. We cannot name plants from a leaf; flowers are necessary.

MANETTI STOCKS STRONG (A Constant Subscriber).—The stocks are not too old for budding, but you may in spring graft them, and any failing you may bud in July. Manure obtained in small quantities at a time is best kept to a shed free from the weather, and spread-out thinly, alike for the purpose of drying before it is placed in a heap and to prevent heating. We presume it is short manure. Mix it with an equal quantity of dry soil, put in layers in a square heap about 2 inches thick. It will lose little if stored in this way and kept covered with soil.

IMPORTING PLANTS FROM CEYLON (C. S.).—We do not know what the King of the Woods is, nor what plants it may be desirable to introduce to this country from Ceylon; but the most valuable ones will be Orchids, though bulbs or plants of more than ordinary beauty would be worth looking after. Such matters are best left to those sending or collecting them. The bulbs and Orchids would come best packed in dry or very slightly damped moss in boxes, and any plants in a Wardian case, establishing them before starting. Young plants will be best. Single dark free-flowering Fuchsias are—Mr. George Brunning, War Eagle, Try Me oh! and Killiecrankie.

REPOTTING PALMS (F. E. H.).—In repotting Palms they should have the roots covered with soil just level with the base of the stem, and slightly raised in the centre of the pots or tubs. It is better to have them high rather than low.

MALFORMATION OF CHRYSANTHEMUM BLOOMS (Pompon).—It may be caused by an excess of manure either in a solid or liquid state, which causes grossness and malformation, neglect in watering, attacks of insects, and injury from frost. The effect of sulphate of ammonia is to increase the growth or vigour of the plants, and the indications of its too abundant use will be lank gross growths, soft instead of firm, and loss of roots, which will cause loss of leaves and sometimes of plants.

VIOLETS (G. W. Boothby).—Your new variety, Beauty of Louth, is very good. Size large, form somewhat differing from others, colour a medium dark purple, and fragrance strong.

STRAWBERRY CULTURE (C. H.).—We answer your questions in the order they are put by you. It is necessary to manure the ground well for Strawberries, and dig deeply, placing it at least 9 inches below the surface, and afterwards manure at the surface. In sandy soils a dressing of clay, and especially clayey marl, is a capital addition, mixing thoroughly with the soil. The plants of the smallest kinds, as Black Prince, Keens' Seedling, and others with only moderate foliage, should be planted in rows 2 feet apart; but the strong-growing and spreading kinds, as President, should be 2 feet 6 inches apart. The plants in the first instance may be put out a foot apart for the smaller-foliated sorts, and the large-foliated sorts at 15 inches, and after the first year's fruiting every alternate plant may be taken out, so that they may stand 2 feet and 2 feet 6 inches apart respectively. The runners should be removed, what are wanted for increase being layered either in pots or the ground, and planted as soon as well rooted, the plants being kept free of all other runners. The tops ought not to be cut off at any time, but in September any straggling leaves as well as runners may be removed. You omit a very essential part—manure well between the rows and plants in October. Strawberries should be well watered after they come into flower, and until the fruit is ripe and ripening. Spring water is not so good as soft, but will do, as Strawberries like the roots cool. Rankness of growth is to be overcome by cutting most of the leaves in July, which will lessen their growth, and fresh leaves closer in growth will be produced, and these will have a tendency to mature the crowns. When the plants have many blossoms and weak, thin them, layering runners from them, and water abundantly; after the fruit is gathered knock them up, forming another plantation with the runners from them. Always take runners from fruitful plants. Our soil is light and moory. We manure heavily, follow the above system, keep the plants three years, and renew a part of the plantations every year, besides planting out forced ones, so that we have one-year-old, two, and three-year-old plants. Keens' Seedling and all the earlier do best the first year, planting in July well-rooted runners of the current year, but produce a heavy crop the second and third years, but smaller fruit, and the plants begin to die off; the later sorts are best the second year, though they may have fine fruit the first year; we have had them over 3 ozs. weight, many 2 ozs., and commonly a dozen to a pound. In the third year the plants bear heavily, but the berries are not nearly so fine, the plants go so much to leaves as to be of very little use afterwards. We have omitted to state that they are not allowed to run over the bed into one another, but are kept separate.

STRAWBERRY LEAVES SPOTTED (D. W. W.).—The leaf sent is spotted in consequence of dry weather. It is common to all the kinds of the Keens' Seedling type. It will not interfere with the future well-being of the plants. Currant and Gooseberry trees are native plants, perfectly hardy. They should be manured now, but it is not necessary to cover the roots with any protecting material.

GRAPES DISEASED (J. P.).—It is only the form that "the spot" frequently assumes when attacking Grapes nearly ripe. The roots are probably too dry or too cold.

ERRATUM.—At page 356, thirteenth line from top, on "Fine Old Trees at Moor Park," the word "having" should have been "leaving."

VINE LEAVES MATURING (A. A.).—The leaves are quite healthy, and we think the earlier maturity of the one Vine as compared with the other is solely due to the want of moisture, the Vine with the green leaves having a considerably moister border. If the Grapes are not ripe now upon the Vine with the mature leaves they never will be so. Perhaps they are ripe but not well coloured.

FRUIT TREES FOR GARDEN (J. Maddock).—*Apples*, Dessert—Early Red Margaret, Red Astrachan, Kerry Pippin, King of the Pippins, Cox's Orange Pippin, Court of Wick, Ribston Pippin, Mannington's Pearmain, Reineette du Canada, Adams' Pearmain, Lord Burgly, Cockle Pippin, Melon Apple, and Sturmer Pippin. *Kitchen Apples*—Lord Suffield, Alexander, Cox's Pomona, Rymer, Mère de Monage, Blenheim Orange, Dumblew's Seedling, Warner's King, Bedfordshire Foundling, Afriston, Winter Majestic, Tower of Glamis, and Norfolk Beefing. *Pears*—Citron des Carmes, Jargonelle, Bourne Giffard, Williams's Bon Chrétien, Beurré d'Amanlis, Beurré Superfin, Louise Bonne of Jersey, Beurré Hardy, Jersey Gratioli, Baronne de Mello, Doyenné du Comice, Marie Louise, Beurré Diel, Van Mons Léon le Clerc, Napoleon, Beurré Bachelier, Glou Morceau, Winter Nolis, Beurré de Rance, Ne Plus Meuris, and Bergamotte Esperen. *Catillac* is best for stewing. *Dessert Plums*—Kirke's, Green Gage, Golden Gage (Lawson's), Transparent Gage, Denniston's Superb, and Cox's Golden Drop. *Kitchen Plums*—Diamond, Mitchellson's, Prince Englebert, Prince of Wales, Pond's Seedling, and Victoria, also Damson. *Cherries*—May Duke, Bigarreau Napoleon for dessert, and Kentish and Morello for culinary use. *Apricots*—Kaisha, Hemscher, Royal, and Moorpark. *Peaches*—Early Louise, Early Alfred, Grosse Mignonne, Dymond, Violette Hâtive, Lord Palmerston. *Nectarines*—Lord Napier, Elruge, and Violette Hâtive. *Nuts and Filberts*—Kentish Cob, Dwarf Prolific (Pearson's), Purple, Red, and White Filbert. *Medlar*—Nottingham. *Quince*—Portugal.

SOLANUM CAPSICASTRUM (H. J. James).—This is the species of which you sent us a specimen. It was dried-up, but we think the leaves are changing colour because its period of growth is over. It may be raised from seed sown in February.

APPLYING SALT TO ROSES (L. J. K.).—The mildewed leaves may be syringed with a solution of salt, 4 ozs. to each gallon of water. It will not injure the trees by sinking into the soil over the roots. Prevention of the mildew is better than to have to cure it. Mildew will rarely appear if the roots are thoroughly watered in spring and summer, and a mulching of rich manure kept on the surface of the soil.

NAME OF FERN (H. L. E.).—It is readily distinguishable by its wiry creeping stolons as *Nephrolepis tuberosa*, a very handsome yet common kind. We have it on rockwork covering several square yards, the fronds from a height of 8 feet reaching a long way down towards the floor.

MOVING ROSES FROM A NURSERY (H. L. E.).—Get them any time after the middle of this month and plant, mulching well with littery manure after planting, and watering if the ground be dry.

FUEL FOR HEATING GREENHOUSE (Seyber).—Of the kinds of fuel you name we should prefer the coke, but all boilers do not consume it well, though most will if it be mixed with small coal or slack. We use "nuts," which are not so wasteful as small coal. Coke, if it has to be brought from a distance, is too costly, and if you find the cost will be more than that of house-coal nuts, we advise the latter. The other descriptions of coal are not suitable for ordinary furnaces.

NAMES OF PEARS (Idem).—Hogg's "Fruit Manual" contains what you wish. A new edition is in the press.

TOMATOES FAILING (R. P.).—From the description you give of the failure of Tomatoes it is clear you have the Tomato blight or disease, which is the same as the Potato disease. Probably your soil is too moist and rich. Keep it drier, and do not enrich it. We presume you do not save seed. If you do, throw it away and have a change.

BOTTOM HEAT FOR CUCUMBERS (Idem).—The two 4-inch pipes ought to give you sufficient bottom heat. It is quite a matter of taste whether the pipes are in a chamber or covered with rubble to the depth of about 6 inches, but by the latter you will have a higher bottom heat than were the pipes in a chamber, and more steadily. The four 4-inch pipes along one side and end, or two 4-inch pipes along two sides and one end, ought to give ample top heat.

HEATING GLAZED VERANDAH (Harriet S.).—If you use the flueless stove you mention you will kill some of your plants and injure the others. No fuel can be used that does not give out hurtful fumes. Cannot you use a small gas stove with a tube to convey the fumes into the outside air?

CHARCOAL-HEATED STOVE (A. A. M.).—Whether the stove would heat efficiently depends on the size of the house and the heat which is to be maintained. Coke would be cheaper; but whatever fuel be used, carry off the gaseous products of combustion by a pipe opening outside the house, and take care to insure sufficient moisture in the internal atmosphere.

PIPING TO HEAT A GREENHOUSE (Holly Bank).—As you only propose to heat on one side you will require three 4-inch pipes the length of the house, two flows and one return, or better four pipes, as the ends are in a very bleak and exposed situation. This will give you two flow and two return pipes, each the length of the house.

LIQUID MANURE FOR CHRYSANTHEMUMS (Idem).—When the Camellias commence anvering their buds they may be watered with weak liquid cow manure once a week, also Azaleas, and for the Chrysanthemums and Primulas it may be applied at every alternate watering. The Azaleas ought not to be repotted until they have flowered, and then immediately. A stage of Camellias, Chrysanthemums, Azaleas, and Acacias ought not at this season to be syringed twice a day, nor at all unless it be occasionally to free them of dust.

CURING AMERICAN BLIGHT (Idem).—The following is from the "Gardeners' Year-Book" for 1874, and is an infallible remedy:—"Take a pint of gas tar and mix with it a pint of dry powdered clay. Form the whole into a paste by adding by degrees a gallon of warm soft water." Apply with a brush to the parts infested, and, in fact, the whole tree but the buds, and bare the roots and examine them, as this pest descends and feeds upon them in winter. The composition should be thoroughly brushed into the crevices and angles. Apply warm—not over 120°.

OIL FOR AMERICAN BLIGHT (Miss D.).—Lined oil boiled and applied cold with a brush. It is sold ready boiled by all oil and colourmen.

WALL BORDER (A Fresh Subscriber).—If the border is wider in one part than it is in another, that would not make any difference to the health of the trees. The wide part would not have any advantage over the narrow part, nor the narrow over the wider portion.

NAMES OF FRUITS (J. R. W.).—Beurré d'Amanlis. (H. Hall).—2, Swan's

Egg; 4, White Doyenné; 5, Jersey Gratioli. The numbers of the others were quite obliterated by the acidity of the rotten specimens. (A. A. C.)—1, Belle de Nôl; 2, Glou Morceau; 3, Beurré Diel; 4, Dunmore; 5, Blenheim Pippin; 6, Winter Greening. (W. G.).—1, Autumn Red Calville; 3, 5, Adams' Pearmain; 7, Braddick's Nonpareil; 8, Bess Pool; 12, Warner's King. (B. L.).—1, Brown Beurré; 2, Bergamotte Cadette; 3, Beurré de Rance; 4, Jersey Gratioli; 5, Napoleon; 6, Swan's Egg. (S. G.).—Your Grape appears to be Black Prince. (E. P. N.).—1, Gogar Pippin; 2, Pigeon; 3, Keswick Codlin; 4, Borovitski.

NAMES OF PLANTS (F. E. H.).—The Tunis plant is *Cassia ligustrina*, Privet-leaved Cassia. Your friend must have confused it with the remembrance of some other plant. All the *Cassias* are yellow-flowered. (D. Ferguson).—*Alonsoa incisifolia*, a native of Chili, and very worthy old inhabitant of our gardens. (B.).—Cannot name from leaves only. (W. B. P.).—Your Ferns are *Adiantum macrophyllum* and *Onychium lucidum*. (W. F. R.).—*Asplenium bulbiferum*. (H. P.).—1, *Cyrtanthera Pohliana* (*Justicia carnea*); 2, *Pyrus japonica* (?); 3, *Hypericum hircinum*; 5, Perhaps *Erianthus Ravenne*. We do not name florists' flowers. (T. Neib).—*Oberonia* sp. (J. S. R.).—*Browallia viscosa* and a *Commelina*. (W. F. R.).—It is a *Bouvardia*, but no one can name a plant from such a dried scrap.

POULTRY, BEE, AND PIGEON CHRONICLE.

THE POULTRY-KEEPER.—No. 26.

THE MALAY.

COCK—GENERAL CHARACTERISTICS.

The body smaller than that of the Cochins; form more erect than of any other variety; flesh ordinary, hard, and dense; feathers long and straight, lying close on the body; thighs, shanks, and feet strong and long; shoulders projecting; tail slender and short; comb triple and very thick; skin red; beak and feet yellow.

Weight.—Eleven pounds.

Height.—Twenty-nine inches and a half from the head to under the feet.

Body.—Conical, large in front, and becoming gradually smaller to behind, where it becomes pointed. This shape and the plumage is so slippery and close-fitting on the bird that it is difficult to hold it. The body is much inclined from before to the tail, and the arched back forms an angle of 45°. The thighs and shanks are long, strong, and thick. There is no variety that has so much flesh on the breast and pions. The wings are placed very high and very close to the sides, which make the shoulders very large.

Head.—Strong, short, and conical, flattened on the skull, and wide between the eyes. The red fleshy part which envelopes the whole head is very apparent.

Comb.—Thick in a single lump, yet one of the triple combs covering the base of the beak and extending to the middle of the skull.

Wattles.—Middle-sized.

Ears.—Proportioned to the length to the wattles.

Cheeks.—Large, and bare, and red.

Beak.—Short and conical, very strong, bent down, and clear yellow.

Eye.—Malicious, having the expression of that of an eagle; iris rosy yellow; pupil very dark; eye covered by an eyelid so much developed that when seen in front the eye is not visible. The bird's look is always savage and menacing.

Shank of Leg.—Very long and very strong, of a bright yellow colour.

Toes.—Strong, long, and well clawed, of the same colour as the leg.

The Malay cock is one of those hardly to be classed among the fighters. His gait is restless and threatening. His physiognomy is cruel, impatient, fierce. He carries the head very high; his neck, straight and slender, gives an angular form to the shoulders. His body is very much raised in front and set on long legs, and finished by a slender horizontal tail, composed of short feathers straight and pointed. Somewhat fleshy and large in the body, its plumage is smooth and close.

Plumage.—The feathers are very long, very straight, and without any down, fitting close to the body in layers like the scales of a fish. They seem varnished and are very slippery.

There are Malays of many colours, but the principal types are—The White variety, the most esteemed for the good effect they produce when the cocks and hens are together, the pure white of the feathers, the yellow beak and feet, and the red which surrounds the head are effective.

Of the Black variety, the cock is always marked with red on the shoulders, though the rest of the plumage is black, and the hen is all black.

The Red variety is bright red on the hackle; the lancets and the large wing feathers of a deep mahogany red to the shoulders, on the breast and thighs of a paler red on the sides, on the abdomen, and legs; coverts of the wings and the whole of the tail brilliant green. The hen of this variety is entirely red with rosy tints in patches in all the varieties. The hackle feathers are short, and make more apparent a very long neck. The tail is short and thin.

The Malay hen has the same characteristics as the cock, and has also fighting propensities. She has like him a conical shape, fierce look, and a dark and cruel eye. The hackle feathers are extremely short and close-fitting on the neck, giving to this part a very slender appearance, making still more than in the cock a greater prominence of the shoulders. She weighs from 6 lbs. 10 ozs. to 7½ lbs. Lays a pretty large number of eggs, having a yolk light yellow, very solid. She sits well and brings-up her chickens well.

The English esteem this variety highly, using it for a cross to give weight to birds for table. I think it should be used with great circumspection, especially with Cochins or Brahmans. Malays often are sold in France under the name of "the Brazil," "the cock of Gros-Marne," sent to the Society of Acclimatisation under the name of "the Reunion cock," and an amateur member of this Society wished, under pretext of a difference hardly discernible, to call "the Malacca."

In conclusion the variety is useless, and its fierce habit makes it impossible to associate it with our indigenous fowls. The detestable fowls known under the fallacious names of "Ganges," "Bengal," "Russian," and "American," are degenerated or mixed descendants of the real Malay.

OXFORD POULTRY SHOW.

THE third annual Exhibition was held in the Town Hall and Corn Exchange on October 25th and 26th, and we have great pleasure in congratulating the Committee on the substantial progress they have made in their entries. Mere numbers are not always to be accepted as a sign of success, but here a marked improvement has taken place in the general character of the birds; and although we have no doubt that the most experienced exhibitors have reserved their best birds for the great Show that is soon to follow, still great interest was taken, and the classes anxiously examined for fear a chance pen might snatch the blue ribbon from some of the expectant winners. The entries numbered 1412, and the arrangements were satisfactory, with the exception of the sale office. This was announced to open at 2 P.M., but did not open until fifteen minutes past. It appears that several people wanted the same bird, and the Committee were in doubt if they should let the first comer have it, or put it up by auction to the highest bidder; they adopted the first course, which we think was the right one, as it would have been hard upon the intending purchaser, who had patiently waited at the door for three hours to be first on the list, to find himself only in the same position as the last comer. The most satisfactory course, no doubt, is to sell the birds to the highest bidder, but then it should be so stated in the rules.

Dorkings had four classes. The Coloured chickens disappointed us. The first-prize cock was a large one, but very much up in the back, and it was a mistake placing him in the prize list. The second-prize pen was fine, and certainly the best in the class; the third also good, but we liked another pen shown by the same winner (Burnell) better. The cockerel will make a fine bird when more developed. Pen 11, belonging to Mr. Lingwood, was superior to some of the noticed birds. Possibly the Judge considered them too old for the chicken class; if so, they should have been marked "disqualified," this would have explained the cause of their omission. The Silver-Greys pleased us. The first-prize cockerel was a splendid bird, well grown, with no sign of the crooked breast which is so prevalent with this variety. The pullet was beautiful in colour. We think this pen should have had the cup. The Blues were moderately good; we should very much like to see some good breeders take them in hand, it would pay them well, as we know of no other variety that might be so quickly improved and brought to the front. The White Dorkings were generally creamy; we thought them a poor class.

Spanish do not generally muster so strongly so early in the year—there were sixteen entries. The first-prize pullet was a nice bird, with rather a good lobe; the cockerel had a peculiar cut in the comb, which might have arisen from being wired up, or some accidental cause; we also thought him wry-tailed. We think this must have escaped notice, otherwise he would not have been in the prize list. The running was very close between the second and third pens, and we think we should have placed the third (Beldon) in the front. Pen 61, highly commended (Rodhard), contained a pretty cockerel; pen 63 (Brown) a nice cockerel, but out of condition, and matched with an inferior pullet.

Cochins had four classes, all good. In the Buff the competition was very close between Mr. Percival and Lady Gwyder. The Judges gave the preference to the first-mentioned; but we think we should have preferred the latter. The first-prize birds were evenly matched in colour, but the cock was narrow in the back, and much lighter than the second. The hen was also slightly striped in the hackle. The second-prize cockerel was a grand bird, but tinged a little in the wing with white. The pullet was sound in colour, but deficient of leg-feathering, or rather toe-feathering, the middle toe was almost bare. The

Partridge did not please us so much as the Buffs; in the cockerels we noticed the leg-feathering was not so good as usual, and the pullets, with the exception of one or two pens, not so well pencilled. The first-prize cock was a fine one; the second should have been left out for the same reason that we have suggested with regard to the first-prize Dorking and Spanish. The third we liked; the pullet was good, but not equal to one we remember Mr. Tudman to have shown at this season of the year at Croydon about two years back. Pen 95 (Coleridge) contained a nicely pencilled pullet. Blacks have improved, and mustered sixteen entries. Whites were a good class: the first-prize pen contained a charming pair; the second-prize cock had a very white lobe. Pen 130 were small; in other respects we liked them better than the second.

Brahmas.—The Dark class contained thirty-four entries, and the competition was very close. In the first-prize pen we found a beautiful pullet, but rather a coarse cockerel; second a fine cockerel, well shaped, and good in colour. Miss Douglas Pennant showed four pens, which were greatly admired. The cockerel in pen 152 will when more developed be very difficult to beat; the pullet was well pencilled, but rather small. Mr. Leno showed a splendid pullet, well shaped, almost perfect in pencilling, but rather deficient in leg feathers. The Light class exceeded the Dark in numbers. They had forty-nine entries. The best cockerel was in the first pen, but as a pair we preferred Mr. Lingwood's, pen 208, which were awarded the third prizes.

Game.—The winning Black Red cockerel was a splendid chicken, and must have given the Judges no trouble in making their selection. Pen 221, third prize, and also the local prize, deserved his position, but he was badly dubbed. In Black Red pullets we thought pen 268 (Pope) deserved some notice. The other Game classes were well judged, and pleased us as indicating a most satisfactory season.

Hamburghs were beautiful. The Silver cockerel in pen 410 was a magnificent bird, exquisitely marked in the tail; his partner was also a beauty.

Polish.—Blacks only five entries, out of which two (Unsworth) were marked as arriving "too late for competition." In the Any variety class Mr. Adkins again won all the prizes; his two first pens appeared unapproachable.

Of *French* fowls Houdans were a splendid lot. First-prize cockerel very fine, but we doubt if we shall often see him in the prize list, as his comb will be considered a strong objection by some judges. The Crèves were, if possible, superior to the Houdans, and we think Mr. Dring was fairly beaten this time. Malays a grand lot, and seventeen entries. In this class Mr. Hinton showed the best-looking pen, but in this case the crooked appearance of the back did not escape the Judge; they were unnoticed.

In the *Americans*, Brown Leghorns, Whites Leghorns, and a pen of Plymouth Rocks competed. Silkies followed, of which there were some admirable specimens. For Any other variety the first prize went to a good pen of Minorcas.

Bantams.—In Game Mr. Auns achieved another great victory, but not we think with his Brighton bird; the cockerel we considered here not so good in the head, but in other respects superior. The Brown Reds were moderate. In the Any variety class Mr. Brownlie again won with his beautiful Piles; the cockerel we think the best we have seen for a long time. Blacks were a strong class and well judged. In the Sebrights Mr. Leno has at length had to succumb, a very magnificent pen of Golds belonging to Mr. Braund winning; they were only entered at ten guineas, a bargain which we have no doubt was quickly caught at.

Ducks.—Ayreshury a small class, Mr. Fowler winning easily. Rouens very large, and containing four or five first-class pens. In Blacks Mr. Sausbury cleared off all the prizes.

Very large Selling classes completed the poultry, and here we found the best Spanish cockerel in the Show.

The *PIGEONS* were well represented; the entries reached four hundred. It was gratifying to hear the very great satisfaction experienced by nearly all the old fanciers at the judging.

Carriers.—Among the old cocks we very much liked Pen 1021, and thought he deserved a position in the Show. Mr. Yardley won with a grand bird, having all the essentials of a Carrier. The young class contained a splendid lot, nearly all the birds being noticed; next the winners we liked the pens shown by Lt.-Col. Hassard and Mr. Hammock. In *Pouters*, Whites carried both first prizes over the Pieds. *Barbs*.—We preferred Mr. Maynard's pen to the winners. *Almonds* were a beautiful class. *Dragoons*.—Red and Yellow did not come out so strongly in number as we anticipated, but the quality was first-rate. The Any other colour was a large class, and must have given the Judges a little trouble. *Owls*.—In Foreign Mr. Allen won with a superb pair, but a little out of condition. *Turbits*, *Fantails*, and *Jacobins* were a fine lot, and the awards satisfactory.

DORKINGS (Coloured).—1 and Cap. S. Newick, Hinton St. George. 2, J. White, Warlaby, Northallerton. 3, T. C. Burnell, Mickledever. 4, L. G. W. Stratford, West Malling. *Ac. J.* Taylor.

DORKINGS (Blue).—1, R. Gamon, Dorking. 2, H. Allen, Wood Green. 3, J. W. Putney, Dorking. Local Prize, J. T. Castell, Oxford.

DORKINGS (Silver-Grey).—1, O. E. Cresswell, Early Wood, Bagshot. 2, W. Roe, jun., Newark. 3, J. Robinson. 4, L. Wren, Lowestoft. Local Prize, S. Salter. *hc*, W. W. Knithledge, Kendal; O. E. Cresswell.

DORKINGS (Any other variety).—1, Mrs. M. A. Hayne, Fordington. 2, L. G. W. Stratford. 3, O. E. Cresswell. *hc*, J. Robinson, Garstang; Miss E. Williams, Henllys, Berwick; Mrs. M. A. Hayne.

SPANISH.—1, J. Pitt, Wolsingham. 2, J. Palmer, Acton. 3, H. Beldon, Bingley. Local Prize, H. Jones. *hc*, J. R. Kodard, Warrington. *c*, Mrs. T. Dean, Brierley. 4, G. H. Clifton, Colburn, Bristol.

COCHINS (Cinnamon and Buff).—1, K. P. Percival, Northenden, Manchester. 2, Lady Gwydyr, Ipswich. 3, Henry Lingwood, Rarking, Needham Market. *hc*, W. A. Burnell, Southwell, Notts; J. Swinson, Chipping Campden; T. Scar, Aylesbury; G. J. Nelson, Southwark Street, S. E. *c*, W. A. Burnell; W. P. Ryland; H. Tomlinson, Gravely Hill, Birmingham.

COCHINS (Particolored).—1 and 2, E. F. Indman, Whitechurch, Salep. 2, G. Lamb. *hc*, R. P. Percival; J. H. Jones, Handforth; Hon. Mrs. Scales; T. M. Derry, Gellney. *c*, Mrs. H. Story, Lockington Vicarage, Derby; Hon. Mrs. Sugden, Wells (2); Mrs. E. Pryor, Welwyn.

COCHINS (Black).—1, E. Kendrick, jun., Lichfield. 2, Lady Gwydyr. 3, G. C. Athole, New York. *hc*, H. Beldon; T. Asplen, Church (2); Mrs. Taaffe, Tulse. *c*, Mrs. Taaffe.

COCHINS (Any other variety).—1 and 2, R. S. Woodgate, Pembury, Tunbridge Wells. 3, T. Atterton, Leighton Buzzard. Local Prize, J. Cradock. *hc*, W. A. Burnell; J. K. Fowler; J. Turner; J. Cradock. *c*, Miss H. Williams.

BRAMHMS (Dark).—1, Hon. Mrs. B. Hamilton, Ridgmont, Woburn. 2 and 4, T. F. Ansell, Cowley Mount, St. Helens. 3, Horace Lingwood, Creeting, Needham Market. Local Prize, J. Gee, Oxford. *hc*, T. F. Ansell; Hon. Miss D. Pennant, Penrhyn Castle, Bangor; M. Leno, Markate Street; J. Watts; J. Harvey, jun., Thannington, Canterbury. *c*, Hon. Miss D. Pennant; W. R. Garner, Dyke; H. Hadroff, Calne.

BRAMHMS (Light).—1 and 2, C. H. Wakefield, Malvern Wells. 3, Horace Lingwood. 4, P. B. Bates, Palace, Diss. Local Prize, T. Smith, Charlbury, Oxon. *hc*, R. P. Percival; G. & W. Smith, Bath; Mrs. Peet, Sharnbrook; T. A. Dean, Marden, Hereford; M. Leno; G. W. Vetter, Streatham Grove, Norfolk; Mrs. W. E. Drummond, Bath. *c*, K. C. Horsfall, Grassendale Priory; H. M. Maynard, Holmwood.

GAME (Black-breasted Red).—*Cockerel*.—1, S. Matthew, Stowmarket. 2, T. P. Lyon, Liverpool. 3 and Local Prize, Miss Osborn, Yarnout. *hc*, P. A. Lock, Walsby. 4, S. G. H. Lamb, Bicester. 2, Walker, Gomersall; D. Harley, Edinburg. 3, S. F. H. Pullet. 1, Major J. Newgate, Tong Long, Bristol.

2, J. Mason, Worcester. 3, J. Forsyth, Wolverhampton. Local Prize, R. J. Pratt, Eastone. *hc*, Hon. and Rev. F. Dutton, Bury Vicarage; A. C. Swain, Beckingham; R. J. Pratt. *c*, W. H. Stagg, Netheravon.

GAME (Brown-breasted and other Reds).—*Cockerel*.—1, R. Ashley. 2, J. Chesters. 3, T. Chesters, Nantwich. Local Prize, Miss Osborn. *hc*, S. Matthew. 4, H. E. Martin, Southport, Fakenham. *Pullet*.—1, S. Matthew. 2, J. Cook, Worcester. 3, J. Carlisle, Enbury. Local Prize, Miss Osborn. *hc*, J. Chesters; Miss Osborn; H. Beldon; J. F. Walton, Raxtenstall; T. Sergeant, Nantwich; H. E. Martin; W. Foster, Deal; R. Payne, Banbury.

GAME (Any other variety).—*Cockerel*.—1, E. Aykroyd, Eccleshill. 2, J. Mason. 3, J. F. Walton. Local Prize, W. Pratt. *hc*, J. Goodwin, Liverpool. *c*, B. Bell, Burton-on-Trent. *Pullet*.—1, J. Goodwin. 2, E. Wiswood, Worcester. 3, J. Mason. *hc*, Hon. and Rev. F. Dutton; E. Aykroyd.

HAMBOURG (Gold pencilled).—1, G. & J. Duckworth. 2 and 3, H. Beldon. Local Prize, J. T. Castiel. *hc*, J. Walker, Ripley, York; T. Wythe, jun., Melton Mowbray; W. Speakman, Nantwich; T. & W. Fawcett, Baldon. *c*, Ashton & Booth.

HAMBOURG (Silver-pencilled).—1, Duke of Sutherland, Trentham. 2, H. Beldon. 3, J. Webster. *hc*, H. Beldon; J. Robinson; J. Long.

HAMBOURG (Gold-spangled).—1, J. Long. 2, G. & J. Duckworth, Church. 3, Duke of Sutherland. Local Prize, J. Calcutt, Witney. *hc*, H. Beldon; T. E. Jones, Wolverhampton.

HAMBOURG (Silver-spangled).—1, Ashton & Booth, M. 4, tram. 2, H. Beldon. 3, J. Messer. Local Prize, J. Gee. *hc*, H. Beldon; Duke of Sutherland; J. Robinson; J. Long, Bromley Common, Kent.

HAMBOURG (Black).—1, Rev. W. Serjantson, Acton, Barnell, Shrewsbury. 2, H. Beldon. 3, Stott & Booth, Local Prize, E. Brooks, Oxford. *hc*, H. Hovle, Newchurch. *hc*, H. Beldon; Rev. W. Serjantson; C. Leake, Bromfield. *c*, C. Stogwell, Ryddlesden Hall, Keighly.

POLANDS (Black with White Crests).—1, A. Darby, Little Ness, Shrewsbury. 2, T. Dean.

POLANDS (Any other variety).—1, 2, and 3, G. Adkins, Lightwoods, Birmingham. *hc*, T. Dean.

HODDANS.—1, Rev. C. Handley, Baltonsborough. 2 and 3, R. B. Wood, Uttoxeter. Extra 3, Miss C. G. Nevill, Buteigh Vicarage, Glasbury. Local Prize, Rev. G. Day. *hc*, C. Hill, Alton; W. Dine, Faversham; G. W. Hibbert, Godley, Hyde; W. O. Quibell, Newark; J. K. Fowler; H. Grant, Bradford; W. A. Peel, Watford; C. Morris, Upton Lawn, Chester. *c*, W. Culick, jun., Littleport; J. D. Harrison, Camforth; R. A. Boissier, Peshawar; R. B. Wood (2); W. H. Coppleson, Lostwithby; M. H. Sturt, Fussy; G. de Fay, St. Huier, Jersey.

FRENCH (Any other variety).—1 and 2, R. B. Wood. 3, W. Driag. *hc*, Mrs. A. Tindal, Aylesbury; J. K. Fowler; G. de Fay; Rev. C. C. Ewbank, Dallington Vicarage. *c*, Rev. T. C. Beasley.

MAJAYS.—1, G. Burnell, Rug ley. 2, S. Elliott, jun., Liskeard. 3, Capt. C. Terry, Reading. *hc*, W. H. Huxtable, Landkey, Barnstaple; F. Sabin, Birmingham (2); E. Bradford, Whissonsett.

AMERICAN FOWLS.—1, R. K. Fowler. 2, J. Long. 3, W. B. Wignall, Birkenhead. Local Prize, R. Harvey. *hc*, W. B. Wignall; A. Kitchen, Westerham; R. B. Day, Rickmansworth.

SILKIES (White).—1, R. S. S. Woodgate. 2, S. P. Broad, Reigate. 3, A. Darby. Local Prize, Mrs. L. Harvey. *hc*, J. Watts; R. S. S. Woodgate; Mrs. J. F. Holmes.

ANY OTHER VARIETY.—1, J. Crooke, Wallington (Minors). 2, H. Feast, Swansea. 3, Miss C. G. Nevill, Buteigh Vicarage, Glasbury. *hc*, T. B. Wood, Salisbury (Black Minors); A. E. Cresswell (White Guinea Fowl). *c*, J. Crooke (Minors); J. Watts (Friszled).

GAME BANTAMS (Black Reds).—1, W. F. Anns, Glastham. 2, W. F. Addie, Preston. 3, Miss E. H. Entwistle, Bradford. Local Prize, S. Salter, Egrove. *hc*, R. Brownlie, Kirkcaldy; A. Ashley, Redhill, Worcester; Mrs. G. Hall, Kendal; G. Hall, Kendal; T. Bradbury, Buckingham. *c*, J. Nelson, Hexham.

GAME BANTAMS (Brown and other Reds).—1, S. Beighton, Farnsfield. 2, T. Barker. 3, Miss E. H. Entwistle. *hc*, Miss E. H. Entwistle; T. Barker.

BANTAMS (Any other variety).—1, R. Brownlie. 2, J. Nelson, Hill End, Burnley. 3, S. Beighton. *hc*, J. Nelson; Miss E. H. Entwistle; Bellingham and Gill, Burnley; J. Eaton, Grantham; P. Unsworth, Loxton, Newton-le-Willows. *c*, E. Walt, Horncliffe, Raxtenstall; A. Smith, Halifax.

BANTAMS (Black, Clean-legged).—1, W. H. Robinson, Keighly. 2, J. Earnshaw, Rotherham. 3, E. Cambridge, Bristol. *hc*, J. Pearson, Lichard; J. M. Gloucester. *c*, H. Beldon (2); T. Dyson, Halifax; W. H. Young, Driffield.

BANTAMS (Sebright).—1, F. Brand, Bideford. 2, M. Leno. *hc*, M. Leno; J. Wholy, Kingston. *c*, C. H. Poole, Bridgwater.

BANTAMS (Any other variety).—1, Duke of Sutherland. 2, H. B. Smith, Bronzton, Preston. 3, Rev. E. T. Farie, Gazeley Vicarage, Newmarket. *hc*, J. Greig, Durrington Manor House; R. S. S. Woodgate. *c*, H. Feast.

DUCKS (Aylesbury).—1, 2, and 3, J. K. Fowler. Local Prize, H. T. Sotham, Watlington. *hc*, W. Walker, Rochdale; T. Kingsley; T. Scar, Aylesbury; J. Hedges, Aylesbury.

DUCKS (Rouen).—1, F. Parlett. 2, J. Nelson, Hexham. 3, P. Unsworth, Local Prize, Duchess of Marlborough, Blenheim. *hc*, Hon. Mrs. Vernon,

Kettering; Duke of Sutherland; J. T. Billinge, Penrith, Wigan; H. Dowsett, Pleshev. *c*, J. Watts; G. E. Martin, Bath; J. H. Hoyt.

DUCKS (Black East Indian).—1, 2, and 3, G. S. Sainsbury, Devizes. *hc*, G. S. Sainsbury (2); J. W. Kelleway, Merston, Isle of Wight. *c*, J. W. Kelleway; Mrs. M. A. Hayne.

DUCKS (Call).—1, W. H. Young, Driffield. 2, R. Richardson. 3, Duke of Sutherland. *hc*, P. Clatton, Rickmansworth.

DUCKS (Any other variety).—1, R. Wilkinson, Guildford. 2, R. R. Fowler. 3, H. B. Smith. Local Prize, W. R. Pratt, Oxford. *hc*, H. B. Smith (2); M. Leno (3); H. Yardley, Birmingham. *c*, Miss Mill.

TURNERS.—1, Rev. N. J. Ridley, Hollington, Newbury. 2, W. Wykes. 3, J. Walker. Local Prize, H. S. Sotham. *hc*, H. J. Gunnell; M. Kew, Market Overton; Mrs. A. E. Mayhew, Chelmsford. *c*, C. Kendrick, jun.

GESEES.—1 and 2, J. K. Fowler. 3 and Local Prize, Duchess of Marlborough. *hc*, E. Snell.

SELLING CLASS (Brahmas, Dorkings, and Cochins).—*Cocks*.—1, F. White. 2, J. Walker. 3, Col. C. A. Cobbe, Adderbury West. 4, Countess of Dartmouth, Alington. *hc*, Hon. Mrs. B. Hamilton. *hc*, R. P. Percival; T. Smith; W. B. Richardson, Maux Abbey, Beverley; W. A. Burnell (2); W. R. Garner; A. Palmer; R. Harvey; T. A. Dean; C. Sidwick; J. Watts; T. J. Saltmarsh; Chelmsford; H. Tomlinson; Mrs. H. Shutt, Worcester; Mrs. Somerville; J. Hedges; H. Yardley. *c*, W. Jervis (2); M. Leno; Mrs. H. Foulkes, Llandysil.

Hens.—1, W. B. Howard. 2, J. Cowsett.

SELLING CLASS (Brahmas, Dorkings, and Cochins).—*Hens*.—1, T. Kingsley, Tring. 2, Countess of Dartmouth. 3, J. Watts. 4, W. A. Burnell. *hc*, R. P. Percival; G. & W. Smith; H. J. Gunnell, Milton; Mrs. A. C. Smith; C. Kendrick, jun., Lichfield; J. Gorin, Steyning; J. N. Whitehead, Bridgewater; W. A. Peel, Watford; F. Rayner, Shanklin; Countess of Dartmouth (2); J. Hedges; E. Shaw, Plas Wilnot, Oswestry; S. Salter; H. Yardley; T. P. Caiver, Langthorpe, Boroughbridge; F. Bennett (2). *c*, J. Watts; H. Dowsett.

SELLING CLASS (Any other variety).—*Cocks*.—1, W. B. Howard. 2, Rev. N. J. Ridley (La Fleche). 3, J. D. Harrison, Grange-over-Sands (Houdans). 4, W. H. Start. *hc*, J. T. Parker, Northampton (Spanish); E. Smith, Maldon (Houdans); Miss Mill, Rickmansworth (White Leghorns); H. Brown, Putney Heath; J. Fearney, Nextstone-Willows; F. P. Morrell, Oxford; Countess of Dartmouth; A. Bentley, Rickmansworth; C. G. Cave, Spalding.

SELLING CLASS (Any other variety).—*Hens*.—1, E. Pritchard, Wolverhampton. 2, C. Bloodworth. 3, J. Chiman (Houdans). 4, J. T. Parker (Spanish). *hc*, J. F. Pauling, Thrapston; J. Walker. *c*, Rev. T. C. Beasley.

SELLING CLASS (Bantams).—1, Mrs. G. Hall. 2, M. Leno. 3, G. Hall. *hc*, S. and J. J. Stephens, Ebley; R. R. Fowler, Aylesbury; Rev. F. Pearle; T. Barker; T. W. Anns; E. Walton; W. Shenton; M. Leno.

SELLING CLASS (Ducks).—1, J. Gee. 2, J. Hedges. 3, Haslam & Seotson, Hindley Common. 4, T. Kingsley. *hc*, Duke of Sutherland (Rouen); J. K. Fowler. *hc*, G. S. Sainsbury (Black East Indian) (2); Mrs. A. Tindal; J. Watts; J. Hunt; E. Shaw; S. Salter; J. H. Hoyt; H. Dowsett. *c*, C. Snell.

PIGEONS.

CARRIERS (Black or Dun).—*Cock*.—1 and 3, R. Fulton. 2, H. Yardley. Local Prize, S. Salter. *hc*, T. D. Baddeley, Hereford; W. Nimson, St. Ives. *hc*, Col. F. Hassard, Sheerness. *c*, J. Baker. *Hens*.—1, H. Yardley. 2 and *hc*, W. G. Hamcock, Hford. 3, R. Fulton, New Cross. *c*, R. Cant; H. M. Maynard, Holmwood, Isle of Wight (2).

CARRIERS (Any other colour).—*Cock*.—1, E. C. Stretch, Ormskirk. 2, Col. F. Hassard. 3, S. Salter. *hc*, W. G. Hamcock. *Hens*.—1 and 3, W. G. Hamcock. 2, E. C. Stretch. *hc*, S. Salter. *c*, J. C. Ord, Farnley.

CARRIERS (Any other colour).—*Young Cock or Hen*.—1, A. Billevald. 2, W. Nimson. 3, Col. F. Hassard. Extra 3, R. Cant, Brompton Road, S.W. Local Prize, T. Wyatt, Oxford. *hc*, W. G. Hamcock; W. Quiskall, Shanklin; Col. F. Hassard. *hc*, T. Wyatt; E. C. Stretch; W. G. Hamcock; W. Massey, Spalding; R. Cant; H. M. Maynard; J. C. Ord (2); Col. F. Hassard. *c*, W. Massey; J. Calcutt; S. Salter.

POUTERS.—*Cock*.—1, Rev. W. C. Bullen. 2 and 3, R. Fulton. Local Prize, W. R. Pratt. *hc*, R. Pratt, Hampton-on-Urden; W. Nottage, Northampton. *hc*, H. Pratt; N. Hill, Ealing; Mrs. Ladd, Calne. *c*, J. Baker; Rev. W. C. Bullen. *Hens*.—1, Mrs. Ladd. 2, Rev. W. C. Bullen. 3, N. Hill. *hc*, R. Fulton; J. Baker, Kew Bridge. *c*, K. Fulton.

BARBS.—1 and 3, R. Fulton. 2, H. M. Maynard. Local Prize, W. R. Pratt. *hc*, H. Yardley. *hc*, F. Smith; J. Baker. *c*, J. Baker. *Young*.—1, R. Fulton. 2, H. M. Maynard. 3, G. H. Gregory, Taunton. *hc*, F. Smith, Selly Oak, Birmingham.

TURKISHS (Almond).—1, R. Fulton. 2, H. Yardley. 3, J. Baker. Local Prize, W. R. Pratt. *hc*, J. Ford, Monkwell Street, London (2); R. Fulton.

TURKISHS (Short-faced).—1 and 3, J. Baker. 2, J. Ford. *hc*, R. Fulton.

TURKISHS (Long-faced).—1, W. B. Mapplebeck, jun., Birmingham. 2, J. Watts. 3, W. Todd. *hc*, J. Ford.

DRAGONS (Red or Yellow).—1 and 2, E. Graham, Birkenhead. 3 and *hc*, L. Whitehead, Drury Lane, W. C. *hc*, L. Fulton; G. H. Gregory. *c*, H. Bignell, Ishington. 3, S. Salter. *c*, R. Woods, Mansfield.

DRAGONS (Any other colour).—1 and 2, W. D. Richardson, Wells. 3, H. Yardley. Local Prize, C. Herrieff, Banbury. *hc*, F. Graham; W. Smith; W. H. Mitchell, Moseley, Birmingham; J. Philpott (2); C. Herrieff; W. Gamon; R. Fulton. *c*, W. Smith; Ward & Klode; W. Gamon; J. Watts; J. James, Bath.

ANTWEARS.—1, W. Gamon. 2, J. Wright. 3, W. Slater, Gravely Hill, Birmingham. Local Prize, F. Coumbes, Chipping Norton. *hc*, C. Herrieff; B. Hudson, Driffield. *c*, C. Herrieff; J. Wragot; K. Brierley, Bury, Lancashire; H. Yardley.

ANTWEARS (Homing).—1, Powell & Crane. 2, G. A. Evans, Oxford. 3, J. J. Sparrow, Grosvenor News, London. *hc*, C. Herrieff; J. J. Sparrow; J. W. Barker; C. Benwood; W. R. Pratt. *c*, Capt. G. Edwards; G. A. Evans; C. Herrieff; W. Tomlinson; P. Brierley; A. Bentley.

RENTS.—1, T. D. Green, Saffron Walden. 2 and 3, S. Salter.

OWLS (English).—1, H. Verdon, Waverley. 2, R. Fulton. 3 and Local Prize, E. F. Enley. *hc*, J. W. Edge, Birmingham. *hc*, E. Lee; K. Fulton; J. Watts. *c*, D. Herrieff; W. Tomlinson, Oxford; L. Allen.

OWLS (Foreign).—1 and 3, L. Allen. 2, J. J. Sparrow. *hc*, T. Chambers; F. Brand; S. A. Wyllie, East Moulsey; J. Baker.

NEWS.—1, H. Yardley. 2, Rev. A. G. Brooke, Shrawardine. 3, J. B. Bowdon, Blackburn.

TREBITS (Red or Yellow).—1, R. Fulton. 2, J. Baker. 3 and *hc*, O. E. Cresswell. Local Prize, S. Salter. *hc*, H. Yardley; T. Foster, Dunblame Gate, Bingley. *c*, T. Foster; R. Woods, Mansfield.

TREBITS (Any other colour).—1 and 2, Local Prize, S. Salter. 3, J. Baker. 3, G. H. Gregory. *hc*, O. E. Cresswell. *hc*, S. Salter (2). *c*, J. E. Bowdon; J. E. Smyth; J. Watts; G. H. Gregory.

FANTAILS.—1 and *hc*, Rev. W. Serjantson. 2, H. M. Maynard. 3, J. F. Lovelidge. *hc*, R. Fulton; J. Walker. *c*, J. F. Lovelidge; Miss Dickenson; S. Wyllie.

JACOUBINS.—1, R. Fulton. 2, J. Baker. 3, L. Allen. Local Prize, Miss M. E. King. *hc*, J. Banks; R. Fulton; L. Allen, Southwark.

TURKISHS.—1 and 2, R. Fulton. 3, J. Baker.

MAGPIES.—1, 2, and Local Prize, C. Hitchcock, Oxford. 2, J. E. Bowden. *hc*, C. Hitchcock; J. Watts; H. Yardley. *c*, J. Baker.

ANY OTHER VARIETY.—1, R. Wilkinson (Archangels). 2 and 3, S. Wyllie (Grillbacks and Scanderoon). *hc*, L. Allen (Black Beards); H. Yardley; R. Woods. *c*, C. Clifford (Helms).

LOCAL CLASS (Homing Antweaps).—1, J. Cradock. 2, E. Valters. 3, A. M. Turner. *hc*, G. A. Evans; A. M. Turner; W. Tomlinson. *c*, Powell & Crane; W. R. Pratt.

SELLING CLASS.—1, J. J. Sparrow. 2, S. Salter. 3, J. Kendrick. *hc*, J. Ford;

H. Yardley. c, C. Herrieff (2); Miss J. Milward; W. H. A. Müller; S. Salter; J. E. Leward.

JUDGES.—Poultry: Mr. E. Hewitt, Mr. W. B. Tegetmeier, and Mr. R. Teebay. **Pigeons:** Mr. F. C. Esquilant and Mr. P. H. Jones.

DORKINGS AT THE OXFORD SHOW.

As I know it is not in the power of all exhibitors to attend shows I send you the subjoined remarks on the Dorkings at Oxford Show, thinking they may be interesting to some of your readers. Looking at the Dorkings as a whole, I think the most marked progress is to be found in the Silver-Grey class. The Coloured class was certainly not equal to last year.

The cup pen of Coloured birds contained a very nice pullet; the cockerel was also a stylish bird with good feet, but on close examination I thought his right hip bone projected a little. Mr. White's second-prize birds I liked immensely, but they were within an ace of arriving too late. There were several very good single birds, but this pen was good all round; the cockerel large, dark, and good in comb and feet, while the pullet was quite his equal. Third was the cup cockerel at Bath, but his pullet rather small and brown on the wings. The fourth cockerel was a smart dark bird with a good comb, but the pullet was not large and very light in colour, being almost like a Silver-Grey. I must plead guilty to admiring the dark colour for Coloured hens, in order that there may be a marked distinction between them and the Silvers. Mr. Walker's pen was too late, but his cockerel was smallish. Pen 9 (Beachey) would have been good, except for the pullet's toes, which no doubt threw it out; and the same may be said of pen 15 (Gee), the pullet having a broken leg badly set, the cockerel also good. Mrs. Somerville showed a very large pullet indeed, but already showing a bumble between the toes.

The Silver-Greys were, I think, the best class of this variety I have ever seen, and I may say the same of Mr. Cresswell's cup pen, which also took the cup at Birmingham. His cockerel is a thorough Dorking, broad, square, and short on the leg; while his jet-black breast and tail, and pure white hackle and saddle, make him a perfect Silver-Grey. The second were also a neat pen and perfect, but not possessing the size of the first. Third was a large pen, especially the pullet, but the cockerel grizzled on the thighs; fourth a pretty pair, but the pullet smallish, and the cockerel a little too much striped in hackle for a Silver. I also admired pen 19 (Cato), but they were not up to the size. Several pens had dark feet and white earlobes, doubtless great drawbacks in good competition. The pullet in pen 26 was fearfully rusty on the wing.

Cuckoo Dorkings are a variety I particularly admire, and they are well known to be hardy and good layers: the latter I can personally vouch for. How is it more exhibitors do not take them up? Never has any variety presented a better opening for an exhibitor. Mr. Gamon was well first with a nice pen, their faults being darkish feet and white earlobes, but they were very praiseworthy, well marked, and a good match in colour. In most of the other pens the cockerel was too light in colour. The pullet in the second-prize pen was particularly good in colour, but not quite perfect in toes; the cockerel a nice shape. The cockerel in the third-prize pen had a cuckoo tail—a very difficult feature to obtain.

The next class might well have been for *Whites and Yellows*, so many birds were there of a yellow tinge. This objectionable feature is not tolerated by the judges in most white breeds, and I live in hope of seeing the day when the same may be said of White Dorkings. The first-prize pen of Whites were certainly the largest, but the cockerel leggy. The second-prize birds seemed very yellow to me, while the toes on the cockerel's left foot were very rudimentary. Third a nice pen. Pen 41 (Pilgrim), was very white in colour, good in comb, and was quickly claimed (£2 10s.). Pen 42 (Robinson), contained the largest pullet in the class. Pen 46 (Cresswell), was the Birmingham cup cockerel, and particularly good in colour, comb, and shape. Pen 50 (Tearle), also very good in colour, but hardly large enough. I append my name in order that exhibitors may take the above remarks for what they are worth, and shall be only too glad when brother fanciers will do the same for me.—T. C. BURNELL.

GUISBOROUGH CANARY SHOW.

THE following awards were made at this Show, held on October 30th and 31st:—

NORWICH.—Clear Yellow—1 and 2, J. Adams. 3, J. Stevens, Middlesbrough. *he*, Moore & Wynne, Northampton. c, Quinn & Son, York. *Clear Buff*—1 and 2, J. Adams. 3, H. Winter, Guisborough. *he*, G. Cox, Northampton. c, J. Bexson, Derby.

NORWICH.—Evenly-marked Yellow or Buff—1 and 2, J. Adams. 3, G. Cox. *he*, Moore & Wynne. c, Quinn & Son.

NORWICH.—Ticked or Unevenly-marked Yellow—1 and 2, J. Adams. 3, J. Bexson. *he*, J. Gales, Darlington. *Ticked or Unevenly-marked Buff*—1 and 2, J. Adams. 3, T. Tenniswood, Middlesbrough. *he*, J. Bexson. c, Moore and Wynne.

NORWICH.—Crested—1, R. Hawman, Middlesbrough. 2, W. J. Hampton, Darlington. 3, G. Cox. *he*, Quinn & Son. c, Petty & Cuss, York.

LIZARDS.—Gold or Silver-spangled—1 and 3, Cleminson & Ellerton, Darlington. 2, Holdsworth & Oliver, Harrogate.

CINNAMON.—Jonque—1 and 2, J. Adams. 3, M. Burton, Middlesbrough. *he*, E. Winter, Guisborough. c, J. Bexson. *Buff*—1 and 2, J. Adams. 3, G. Cox. c, J. Bexson.

YORKSHIRE.—Clear Yellow—1, R. Williams, Guisborough. 2 and *he*, E. Winter. 3, J. Williams. c, J. C. Hewison, Guisborough. *Clear Buff*—1, W. Winter, Guisborough. 2, J. Stevens. 3, J. Garbutt, Great Ayton. *he*, J. Pearson, Great Ayton. c, L. Belk, Dewsbury.

YORKSHIRE.—Ticked or Unevenly-marked Yellow or Buff—1, J. Stevens. 2, J. Rowland, Skelton. 3, J. Williams. *he*, W. Carrick, Middlesbrough. c, J. Garbutt.

GREEN.—Clear—1, J. Rowland. 2, J. Stevens. 3, T. Tenniswood, North Acland.

COPPY.—Crested—1, J. Garbutt. 2, L. Belk. 3, J. Stevens. *he*, J. Sedgwick, Stockton-on-Tees. c, J. Lennard, Guisborough. *Plain-headed*—1, L. Belk. 2, J. Thackray, Bradford. 3, E. Moon, North Ormesby. *he*, J. Stevens. c, J. Garbutt.

CANARY.—Any other variety—1, R. Hawman. 2, L. Belk. 3, Fryer & Hol South Stockton. *he*, M. Burton. c, Johnson & Armstrong, Northallerton.

GOLDFINCH NILE.—Dark—1 and *he*, S. Bunting, Derby. 2, G. Cox. 3, R. HAWMAN. c, Fryer & Holt. *Any other variety*—1, S. Bunting. 2, T. Tenniswood. 3, Moore & Wynne. *he*, J. Stevens. c, H. Winter.

GOLDFINCH—1, S. Bunting. 2, H. West, Darhoughton. 3, W. Bishop, Guisborough. *he*, M. Burton. c, W. Carrick.

LINNET—1, M. Burton. 2, S. Bunting. 3, W. Carrick. *he*, J. Carrick. c, J. Calvert.

BRITISH BIRD.—Any other variety—1, Fryer & Holt. 2, R. Pearson. 3, G. Cox. *he*, J. Rowland. c, W. & C. Burniston.

SELLING CLASS—1, J. Thackray. 2, T. Cleminson, Darlington. 3, W. & C. Burniston. *he*, W. Henderson, Whitby; G. Cox. c, J. Shephard, Guisborough.

CAGE OF SIX—1, Cleminson & Ellerton. 2, T. Cleminson. 3, W. J. Hampton. *he*, S. Bunting.

FOREIGN BIRDS—Rev. F. H. Morgan (Rose-necks).

JUDGE—Mr. J. Calvert, York.

THE TURBIT.

THE shouldered variety is one of the prettiest of our fancy Pigeons, and commands the admiration of all at first sight. It is small, neat, and elegant in appearance; rather short; chest broad and full; active and interesting; good breeder; and can be had in a great variety of colourings; which, in the shouldered birds, gives a pleasing contrast and beauty of plumage peculiar to this variety of Pigeons.

The head of the Turbit is quite peculiar, and differs from any other variety of Pigeons except the Owl, which it somewhat resembles. The head should be broad, full, and short, while the top should be somewhat flat. The beak should be white, broad at the base, like that of a good Owl; but perfectly straight, and cannot be too short. In this point, as well as in size, Turbits have degenerated much in late years—too much regard being paid to frill and purity of marking, at the expense of other equally important points.

"The eye should be large and full, of a dark hazel colour, having the pupil black. A point of great merit is for the eye to be encircled by a buff-coloured lash or cere." Most of the birds imported from England at the present day have a point or peak-crest in place of the shell-crest or turn-crown. They look very neat; but I do not like them as well as the shell-crest. I have never bred a bird with a point or peak-crest from shell-crested birds; but, in most cases, when a shell-crested Turbit is crossed with an Owl, the point or peak-crest is produced; which would seem to indicate that a peaked bird is not as pure as the one with a perfect shell-crest. The point-peak or shell-crest is formed by feathers growing upwards on the head and neck, and coming to the point or crest just above the head. In good birds the neck feathers grow backwards from the throat, forming what is called by fanciers a perfect mane from the crest down to the shoulder, as in good Jacobins. The gullet is also a very important point in Turbits, and is formed by a loose skin, forming a kind of dewlap under the beak, which, in good birds, will continue until lost in the purle or frill, which should be well developed, with the feathers growing each way outwardly from the centre of the breast, and cannot be too large. The better the frill the more valuable the bird; young fanciers seldom paying any attention to other points if the bird is well frilled and comparatively well marked—losing sight altogether of head, beak, and gullet. The secondary wing feathers, greater and lesser wing coverts, and scapular feathers, should be the only feathers coloured in the shouldered birds; the rest of the plumage, including the ten flight feathers, should be pure white. We would remind the beginner that we are describing a perfect-shouldered bird, like the cut above (fig. 115*)—which our artist has re-engraved from the London JOURNAL OF HORTICULTURE, and which we have not yet seen—they always having more or less coloured feathers on the body under the wing, sometimes extending to the rump and thighs. But if the coloured feathers do not show at all when the bird is at rest, and it is otherwise perfect, it would be classed as a good bird. The colouring should be as pure as possible, the following being the recognised colours of the present time in the shouldered birds; Black, blue with black bars; Blue, with white bars, and plain-winged Blues; Silver, with white bars; Silver, with black bars; Silver, with brown bars; and plain Silvers; also, plain Red and plain Yellow. Booted Turbits are not unusual, and are supposed to be of German

* We reproduce the original engraving from the twentieth volume of our new series.—Eds. J. of H.

origin. The Turbit is thought by many to be a native of the south of France, as it is said to be found there in greater perfection than elsewhere. Germany also claims it as one of her own production, which I am inclined to think, with just reason, as most of the varieties and colourings now bred in this country are traceable to Germany. They have been a favourite of mine for years, and I have bred and seen more than twenty-five different varieties and colourings, nearly all of which (except the shouldered birds) can be traced to Germany, and a majority of these also came from that country, many of which were quite well booted, which is not often the case with Turbits brought from England. Brent says that dark tails in the shouldered

birds were not objectionable. I have occasionally seen birds coloured in this way, but did not consider them as a pure variety, but supposed them to have been bred by crossing the shouldered and tailed birds together. Shouldered Turbits without caps are also frequently met with in this country, and were once much more common than now, and are often sold as "shouldered Owls." Most of the specimens I have seen had the appearance of being produced by a cross between the two varieties. The two latter varieties or colourings I have never known any fancier attempt to breed pure; but have only occasionally seen them in the hands of dealers.—Jos. M. WADE.—(*American Fanciers' Journal*.)

Fig. 115.—THE TURBIT.

[The Turbit is without doubt one of the very prettiest of all our Toy Pigeons. In addition to all Mr. Wade says of its beauty there is one point which makes me admire the Turbit, and that is the peculiar soft look of its feathers—a kind of silky downy look which is very pleasing. It looks like a bird fitted for a child or girl to fondle. Mr. Wade prefers the shell-crested to the point-headed. I own I do not. As to which is originally correct, I must add that neither is. The smooth-head is the original. The portraits in the "Treatise," Girtton, Eaton, by Wolstenholme, and down even to Brent, are all smooth-headed. The last-named writer is the first who alludes to any crest at all. As the modern fancy says we must have a crest to the Turbit, by all means let it be the point head; this suits the character of the beak and head, and keeps the bird removed far away from the Nun kind. Booted Turbits are simply atrocious. I also think that, if not English, the Turbit is French, and not German: it is a bird to please the Celt rather than the Saxon, and leg-feathering would utterly destroy its *petite* neatness. The Pouter needs his long legs, which are so conspicuous, to be covered. The bulky Trumpeter needs his legs to be booted to match his heavy-feathered head; but protect na from any small, dapper, neatly-shaped bird being feather-legged. A finely

chiselled face in man needs no whiskers; and as the Empress Josephine said of Napoleon's, "his was one of the few that needed none," so the finer the shape in Pigeons the less need of leg-feathering. I would almost as soon have the Almond Tumbler booted as the Turbit. The blundering-looking Brahma fowl wants his leg-covering, not the perfectly and symmetrically formed Game fowl. Let all in fancy matters be consistent.—WILTSHIRE RECTOR.]

MIDDLESBOROUGH BIRD SHOW.

"WIRE-IN," a fancier once said to me, "and if you are defeated let it be no bar to your future endeavours." There appears to have been no lack of determination on the part of many fanciers in different parts of England to do battle at the Canary Show held at the Odd Fellows' Hall, Middlesborough, on October 23rd and 24th. The very good schedule issued was responded to by exhibitors, who contributed no less a number than 389 entries, to "wire-in" for the respective money prizes and the "specials," which consisted of a five-guinea silver cup, presented by Mr. George Handsome, of Middlesborough, to the winner of the best Mule in the Show; the President's croquet, "Happy as a King,"

valued at £2, to the most successful exhibitor in Classes 1 to 17 inclusive; and the Committee's electro-plated silver cup, of the value of two guineas, to the most successful exhibitor in Classes 18 to 34 inclusive. It appears the principal cup was awarded to Mr. J. Spence, of South Shields; the cruet to Mr. John Adams, of Coventry; and the Committee's cup to Mr. J. Stevens, of Middlesborough. I am pleased to learn that the members of the Middlesborough Ornithological Association can boast of their fourteenth annual Exhibition, brought about, too, by fanciers of the right stamp. I need only mention the names of Mr. R. Hawman (President), Mr. J. Stevens (Treasurer), and Mr. W. Carrick (Secretary), as a guarantee that the Exhibition was conducted in a way worthy of the occasion. Middlesborough is only one of the numerous places in Yorkshire, which county, however, cannot quite lay claim to having as many annual bird shows as there are towns in its divisions—not quite; but it (the county) undoubtedly bears the palm in far surpassing all others in England for the number of bird exhibitions; and, to judge of the number of fanciers the question arises, What becomes of all the birds bred in Yorkshire alone? The question may be answered in this way: The best, or, as the fanciers would term them, the "plums," are kept principally for show purposes, many finding homes in various habitations, and numerous others being purchased yearly by London and other dealers. The breed of Canary styled "Yorkshire" is as peculiar to that part of England as the "Norwich" bird is to the midland and the more southern districts. At the South Stockton Show there were eighty-nine specimens of the Yorkshire breed exhibited, and at the Middlesborough Exhibition there were 101 for competition. The town of Middlesborough is adjacent to Stockton, and is of easy access by the river Tees. It was at the latter place a bird show was recently held, and, as an eye-witness, I will note down a few remarks concerning the respective positions of several of the prize birds at each of the shows.

Belgian birds came to the post in somewhat stronger force, Mr. Hawman taking a first and third, Mr. Moffat a first, Mr. Jobling a third, and Messrs. Fawcett & Anderson occupying second and third positions. The birds were exhibited in two classes—namely, Clear or Marked Yellow, and Clear or Marked Buff. At Stockton Show Mr. Hawman occupied a third position, and Mr. Jobling first.

Norwich (Clear Yellow), although not strong in numbers were well up in colour and condition. Here Mr. Cox, of Northampton, kept Mr. Adams out of the first place with a splendid bird, the latter exhibitor putting in an appearance for second and third with a pair of fiery-looking birds. At the Stockton Show Messrs. Johnson & Armstrong won a second prize in Clear Yellows, but here the bird was not noticed. Clear Buffs.—The first prize, a "clipper," was added to the account of Mr. Adams, who also won second honours. Mr. Bexson, Derby, won the third prize with a fine specimen. Mr. Simpson's bird was highly commended. At Stockton the same exhibitor took the first prize in Clear Buffs. There were only five Even-marked Norwich shown, the contest being between Messrs. Brown and Gayton, Messrs. Moore & Wynne, and Mr. Adams, the latter having to give way to both the Northampton firms, which proved too strong for him. Evenly-marked Buff.—This was a much better class, Mr. Adams being justly awarded first honours, Mr. Cox second, and Messrs. Johnson & Armstrong third. At the Stockton Show the latter exhibitors stood in the front rank, Mr. Adams occupying the second place, Mr. Simpson the third, but not named at Middlesborough. In the Unevenly marked Norwich classes, Yellow and Buff, Mr. Adams was first and second in each, Messrs. Bexson and Hawman each gaining a third prize. In Class 8 Mr. Cockerton entered a bird wrongly.

There were but five entries in Crested Yellow Norwich, Mr. W. J. Hampton winning first honours. Messrs. Cleminson and Ellerton's bird, the second-prize, will appear better when the crest is more developed; third prize, Mr. G. Cox. The Crested Buff class brought up ten entries, but the winner of the first prize was not exactly to my liking, there being some evidence of Copy breed in it. It was shown by Messrs. Brown & Gayton, and claimed by Mr. Hawman, as I was given to understand. The second-prize bird, shown by Mr. Doman, of Nottingham, would have been more in its place had it been first. Mr. Cox was a good third. There were eleven birds exhibited in Class 11, Copy Crests.

Lizards.—What a change in a few days in the Lizard classes! I have an idea that Mr. J. N. Harrison knows something about a Lizard bird when he sees a good one; for, if I mistake not, he himself has possessed above one first-class specimen of this choice breed of Canary. No "chaff," or "dodges," to use a very vulgar expression, could have influenced him in his decisions. I have seen it stated somewhere in print (I cannot just now calculate, as a Yankee would say), that Darlington, so famous for the past two or three seasons for Lizards, held its own. It appears so, judging by the recent achievements at Nottingham, Northampton, Stockton, and, last of all, the present Middlesborough Show. Respecting the latter two in particular there is just this difference: At South Stockton Show Mr. R. Ritchie

had awarded to him first and second prizes for Golden-spangled, Messrs. Cleminson & Ellerton being third; but at the Middlesborough Exhibition Messrs. Cleminson & Ellerton's Golden Lizards were awarded first prize and a very high commendation, Mr. Ritchie being placed in the second and third positions. This looks something like a reversal. Again, in Silver-spangled Lizards, at Stockton Show Mr. Ritchie stood first and second, Messrs. Cleminson & Ellerton at the same Show only being third. Now, at Middlesborough Show, the one I am now reporting, another reversal of the Stockton awards takes place—namely, that of Messrs. Cleminson & Ellerton winning first prize with their only bird entered, thus again compelling Mr. Ritchie to retire to a third position with one of his birds, and having a high commendation for the other. There are other noticeable changes, one of which is worth recording—that of Mr. J. Stevens's bird. At Stockton Mr. Stevens was only very highly commended for his Silver Lizard, but at Middlesborough he stepped in for second honours. Doctors will differ, I am aware, and so will judges. It is not to be wondered at, considering their varied talent. This, in all sober seriousness, is given without any "chaff" whatever. In Class 14 I will do Mr. Ritchie the justice by noting that he well-earned the first, second, and third places with his broken-cap birds. Some of these birds often carry many good points. Such is the case with Mr. Ritchie's birds. The Lizard classes were not to be considered strong classes, for there were but twenty-two specimens in the three classes.

Cinnamons.—The old tale—Mr. Adams being first, second, and third for Jonques, and first and second for Buffs. Still in the latter class there is a bit of a change, for Mr. Adams (at least the Judge) gave a third prize to a capital bird in the Buff class, shown by Mr. Cox. The Variegated class of this breed was thus disposed of—Messrs. Brown & Gayton first, Mr. Brooks second, and Messrs. W. & C. Burniston third.

The *Yorkshire* classes were very well filled, there being no less than 101 birds in the six classes. Messrs. Lenox & Kenwick, W. Lickley, W. Hutton, R. Hawman, J. Garbutt, and George Gott were the principal prizewinners.

Clear Green brought to the post four birds, three of which had prizes given to them. There is something really so "green" about this class that the sooner it is abolished the better if no more than four specimens can be produced. I would suggest the "Any other variety of Canary" class as the most suitable one in which to enter the "Green" birds; but, as the Middlesborough Committee had not provided one, perhaps it will be considered for the next Show.

Mules.—In Classes 25 and 26 there were several very good birds exhibited (nothing sensational) of the Evenly-marked and dark kinds of the Goldfinch and Canary breeds. In Class 27, "Linnet Mule nearest Canary," Mr. Spence exhibited two birds for which he obtained second and third prizes, and Mr. Stevens one for a first prize. The second-prize bird was awarded the cup, as for the best Mule in the Show. One word of advice to the Committee: Do away with the remark "nearest Canary," for I consider it an extraordinary act to give a bird a first prize, and then award a special prize of the value of five guineas to a bird taking second in the same class. The second-prize Mule, if the best Mule in the Show, should have had at least first honours awarded. I do not believe in a premium being given for a specimen because it happens to more closely resemble a Canary. It might, possibly, be of the veriest puny kind.

The other classes were tolerably well filled, and contained many fine-plumed birds of the British kinds. The Selling class had twenty-seven birds in it; and in Class 35, for stuffed birds, reptiles, or animals, there were many well-executed cases. The prize list was given last week.—AN EYE-WITNESS.

PAINTED DOGS.

A curious practice exists among certain tribes of the South American Indians of painting their dogs. The appearance of these animals, as might be assumed, is most peculiar, and a stranger, ignorant of the customs of the people, would be at a loss to account for the peculiarity of their appearance. They are to be seen of all colours—yellow, blue, green, and scarlet; while others are mottled with every variety of tint. A South American traveller, who recently accompanied a party of natives on a tapir hunt, says that it is the custom among many of the tribes of the South American Indians to dye, not only their own bodies, but the hairy coats of their dogs, with brilliant colours obtained from vegetable juice, such as hucic, yellow roca, and indigo. The light grey, often white, hair of these animals favours the staining process, and the effect pleases the eye of their savage masters; but, to a stranger, the effect is fantastical. "I could not," he says, "restrain my laughter when I first scanned the curs in their fanciful coats; picture to yourself a pack of scarlet, orange, and purple dogs."

BRITISH BEE-KEEPERS' ASSOCIATION.—The Ealing Institute, on the 10th inst., will inaugurate their winter session by a lecture

on the honey bee, to be delivered on behalf of the above Association by Frank Cheshire, Esq. The lecture will be illustrated by large and original diagrams, models, and hives with and without living bees.

IVY HONEY.

Our bees here have been extraordinarily active the last week collecting honey from the ivy blossoms. It is so plentiful that cells long empty are now filling fast, and my stocks are getting quite heavy again. This honey tastes exactly like the ivy leaf when chewed in the mouth, and is equally acrid, only of course much sweeter. Will Mr. Pettigrew say that this acrid taste is not existing in the crude syrup gathered in the flower, but is developed in the stomach of the bee when the honey has been re-swallowed and transmuted according to his theory? I have found ivy honey in every respect the same whether in the open cells or sealed-up, with this only difference, that in the open cells it is somewhat more fluid.—B. & W.

HIVES.

A SHORT time ago a correspondent requested me to give a description of the hives which I use and recommend. This woodcut (*fig. 116*), will help him and other readers of the *Journal* to their shape and appearance. There are three sizes—viz., 16-inch, 18-inch, and 20-inch hives; that is their width inside measure, and they are all 12 inches deep. When well filled they weigh respectively 60 lbs., 100 lbs., and 130 lbs. They are made of wheaten straw, neatly and firmly built. They are made in Ayrshire. Very few English skep-makers can produce hives equal to them. I have succeeded in teaching three or four persons only in England to make excellent hives, but they do not make them for sale. In Scotland the makers use tubes in sewing hives, and thereby produce them much neater and firmer than those made in this country. In Scotland the sizes we have used are fast being introduced into practice. A few days ago an apiarist in the north of Aberdeenshire wrote—"Bee-keeping here is in a sort of transition state. A great impulse has been given to it by the publication of your book. The general size of skeps with us used to be from 11 to 13 inches wide inside, and about 1 foot deep. These small skeps are fast going out of use; and 16-inch and 18-inch skeps are in numerous instances used all over the county, as well as in the neighbouring county of Banff. The heaviest hive here that I have heard of belonged to Mr. Gordon, of Gartley, the weight gathered being 164 lbs. gross. Two at New Pitsligo weighed 128 lbs. and 126 lbs. respectively. Mr. Cruickshanks here had one 120 lbs. One was 109 lbs., and two more (one of which was mine), weighed 104 lbs. each. This one of mine gathered 10 lbs. in one day. All were swarms of the present year. Mr. Gordon's and Mr. Cruickshanks' were filled by swarms that came off at the same time and joined together. All were late swarms obtained about the 6th of July."

The mention of such figures astonishes many bee-keepers in England; but let me say for their encouragement, that many bee-keepers in Scotland were equally astonished a few years ago by the published accounts of bee-keeping in my native parish—Carlisle, Lanarkshire. This year Aberdeen and Banff have beaten Carlisle by nearly 20 lbs. per swarm. Let us hope that many bee-keepers of England will emulate the apiarists of the north. I know no reason why they should not surpass the Scotch. Swarming is earlier here, and our climate is better. In 1865 I called on a cousin in Carlisle. He was amongst his bees at the time. "Well, Robert, how are your bees doing?" He answered in these words, "I have some awful swarms; if they get a gie gude turn on the heather, they will be two hunner pounds a-piece." The secret of all this lies in the use of proper hives, and the hives used by us and the advanced bee-keepers of Scotland have not been altered or improved for fourscore years. They are comfortable and capacious domiciles for bees, and easily managed by their owners. Cross-sticks are used in them, to which the bees fasten their combs, and thus they are made secure for travelling. It would be a great gratification to me to be able to commend bar hives as highly as those already noticed. Neither my commendation nor condemnation will interfere much at present with their adoption and use by amateurs. They will have their day amongst such apiarists, will undergo many modifications and improvements, and, when perfected and widely spread, they will probably go into disuse. "Is it because they are made of wood that you venture on making these predictions?" No. Of course

Fig. 116.

all kinds of hives would be better if made well and substantially of straw. The frames inside the hives render their combs moveable. This is their distinguishing feature.

Bar frames can never help bees anywhere. They cannot teach bees anything, and the fewer hindrances we put in their way the faster they get on. Bar frames in bee hives are both unnatural and obstructive. Some may say, "We all know that, but lately we have made our frames without the bottom bars, so that the bees can make their combs $1\frac{1}{2}$ inch longer." This, doubtless, is an improvement which may encourage the advocates of this kind of hive to advance further in the same direction.

Again, bar-frame hives are not made to be enlarged by ekes. Their makers and patrons have not yet thought of making preparations for holding in a single hive 150 lbs. weight of combs. Three of the best bar-framers would be needed to hold so much. The Stewarton hive is made for enlargement, and is managed on a principle. When the bees require space they get it.

Again, if managed on the non-swarming principle, bar-frame hives are filled with brood from side to side. About the swarming season and afterwards it is impossible to get a bar of virgin honeycomb out of them. It should be borne in mind that the bars are placed about half an inch apart; the combs or bars being about 1 inch thick. When honey is obtained plentifully bees build their honeycombs more than an inch thick, sometimes 3 inches thick. They are better architects than their masters, and know better how to furnish their houses than we do. This year I should guess my hives on the moors gained 3 lbs. for every 1 lb. that the bar-frame hives gained standing side by side. We are glad to let everybody know how much our hives weigh; but when I ask the principal bar-frame dealer in this neighbourhood how heavy his hives are, he replies that he does not keep bees for honey.

Another objection to the use of bar-framers by bee-farmers is this, that their combs are more liable to break down in being removed to the moors. There are no cross-sticks to fasten the combs to. This year, in the month of August, though not very favourable for honey, the best of hives gathered from 30 lbs. to 40 lbs. each. Their moveable combs, it is said, make them more profitable than other hives. Their honey can be taken without the destruction of their combs by the honey-extractor. Probably the introduction of this American slinger has given them a popularity for a time. I think it has never been proven that hives with moveable combs are the most profitable. If so, where is the evidence?

To those of your readers who have a preference for bar-frame hives, and who use them with a view to get pure virgin honeycomb, let me suggest the use of hives large enough to hold about fourteen bars, for in such hives the outer bars would be often filled with honey, and not with brood. I am also of opinion that the appearance and quality of bar-frame hives would be greatly improved by having the straw worked into their outer frames by an accomplished Scotch skep-maker.—A. PETTIGREW.

THE ADJUSTING HIVE.—Now that the Crystal Palace Bee Show is a thing of the past, I rather regret not having exhibited and explained the principle of my "adjusting" hive, as it has proved, and will continue to prove, a very successful hive when a large produce of honey is the object desired. Our respected and frequent correspondent "B. & W." is right in his supposition that this hive was described in *THE JOURNAL OF HORTICULTURE* some years since—so long ago, indeed, that a description of it may not be unacceptable again, whilst the interest which the Exhibition created is so fresh in one's memory.

It was in 1847 that the stock hive was first tenanted by a swarm, and in 1848 that the first opportunity offered of testing the capabilities of the "adjusting" system; and on this first occasion it proved satisfactory, the adjuster or remunerator being nearly but not quite filled with honeycomb of 98 lbs. weight. Again, in 1863 two supers worked on this principle were obtained of the weights respectively of 112 and 109½ lbs. net: at the same time I feel confident that in neither of these instances, nor indeed in almost any case, if supers of the same capacity had been simply placed on the stock hive would they have been more than partially filled, for the bees would have been discouraged, and have been a long time in commencing their comb-making, instead of at once clustering and beginning in a small portion of the box of 6 inches only. What, then, is this adjusting system? It is a plan of cheating the bees into a belief that they have just to fill a shallow storehouse of 6 inches in depth with comb. They do so, and quickly too; but they find, to their astonishment perhaps, they must extend their comb 3 or 4 inches more ere they reach the bottom; and so on again and again, working all the harder to fill up the vacant space between their storehouse and domicile.

The original hive on this principle consisted of a stock box, the dimensions being a cube of 12 inches inside measure. The adjuster was 18 inches in depth, and made to slip easily down over this box telescope fashion, and, when resting on the bottom

board, leaving a space of 6 inches only between the top of the stock hive and the bars of the adjuster. In the two sides of the hive are let-in broad racks of hard wood, and in the top box two catches, taking into these racks, to retain the box at any height. Windows give a full view at the back and sides of the adjuster when in any position; and lifting it causes no disturbance whatever to the bees, which continue to work uninterruptedly during this simple operation. Perhaps I may modify the dimensions; for, since inspecting the hives in the late Exhibition I have, as well as many others, picked up many hints respecting sizes and other details which may be advantageously applied to this hive; but the arrangement of frames in the stock box and bars in the adjuster have been carefully carried out almost from the first, as well as the attachment of small pieces of guide comb or impressed sheets of wax to the bars.

After all there are disadvantages accompanying these large supers. There is always great danger of combs averaging 10 or 12 lbs. weight separating from their attachments, for, of course, frames are not available in the top box; and again, the difficulty of slinging the honey from such very large combs, unless one of these valuable pieces of bee-furniture were made specially for them, somewhat larger, unfortunately, than they already are. No slingers were dreamed of when this hive was invented. Then there is the great difficulty of sending into the market boxes of such weight and dimensions, but for your own table nothing could be more beautiful than the sealed combs cut out as required. At all events one adjusting hive in your apiary, with your whole attention when necessary devoted to it, would be a source of great pleasure. There is no hive better adapted for the uncertainty of a season's honey harvest. You might obtain the first 6 inches in depth in a poor season, or perhaps half the depth of the adjuster in a tolerable one; or, again, the whole depth of 18 inches in a good season.

I think I may look forward, if all is well, to show and explain one of these hives at the next Crystal Palace bee show; and also, perhaps, see whether I cannot induce my bees to give me a few of the beautiful shallow octagons similar to those which our Scotch friends exhibited. Perhaps they will at the same time obtain a few bell-glasses of honey equal or superior to the one exhibited by—GEORGE FOX, *Kingsbridge*.

In your report of the Crystal Palace Bee Show of Sept. 17th notices is taken of the excellent hive exhibited by Mr. C. N. Abbott—a veritable Woodbury with improvements, costing only 3s. You add, "If the spirits of the departed can take an interest in things mundane, how gratified the shade of our late esteemed correspondent Mr. Woodbury must be at finding that no excuse can now be made by the poor man that scientific hives are too expensive for his use." Now I think it is only justice to our departed friend to say that complete Woodbury hives were manufactured by his carpenter at the small cost of 2s. These cheap hives, however, were only dignified with the name of packing-cases and used by Mr. Woodbury as such, but they were as good as the cheap hives exhibited at the Crystal Palace, and scarcely to be distinguished from them. One of these packing-cases and a copy made by myself have been in constant use in my apiary for ten years; and although the wood is only half an inch thick, they have proved themselves as good for wintering stocks as the more expensive and most substantially constructed boxes. I prefer thin-wooded hives for bee-sheds, as they need no ventilation when their crown boards are covered with carpet or any warm material.—R. S.

ENTRIES AT THE CRYSTAL PALACE SHOW.—We are informed that these amount to no less than 4378.

OUR LETTER BOX.

FOWL'S CROP HARD (*Constant Reader*).—If the crop is hard and does not empty itself in the proper manner, there is something that has difficulty in passing into the gizzard. It is generally hay, hair, or dry grass, which forms a ball; at other times it is something indigestible that has been swallowed, or something that swells like sponge or cork. We have known an excessive meal of wheat, followed by copious drinking, produce the same effect. We have known cases where the crop has burst outwardly from the swelling of food within it. As soon as you have read this get some warm, almost hot water, and pour it down the bird's throat, holding its head up that you may be sure it reaches the crop; manipulate it delicately. If you find it becomes softer continue, and as soon as it yields to pressure then give a tablespoonful of castor oil. This generally gives relief. If nothing will soften it, then it must be opened. Take a sharp knife or razor, and having picked the feathers from the front of the crop in a straight line downwards, cut it open, remove the contents, wash the inside with warm water; sew up first the crop, and then the outer skin; be sure to sew them separately; sew them with coarse thread, and rub the suture thoroughly with grease. The bird must be fed for some time on gruel, and will soon recover.

HOUDAN COCK'S TOP-KNOT (*Old Subscriber*).—It is not a fault for a Houdan cock to have such a top-knot as you describe. It is always made of straight hackle feathers. Poland and all crested-fowl fanciers have dreamed for years of a cock with a hen's top-knot, but it has not been accomplished. It is not the rule that colour comes with age in a Houdan cock, but it often

does. You may overlook the dirty buff and yellow, but red feathers are inadmissible.

POINTS OF GAME BANTAMS (*Weekly Reader*).—First be careful both cock and pullet have legs of the same colour, then see that your cock has a scanty tail, but with well-developed sickles; the tail should be carried sloping; the wings close up, clipped to the body, and not drooping like a Sebright; plumage hard, and the condition startling.

FOWL'S MERITS (*H. II.*).—All the other parts being equal, weight should decide in favour of the older bird.

EXHIBITING POULTRY (*R. S. A.*).—Shows are now so much better conducted, and the feeding is so well understood, fowls do not suffer as they used to do.

CANARY AT THE NOTTINGHAM SHOW.—In answer to several communications, we are of opinion that even if there is not a prohibitory rule, yet those who exhibit birds not their own act deceptively. If the birds win prizes the birds give a recommendatory character to the aviaries of the exhibitors, and purchasers are liable to be misled. If "NOT THE EXHIBITOR'S OWN" were written legibly on a card and fixed on the cage, and the same printed in the catalogue, there would be no objection to the showing another owner's birds.

OLD COMBS IN HIVE (*I. I. M.*).—The combs in your hive are too old and black for further use to bees. A swarm next year will do better in an empty hive than amid such combs. Melt them down for wax.

BEES DESERTING THEIR HIVE (*A. Z.*).—It is quite impossible to say where your deserter bees are gone. They may have returned to the other hive, but if they were in possession of the new hive in August, two months after swarming, it is hardly likely. Have you been infested with wasps? So me hives about here have been ruined utterly by them.

REMARKS.

28th.—Foggy early, but soon cleared off; the day warm and fine; but rain at night.

29th.—Morning fair, but dull; afternoon fine; but the evening wet.

30th.—Rain in the night and morning, and great part of the day; fine for a short time between 2 and 3 P.M., but wet afterwards.

31st.—Rather hazy and damp forenoon; drier in the afternoon and evening.

Nov. 1st.—A slightly dull day, and colder than it has been lately; foggy at night.

2nd.—Damp morning; rain in the past night; but fair by 11 A.M.; and beautifully fine afternoon and evening.

Very little difference in the temperature from that of last week, but the range has been rather less; there having been little sunshine the maxima have been lower, and the nights having been cloudy or foggy the minima have been higher.—G. J. SYMONS.

COVENT GARDEN MARKET.—NOVEMBER 4.

The supply continues good, and meets every requirement, so that prices are nearly stationary, and do not influence the general transactions to any extent. Continental produce comes to hand in good condition, and receives considerable attention, especially for the northern markets.

AURICULAS.—No. I.

RECENT notes upon Auriculas tempt me to offer some while those are comparatively fresh. Mr. Douglas has given an account of the flowers he met with in the hands of a representative grower in Scotland. I am more conversant with the collections in Lancashire and Yorkshire, counties which may be called the equatorial regions of Auricula-growing, and indeed the torrid zone of fervour and enthusiasm about them. This, for the simple reason that there are more of us together here; and not that there is less sincere attachment to the flower either among the growers in the highest northern latitudes across the Border or in florists of the south, who, like "D., Deal," represent the antarctic circle of Auricula culture.

There are yet so few truly first-rate florists' Auriculas in any of the four classes, but still so good material to work from in what there are, that there is much encouragement, as well as much need, to make careful efforts at improvement through seedlings.

Green edges take rank as the highest class; there is such a bright effect in the complete contrast between all the zones of colouring in the flower, in its tube, paste, ground colour, and edge; moreover, a fine green edge is bound to absolute purity of the green, and this is a very difficult property to obtain. Grey and white edges may, without losing their character, be more or less grey and white, but there must be freedom from all specks of meal upon the green edge—no Daisies on the lawn! Faults to be overcome in this class, which are at present notable and common, are starchy petals, as in Colonel Taylor and Imperator; impurity of the green through meal creeping over it, as in General Niell and Prince of Wales; and insufficient breadth of edge, through which, in such flowers as Star of Bethlehem or Duke of Wellington, the body colour dashes at each side of a petal—a grave fault that makes the roundest flower look heavy and angular.

The best green edges we have—and I name only those that are really pure—are Page's Champion, a noble grower with me, pip round-petalled and flat, edge light emerald green, and ground colour a mixture of red and violet plum; Booth's Freedom, with the edge the darkest green of all and very rich, body colour intense black and velvety; Trail's Anna, a seedling from this, like its parent in colour and edge, but with a different play of feature—a better trusser too, Freedom being anything but free in blooming. My best plants have sometimes given me six pips, but four are a fair offer for Freedom. Then comes Leigh's Colonel Taylor. I know an old grower who gave five guineas for his first plant of it. It is shy of increase, and will always be expensive. Colonel Taylor is at times caught superior to all his faults, and is then a full, rich, green edge, with body colour almost black; not a large flower, nor yet too small if kept to a truss of five or six pips. Trail's Prince of Greens is a coming king, with only the weakness of a pale tube. It will carry the

largest head of correct and even pips of any Auricula I know. It is a plant of most stately habit, with every property, perfect in paste, ground colour, and edge; the ground is a rich black, laid on in lively markings, and the edge a rich deep green. To this noble fellowship we may, perhaps, admit Litten's Imperator for the sake of what he can be, but he is generally not that. It has been known as the most perfect green edge, and as a flower without one florist's point of virtue to commend it. The raiser must have had either a lucky maiden bloom or strange faith in this disappointing seedling! It can come horrible wholly or in part, but when right is a vivid light grass-green, with black and dashing body colour.

The grey edges are a strong class. They take the lead in roundness, breadth, and smoothness of petal, as shown in the Ringleader family, a sub-class, to which belong such as George Lightbody and Lancashire's Lancashire Hero (old Robin who raised this is yet alive, and comes to see my bloom). But the grey edges have their faults also. Some of them are "undecided edges," the green showing distinctly through scattered meal, as in Lovely Ann and Trail's Sir Charles Napier. Many in this class are also sadly irregular and insufficient in depth of edge. This is quite a sub-class failing with the blue-and-mauve violet-ground greys, such as Maria, Sophia, Col. Champneys, Queen of Violets, Sophia Dumaresque, and Moore's Violet, the probable parent and ancestor of them all.

Mr. Douglas came upon one of the very best grey edges when he saw Kay's Mr. Meiklejohn. Nothing surpasses it as I have bloomed it. It is new, and if true to its promises it is indeed a gem. It is most like George Lightbody and Conqueror of Europe combined in one grand flower. There is the dash and nearly the size of Conqueror without its coarseness, and the fine form and substance of George Lightbody without its frequent want of life in the body colour and of decision on the broad edge. Plant takes after Conqueror—healthy but not large; foliage long, narrow, thick, much veined, and roughly serrated, green, and more abundant than in Conqueror.

Other great greys are Lancashire Hero, Headly's George Lightbody, Sykes's Complete, Smith's General Bolivar, Headly's Charles Brown (exceedingly like the last), Kenyon's Ringleader, Grimes' Privateer, and Walker's George Levick, a rich silvery grey, full of life and brilliancy throughout the flower, which will rival George Lightbody. These all possess the black body colour so dear in the sight of the old Lancashire florists that they are colour-blind to any other—despising under the one reproachful term of "chaney" all the lovely shades of violet, red, and chocolate that add so much to the variety and beauty of a collection of Auriculas.

Other good greys are Richard Headly, very late, and Fletcher's Mary Anne, a chilly severe flower, with a small cold eye, and generally very correct. Chapman's Maria is a belle, her edge almost white, and body colour a liquid violet blue. Sophia, her sister, is very pretty, with a red violet ground, but neither of them is a show flower with us, the body colour occupying far more than

its fair proportion, and dashing through the edge. Colonel Champey, an intensely rich light flower in colour and edge, has the same fault; but they are all very pretty among the rest, so I grow them on the home stages, though as florists' flowers they must suffer the penalty of a certainly unpardonable fault.

There are other fair grey edges competent sometimes to give exhibition flowers in Campbell's Confidence, Lightbody's Sir Charles Napier, Maclean's Unique, Fletcher's No Plus Ultra, and Waterhouse's Conqueror of Europe. The last two are a pair with such pips for size that nothing else matches them. They are seldom good at their biggest, and get to be coarse in all sizes above that of a halferown.

Notes on white edges and selfs I will offer in the next number of the Journal that has room for them. I will merely add now a cultural hint. November is a month in which the Auricula-grower can ill-afford to neglect two of the golden rules of Auricula-growing—*supply of air and cleanliness*. The plants must be protected from wet overhead in imitation of Nature's dry coverlet of snow, that excludes from dormant plants two unneeded stimulants at once—light and moisture. But as our varieties of Auricula do not so much die down as their wild sisterhood, light and air are always a necessity to them, and must freely be secured in any protection professing to be safe.

Everything about the Auricula, which is itself a plant of the very neatest habit, should be always in the best order. In this mouldy month pots kept free from green slime, the soil from moss and crust, the plants from withered leaves and everything stagnant and rotten, will all conduce to keeping the stock in health at a time which is only a terror to evildoers—the careless growers. Though green fly is less a nuisance now, yet keep them all off; and on this point I prefer a cleaner method of abolishing the enemy than with the tobacco powder of the far north, as instanced by Mr. Douglas. That is only one filth driving away another, and what a mess to make about the fair foliage of Smiling Beauty and Taylor's Glory! Besides, the meal of such plants interposes between the insect and the tissues he would feed upon, and so he mostly betakes himself in these cases to the under side of the leaf where there is less of this non-conductor—where the snow lies not so deep. It is then as little trouble to brush him off with a stiffish little brush, whose bristles generally bayonet him, as to drive him away with the smell of powder!—F. D. HORNER, *Kirkby Malzeard, Ripon*.

WHAT IS A BURR KNOT APPLE?

It has long been my intention to ask your readers to state their opinions on this subject, and I have just come across a few lines on it which I dotted down when living in South Wales, the very home of the Burr Knots, notwithstanding that some believe Yorkshire to have been the place of their origin, which at any rate must date from a very remote period, if not as far back as our native Crab. I have reason to think the Burr Knot older than any of the varieties of Apples at present growing in the United Kingdom. It is pretty generally distributed throughout, and in many parts of Wales forms almost the only Apple grown; I was almost going to say, can be grown, for in some parts so unfavourable are the soil and climate to most Apples, that it is almost the only one that can be grown with any amount of success. It forms the stock to work other varieties on. I do not refer to the better class of gardens where there are borders of the best turfy soil, but to the gardens of cottagers, farmers, and tradesmen, the only real guide. From my own experience in that part, no stock is equal to it for poor, cold, wet, heavy soils where there is a moist atmosphere. The Burr Knots are there known by the name of "Pitchers," why so I cannot say. There are the large, the small, and various other Pitchers, differing much in the colour, shape, size, and other characteristics of the fruit, which, however, is mostly small, the largest under the medium size of Apples generally. What are called Pitchers (Burr Knots) are simply any Apples that will form a tree by merely striking off a branch and placing it in the ground; in other words, all those trees which have an abundance of protuberances, which are masses of rootlets. These are ready at any favourable moment to form a vigorous growth of roots, and the branch becomes established even if it is large enough to have bloom-buds capable of perfecting fruit the same year; more, a branch may be planted in the autumn and grafted or budded the following spring or summer.

But here comes what I particularly wish for information on

Are we to conclude that all Apple trees are Burr Knots that have the characteristic protuberances? Why not at once call them the English Paradise? for no two trees can be more alike than it is to the French Paradise or Pommier de Paradis. I could scarcely believe otherwise than that they were identical when I saw the latter at Chiawick; the style of growth, and more particularly the abundance of large bloom-buds at the points of each shoot, were precisely of the character of one variety of the Welsh "Pitcher." It would be very interesting to learn from Mr. Barron if this stock produced fruit, and if so, its colour, shape, &c. In the variety I speak of the fruit is conical, below medium size, running small to the eye, which is small and depressed, the stalk also small, rather short, and deeply set in the base; colour when ripe yellow, and covered with red stripes; the tree a most prolific bearer as a rule, and always producing its fruit on the points of the young shoots, which are from 3 to 8 inches long. If all be true that is said of the French Paradise—viz., it is tender in our climate, it must differ considerably from the variety of Burr Knots in Wales, as nothing can be harder. There are many other varieties there that are of stronger and more rambling growth than the one in question, which is rather compact-growing, with not so many protuberances about the branches. The fruit are so different in all respects as to make one believe they are of quite distinct races. Some of them are very small, of a yellow colour, with veins of russet towards the stem, many of them having the appearance of having been cut and then haled over with a russet substance. Some varieties are compressed at each end, with a large Pippin-like eye, and stalks long and wire-like; others have a conical-shaped fruit similar to a Nonpareil. Most of these varieties are very long-keeping; some, I am inclined to think, seldom ripen. Many will stand on the trees far on in winter without apparent harm. All these make fine stocks. I have grafted such varieties as Cox's Orange Pippin, Golden Harvey, and others, which made a growth of 2 to 3 feet the second season. In the same soil, when worked on other stocks, they would not grow at all. I should have stated that these latter varieties produce their bloom-buds on short spurs, and not on the tips of the young shoots as with the former variety.

All the varieties I saw in South Wales were such as could be eaten or cooked, and quite different from those generally denominated Burr Knots, Sweet Burrs, &c. In the cider-making counties, as Hereford and Devon, they are a long pale lemon-coloured Apple, much the colour and shape of a Lord Suffield, and about the same size; ripe about the same season as that, but in flavour not so agreeable, for it is a regular cider Apple, which implies it must be a Bitter-sweet. These, too, have the peculiar protuberances, and will grow readily from branches, but are now seldom employed, as they rarely make trees so quickly as the Crab in dry sandy soils. Are we to class these with the others that are so different in all respects except the rooty squamose protuberance?

There is yet one other variety of Burr Knot I have not seen. It is, I understand, grown plentifully in parts of Hertfordshire, and at Ware Park goes by the name of Byde's Walking Stick, and is said to be a large handsome culinary Apple. Can anyone give me more particulars of this Burr Knot? If it is really a large Apple it must be a great improvement on all that I have seen. I have met with a few not-strictly-speaking Burr Knots that have a tendency to produce swollen masses, particularly so in certain situations, and would, no doubt, grow from branches if encouraged to do so, still distinct from the Burr Knot or English Paradise in not throwing out that mass of roots, or keeping the same so close to the surface. Branch-propagation is not, as some seem to think, only known of late years. I doubt not but it was practised by the rude Britons long before budding or grafting was thought of. But to get a large crop of fruit the first year must certainly be new. Whence comes the nutriment to feed this crop?—J. TAYLOR, *Hardwicke Grange*.

CYATHEA MEDULLARIS.

THE plant at Kew of *Cyathea medullaris*, the noblest of Tree Ferns, must be a fine one, doubtless to be the finest to be seen anywhere. When living at Tatton Park with Mr. Cliffe in 1870, we had then a plant nearly 20 feet in the trunk, with more than 12 feet of a frond. The house not being large enough, Lord Egerton determined to put up a larger one, which I believe to be 40 feet square and 35 feet high. This fine plant was to be replanted in the middle of the house already mentioned.

Leaving just at the time, I cannot say how this labour was performed. I have heard it was done, and that the plant succeeded well. I hope Mr. Cliffe will tell us through your columns the height and breadth of this fine plant at the present day.—A. STADDON, *Gorway Gardens, Teignmouth.*

THE CHRYSANTHEMUMS AND ORCHIDS

AT MESSRS. J. VEITCH & SONS, ROYAL EXOTIC NURSERY,
KING'S ROAD, CHELSEA.

THE display of Chrysanthemums at the Royal Exotic Nursery this year is much superior to that of last season, not only in the quantity, but much more so in the quality of the flowers. The large-flowered section is that principally represented, although all the best varieties of Japanese and Pompons are grown. Whatever section of horticulture or of floriculture is taken up by this firm, nothing is done by halves or in a half-hearted manner. Witness the Hyacinth, everybody's plant, and the prince of spring flowers. Now we have the king of autumn flowers, and one that is to be found in every garden. During the last sixteen years I have seen the best collections in England and Scotland, but nowhere have I seen so many really good flowers on the same number of plants as on this collection at Chelsea.

When Mr. Laing, now of Messrs. Downie, Laird, & Laing, had charge of the Earl of Rosslyn's Gardens at Dysart, he exhibited wonderfully large flowers in the Scottish metropolis, and such magnificent flowers of Golden Queen of England I have not seen since. But taking them upon the whole, though they were probably larger than the flowers grown in the south, the climate was against him, and the same finish was not apparent. Mr. Laing's system was to plant the cuttings early in December, and allow them to root slowly in cold frames during the winter, removing the plants to a position under a south wall when danger of injury from frost was not to be feared. It is still the best treatment to put in the cuttings early, and allow them to root without being forced in great heat; but from experience I believe it is not so important to put them in so early in the south, nor so safe, for the earliest cuttings have a tendency to flower during the early summer months, which spoils the autumn bloom. In the north I never saw the early-rooted plants flower prematurely.

There has also been very considerable improvement in the quality of the flowers raised during the last ten years, although for the last five or six nothing of sterling merit has been added to the large incurved or florists' section, except from sports. White Venua, a sport from the silvery lilac variety of that name, and George Glenny, a primrose-coloured sport from Mrs. George Rundle, will hold their own for many years to come.

Of course all the best varieties new and old are at Chelsea, and a few sterling sorts that are to be seen nowhere else. A very fine large incurved flower was pointed out to me as Annie Salter; now this variety I have not seen other than reflexed; whether it is a sport or whether the culture has to do with it, either way it is a better flower than Golden Beverley. A few of the very best are Empress of India, Gloria Mundi, Jardin des Plantes, John Salter, Lady Harding, Lady Slade, Mrs. George Rundle, Mrs. Haliburton, Pink Perfection, Prince Alfred, Prince of Wales, Princess Beatrice, Princess of Wales, Princess of Teck, and Venus. Amongst the Japanese a few of the best are Elaine, Fair Maid of Guernsey, Garnet, Jane Salter, James Salter, Magnum Bonum, Red Dragon, Grandiflorum, Apollo, Dr. Masters, Comet, and many more with quaint and beautiful flowers. Altogether this collection is well worth a visit of inspection, as the flowers are remarkably early this year, and will soon be over. The warm weather in the last week of October exactly suited the Chrysanthemum, and the early days of November have been equally favourable, so that out of doors where just a little attention has been given to tying and placing sticks to the plants the cottage gardens are a blaze of beauty.

Another remarkable feature at Messrs. Veitch's is the very large number of the different species of Orchids at present in flower. Some of them are distinguished for their extreme rarity and magnificent appearance. Of such is *Oncidium Rogersii*, which has a very large spike with twelve branches; its large golden-coloured labellum marks it as the finest of the species. *O. xanthinum* is an allied species, the flowers of the same deep yellow, but very much smaller; the spike is also smaller. *O. verrucosum* is very pretty, and the small-flowered delicately-scented *O. cheiroporum* is also in flower. Amongst

Cypripediums, *C. insigne* var. *Maulei* is remarkably handsome. There are also some very handsome *Cattleyas*. *C. exoniensis* is truly grand; all the varieties are worthy of culture in the most select collections, but some of those in flower here are of the most select character. One of the varieties of *C. labiata* had flowers of immense size, and reminded one of the best varieties of *C. Warnerii* in June. Numerous *Odontoglossums* are represented; *O. Roezlii* in many choice varieties, some of them with deep purple blotches at the base of the sepal; others have merely the usual pale yellow marking. *Maedevallia tovarensis* is now in full beauty. There are many fine specimens. One, very large, has a profusion of its pure white flowers in pairs. Their delicate transparent beauty remind one of the lilies—

"Hath swept the marble where her feet
Gleam'd whiter than the mountain sleet,
Ere from the cloud that gave it birth
It fell, and caught one stain of earth."

Of the Indian *Crocus Pleioneis*, the rather rare *P. Reichenbachiana* is in fine flower; also the Moth Orchids, *Calanthes* of sorts, *Sophranitia grandiflora* in large clumps; and the rare *Angraecum citratum* has a fine spike in an advanced state; indeed, it is seldom that one sees a larger number of species and varieties of Orchids in May.—J. DOUGLAS.

THE GARIBALDI STRAWBERRY.

As I supplemented Mr. Taylor's remarks on President, I may venture to tack on a tail to Mr. Wrather's note on Garibaldi. Mr. Friby, of Blankney Hall, forces Garibaldi largely; it is, in fact, his principal force, and right well it serves him with its heavy crops of well-coloured fruit. Noting its autumnal bearing, I may add that I have seen a border at Blankney in October, not with a ripe fruit dotted here and there as a curiosity, but from which quarts of ripe fruit were regularly gathered. This was from plants forced in the preceding spring. Many a Strawberry lover would have rejoiced over such a crop in July. This is unquestionably an early, free-bearing, and very useful variety of the Keens' Seedling type, but, unlike President, does not flourish so well on a light soil as on a sound generous loam. In a word, it is a good Strawberry with a good Strawberry soil to grow it in.

When in this garden I put the query, "Which is the best preserving Strawberry?" The reply was very prompt. "Grove End Scarlet of course," as if there could be any doubt or question about it. Certainly Mr. Friby had none, and the opinion of such a hard-headed practical man, confirmed as it is by that of many another of those who judge by sheer merit alone, has great weight. He plants Grove End Scarlet a foot apart in beds, gets quantities of fruit, and it produces a better and more beautifully-coloured jam than any other variety. That is the Blankney testimony, and "The Squire" likes everything good, from racers to Strawberries. He does not live in a cave if he keeps a "Hermit."—J. WRIGHT.

ROSES ON BRIAR STOCKS.

In reply to several private inquiries which I have received since I communicated an article to this Journal on the above subject, as to my peculiar method of rooting the Briar, I beg to say that what I select for my stocks are simply the young growths or offshoots of the common hedge Briar. They are not suckers with some roots attached as some of my correspondents suppose, but side shoots from the parent plant, which spring from all parts of the bush—from the centre stem or branches. These are pulled off wherever they occur, provided they are of the right thickness, just as you would take off a cutting or slip of any other plant. They are planted in the usual way, will throw out roots in abundance next summer, and will produce several offshoots or branches up the stock, which will be in nice order for budding about July or August next. Last October I put down about two hundred Briars in this way, and fully 80 per cent. were fit for working in. These I have all budded, and they are doing well. Last week I was transplanting some of these, and they were beautifully rooted, with an abundance of fine fibrous roots, which would have pleased Mr. Prince himself, and would not blush before his "Oxford seedlings." I was also raising some that were put down two years ago and once transplanted. These were quite as well rooted as some *Manettis* I was lifting at the same time, which is saying a good deal. I should say that Briars treated in this way throw up very few suckers, which is

a great consideration. The flowers are much larger and more robust than those on my Manetti stocks. This I have proved year after year.

When I commenced Rose-growing I had my Briar stocks dug-up by the roots, and planted after the old fashion. These, of course, had large, ugly, thick roots with very few fibres, and when budded, produced weak sickly heads, poor flowers, and lived only a few years. Every year some of these die, or are so poor and stunted that I dig them up in disgust, and throw them away. I could point them out from the rest as far as I could see them; but since I began my new plan not a single tree has died, nor are they showing any signs of decay; their vigour and health are refreshing to look at.

If anyone wishes to give this plan a trial stocks should be put down at once. I put mine down early in October, and sometimes in September; but they will do for a fortnight yet. If any brother amateur wishes for further information I shall be most happy at any time to communicate anything I know.—JOHN TURTLE, *Peacefield, Portadown.*

THE LINDLEY MEDAL.

It is gratifying to be able to announce that the Lindley Medal has at last been prepared. It is a handsome work of art, and its value is estimated at £15. On the obverse is a portrait of Dr. Lindley, enamelled with a laurel wreath, and the inscription, "Dr. John Lindley, F.R.S., born February 5th, 1799. Died November 1st, 1865;" on the reverse, Flora with a wreath in her left hand, and the inscription, "Royal Horticultural Society."

ROYAL HORTICULTURAL SOCIETY.

NOVEMBER 11TH.

This was the Chrysanthemum Show, and most worthily was that invaluable autumn flower represented in all its different sections; it was also a Fruit Show, and whether as regards outdoor or indoor productions, it must likewise be affirmed that it was a decided success. Of the latter we will merely say that they were of high excellence; but of the former the grand array of Apples and Pears was a sight which few who saw it will forget. No one probably anticipated such a success, and, unfortunately, those who were not present will not have the opportunity of gratifying themselves by an inspection, as it was only a one-day Show. It bodes well, however, for the future that the last Show of the season should be so well supported. On the exhibition of Chrysanthemums we shall give special notes next week.

Very few Pines were exhibited, thirteen in all; one Charlotte Rothschild, the remainder being Smooth-leaved Cayennes. The first prize for two Smooth-leaved Cayennes went to Mr. Jones, of the Royal Gardens, Frogmore, for two handsome fruit weighing about 8 lbs. each. Mr. W. Chamberlain, The Warren, Bushey Heath, Herts, was second; Mr. G. Sage, Ashridge Gardens, third. For Any other variety exclusive of Queens and Smooth-leaved Cayennes, Mr. G. Ward, gardener to F. N. Miller, Esq., was the only exhibitor, and took first prize with Charlotte Rothschild, weight 6½ lbs.

Of Grapes some excellent collections were exhibited, Messrs. H. Lane & Son securing the gold medal as usual with a collection of not more than ten varieties. Their Muscat of Alexandria and Bowood were really marvellous; Alicante with a fine bloom, and black as jet; Muscat Hamburg very fine; Gros Colman large in berry and beautifully coloured; Lady Downe's and Mrs. Pince both well coloured. Mr. Meredith, of The Vineyard, Garston, was second with good Alicante, Bowood, and Muscat of Alexandria, Lady Downe's, &c.

The only dish of Black Hamburgs came from Mr. G. A. Bromfield, gardener to G. F. Leith, Esq., Prittlewell, but no prize was awarded.

The best Alicante Grapes were sent from Mr. F. Deuxberry, gardener to Lord Darnley, Cobham Hall, Gravesend; second, Mr. C. E. Waters, gardener to A. Mongredien, Esq., Forest Hill. For any other black kind, omitting the above and Black Hamburg, Mr. W. Wildsmith, gardener to Viscount Eversley, Heckfield Place, Winchfield, was first with the most magnificent bunches of Lady Downe's ever seen; the three bunches weighed 8 lbs. 14 ozs. Mr. T. Bannerman, gardener to Lord Bagot, Blithfield, Rugeley, was second with well-finished Gros Guillaume. Mr. Meredith was third with Madresfield Court Black Muscat.

For Frontignan Grapes Messrs. Lane were first with three splendid bunches of Duchess of Buccleuch, beautifully coloured. Mr. J. Burnett, gardener to Mrs. Hope, The Deepdene, Dorking, second with nice bunches of the Grizzly.

In Muscat of Alexandria Messrs. Lane were again deservedly first with their splendid Grapes. Second Mr. W. Cole, gardener

to J. S. Budgett, Esq., Ealing Park. Third Mr. T. Wattam, Sheudist Gardens, Hemel Hempstead. For any other white kind Mr. Wattam was first with well-coloured Foster's Seedling. Mr. Meredith was second with Trebbiano.

The heaviest Black bunch was a splendid one of Gros Guillaume, beautifully coloured, the berries very fine, its weight was 6½ lbs. A very nice bunch of Gros Colman from Mr. Wildsmith, weighing 5 lbs. 12 ozs., was second. The heaviest White bunch was one of Trebbiano, weighing 4 lbs. from Mr. Meredith.

In the class for dessert Apples of twenty-four distinct varieties the first prize went to Mr. J. Pluck, of 33, New Street, Jersey, for splendid specimens of Blenheim Pippin highly coloured, Royal Pearmain, Court-pendu-Plat, and Lemon Pippin, with Reinette Gros Eil, Baldwin, Cooper's Pippin, Reinette Doré, Ribston Pippin, Golden Russet, Royal Pearmain, Cornish Gilliflower, one of the best though by no means one of the prettiest of Apples; White Lily, a beautiful waxlike Apple; Old Pearmain, Pigeon Noir, Red Calville finely coloured, King of the Pippins, Cockle Pippin, Reinette de Canterbury, Reinette Grise, Reinette du Canada, American Crab, Nonpareil, Golden Pippin, and Reinette de Caux. Second came another Jerseyman, Mr. G. Thomas, 22, Burnard Street, Jersey, who had very fine examples of King of Pippins, Royal Pearmain, Beauty of Kent, Cockle Pippin, Reinette de Caux, Court of Wick, with Cornish Gilliflower and others. Mr. J. Scott, Merriott Nurseries, Crewkerne; Mr. F. Rutland, gardener to the Duke of Richmond, Goodwood; Mr. R. Webb, Culham House, Calcot; Mr. G. Gardiner, gardener to E. P. Shirley, Esq., Stratford-on-Avon; Mr. S. Ford, Leonardslee, Horsham; Messrs. Lane, St. Mary's Cray; and Mr. Pragnell also exhibited fine specimens, among which, besides varieties already named, were excellent specimens of Brabant Bellefleur, Adams' Pearmain, Manchester Pippin, Court of Wick, Scarlet Pearmain, Sturmer Pippin, a very useful Apple, Golden Winter Pearmain, generally called King of the Pippins, Golden Reinette, Fearn's Pippin, and Spanish Pippin, a handsome-looking Apple.

For six varieties Mr. C. Ross, gardener to C. Eyre, Esq., Newbury, took the first place with Blenheim Pippin, Cox's Orange Pippin, Scarlet Nonpareil, and Golden Reinette, very fine, Cornish Aromatic, and Margil. Mr. Pluck, Jersey, was second with splendid Blenheim Pippin, Reinette Gros Eil, Reinette Doré, Court-pendu-Plat beautifully coloured, Golden Russet, and Reinette du Canada. Third came Messrs. Lane, St. Mary's Cray, with a fine half dozen, and several other excellent collections were shown.

For three kinds the prizes went—first to Mr. Bannister, gardener to H. H. Ames, Esq., Cote House, Westbury-on-Trym, for Ribston Pippin, King of the Pippins, and Blenheim Pippin, not large, but beautifully clean and well coloured. Second came Mr. C. Ross with Cornish Aromatic splendidly coloured, Blenheim Pippin, and Cox's Orange Pippin. Third Mr. G. T. Miles with Blenheim Pippin, very fine; King of the Pippins, large and finely coloured; and Ribston Pippin.

The next class was for that excellent and beautiful dessert Apple, Cox's Orange Pippin. Here the competition was keen, the dishes shown being almost without exception meritorious. First came Mr. T. Miller, gardener to J. T. Friend, Esq., Margate, with large deeply coloured specimens; second Mr. C. Ross, and third Mr. W. Gardiner, gardener to E. P. Shirley, Esq.

Of Golden Pippin the first-prize dish came from Mr. Brush, gardener to Lady Hume Campbell, Pinner; the second from Mr. Rutland, and the third from Mr. Bannister. For Margil the awards went to Mr. Fraser, Bromley, Mr. G. T. Miles, and Mr. Bromfield, gardener to J. F. Little, Esq., Prittlewell. For Cockle Pippin Mr. Rutland, gardener to the Duke of Richmond, was first with fine specimens, Mr. R. Webb being an excellent second, and Mr. J. Smith, Romford, third. Ribston Pippin was freely represented, though the fruit was not generally of large size. The first prize was awarded to Mr. H. Bannister, gardener to H. H. Ames, Esq., Westbury-on-Trym; the second to Mr. Rutland for handsome finely coloured fruit; the third to Mr. R. Dean, Ealing. For Court-pendu-Plat Mr. R. Webb, of Culham House, Calcot, was first with large and remarkably fine specimens; Mr. Pluck being second, and Mr. Rutland third.

In the class for any other dessert kind the first place was taken by Messrs. Lane, St. Mary's Cray, for magnificent specimens of Blenheim Pippin. Mr. C. Haycock, gardener to R. Leigh, Esq., Burnham Court, Maidstone, was second with splendid King of the Pippins; and Mr. Bennett, gardener to W. Burrell, Esq., Ockendon House, third with Scarlet Nonpareil.

Of Kitchen Apples there was a grand display. First for eighteen varieties came Mr. F. Rutland, Goodwood, with splendid specimens of Gloria Mundi, Blenheim Pippin, Lincolnshire Reinette, Royal Russet, Beauty of Herts, Dumelow's Seedling finely coloured, Flower of Kent, Norfolk Beefing, Shepherd's Seedling, and Nelson's Glory. Mr. W. Gardiner, Lower Ealington Park, was second, also with very fine specimens of Blenheim and Flanders Pippin, Royal Russet, Northern Greening, Alfriston, Costard, and Ettington Seedling. Third came Mr.

Garland, Killerton. Several other highly meritorious collections were exhibited in this class.

For six varieties the first place was taken by Mr. C. Ross with splendid examples of Blenheim Pippin, Lewis's Incomparable, Northern Greening, Dumelow's Seedling, Striped Beefing, and Kentish Filbasket. Second, Mr. Brush, Pinner; third, Mr. A. Parsons, Fairlawn, Turnham Green. For Dumelow's Seedling, first came Mr. E. Freeman, Chilton, Thame; second, Mr. G. Bush, High Grove, Pinner; third, Mr. W. Holder, Springfield, Reading. For Alfriston, Mr. Ross, gardener to C. Eyre, Esq., Welford Park, Newbury, was first with remarkably fine specimens; almost equally good were the second from Mr. Pluck; whilst Mr. Thomas, also of Jersey, was third. Of Emperor Alexander fine specimens from Mr. Ford were first; Mr. W. Pratt, Little Gaddesden, being second; and Mr. Thomas third with comparatively small but highly-coloured fruit. The best dish of Mère de Ménage came from Mr. T. Bray, gardener to Mrs. A. Leybourne, Popham, Littlecote; Mr. Wildsmith, Heckfield, being second; and Mr. J. Walker, Thame, third. For Reimette du Canada Mr. C. Haycock was first with very large fruit; second, Mr. Fraser, Bromley; and third, Mr. Gardiner, Stratford-on-Avon. Mr. Pluck, 38, New Street, Jersey, exhibited a dish in which one of the fruit had evidently been plucked. In the interest of the exhibitor we would urge that the public should be informed of the way in which this came about. For the best dish of any other kitchen Apple Mr. Bannister was first, Mr. Walker second, with Blenheim, and Mr. F. Miller third, the last with Beauty of Kent. For the heaviest dish of six Mr. C. Haycock, gardener to R. Leigh, Esq., was first with Belle Dubois, 5½ lbs.; Mr. Bailey, Cecil House, Wimbledon, second with Reimette du Canada, 5 lbs. 11 ozs.; and Mr. E. Smith third with Lord Suffield.

In Class 48, Dessert Pears, eighteen varieties, six fruits of each, there was a most excellent show. The first prize was awarded to Mr. F. Langlois, Ronge Bouillon, St. Helier's, Jersey; the specimens were extraordinary for size and colour. Second Mr. Pluck, 38, New Street, Jersey, who ran the former exhibitor very closely. In Class 49, six dishes, six fruits of each, the first prize fell to Mr. Thomas, 22, Burrard Street, Jersey; the second to Mr. G. Miles, gardener to Lord Carington, Wycombe Abbey, Bucks, for a clean finely-coloured lot. In three varieties, six fruits of each, eighty dishes were shown. Mr. Thomas, of Jersey, was again first with some extraordinary specimens. The second prize fell to Mr. Pluck, 38, New Street, Jersey; the third to Mr. J. Tivey, gardener to P. Gossett, Esq., Bagot, St. Saviour's, Jersey.

For six fruits of Marie Louise the prizes went to Mr. Clark, gardener to the Rev. A. Stackpoole, whose fruit was very fine; the other awards to Mr. Stephenson and Mr. Wildsmith. Of Glon Morcean some remarkable specimens were shown, especially those by Mr. G. Thomas, of Jersey; and Mr. Parsons for large, well-coloured fruit; and third Mr. W. Cole, gardener to W. K. Wigram, Esq., Twickenham. The last-named exhibitor was also first for Duchesse d'Angoulême with splendid specimens, Mr. Pluck being second, and Mr. Sage, Ashridge, third, and a very good third. Doyenné du Comice was represented by splendid fruit from Mr. Thomas, Mr. Pluck and Mr. Garland, Killerton, having it also very good. Of Doyenné Boussoch, the best dish came from Mr. Thomas, Mr. Herrington, gardener to J. Price, Esq., Clapham Road, being second. For Van Mons Léon Leclerc, Mr. O. Goldsmith, gardener to Sir W. Farguher, Bart., stood first, and Mr. Pluck second. Chamoncel weighing 9 lbs. the dish, exhibited by Mr. Thomas, came first in the class for any other dessert kind.

Of Catillac, very large fruit from Mr. Pluck took the first place; Mr. Tivey, also of Jersey, being second with six weighing 12½ lbs.; whilst Mr. Ross was third with a half-dozen weighing 8 lbs. 9 ozs., the heaviest of which was 1 lb. 11 ozs. For Uvedale's St. Germain the awards went to Mr. Scott, Merriott, Mr. Pluck, and Mr. Thomas, for dishes weighing from 13 lbs. 5 ozs. to 14 lbs. 3 ozs. But these weights were far surpassed in the class for the six heaviest Pears of any variety, the Rev. T. C. Bréhat showing half a dozen of Uvedale's St. Germain weighing 19 lbs. 13½ ozs., Mr. Thomas a dish of 14 lbs. 13 ozs.; whilst Mr. Langlois, who was second, had a dish still heavier.

Three sticks of White Celery. First came Mr. C. Osman, South Metropolitan Schools, Sutton, Surrey, with Sandringham White. Second Mr. W. Pragnell, gardener to G. D. Digby, Esq., Sherborne Castle, Dorset; this is some mistake, as the second-prize lot ought to have been placed first. Third for white Mr. G. Woodman, gardener to W. Gillon, Esq., Lillystone Hall, Ingatstone, Essex. For three heads of Red Celery. First Mr. Woodman, with the Leicester Red, very good. Second Mr. Lidgard, Albion Road, Hammersmith, with Manchester Red. Third Mr. Parsons, Danesbury Park, Welwyn, Leicester Red.

Class 65. Collection of eighteen sorts of vegetables, for prizes offered by Messrs. Carter & Co.; three competitors. First Mr. W. Pragnell, with a very good, well-grown collection, including James's Intermediate Carrot, fine Snowball Turnips, Maltese Parsnips, Giant Rocca Onions, Model Potatoes, Carter's Dwarf

Mammoth Cauliflowers, fine Drumhead Savoy, Sandringham Celery, &c. Second Mr. C. Osman, with a very meritorious collection. Third Mr. D. Lumaden, Bloxham Hall, Sleaford, with, among other things, some well-grown Cardoons, Telegraph Cucumbers, and Lettuces.

Class 66, for ten dishes of Potatoes, also offered by Messrs. Carter & Co. First Mr. D. Lumaden with good samples of Early Vermont, Ashtop Pluke, Carter's Main Crop, Red-skin Flourball, and others. Second Mr. Miller, gardener to J. F. Friend, Esq., Margate, with many similar varieties. Third Mr. Osman, his sorts being rather small. Messrs. Carter also showed a collection of sixty-five sorts of Potatoes, not for competition, which made a grand show.

From the Society's gardens, Chiswick, came an equally meritorious collection, but much larger in number, being 110 varieties of all those grown at Chiswick. The Society also contributed a good collection of both red and white Celery, consisting of twenty-four varieties of white and the same number of the red kinds.

FRUIT COMMITTEE.—Alfred Smee, Esq., F.R.S., in the chair. Messrs. James Carter & Co. sent Fern-leaved Parsley, a variety with very finely-cut leaflets, differing from curled Parsley in this respect, that while the latter has the leaflets very much curled, the former are not curled but finely divided. They also exhibited a large collection of Cabbages and Beets, to which cultural commendations were respectively awarded. Messrs. Veitch & Sons exhibited a fine collection of Celery admirably grown, to which a cultural commendation was awarded.

Mr. Gilbert, of Burghley, sent fruit of a scarlet-fruited Egg Plant, which from its colour appears to be very ornamental. They are of the size of a medium-sized Tomato. Mr. P. Bennett, gardener to W. W. Burrell, Esq., Ockenden House, Cuckfield, sent roots of the White China Radish, of cylindrical shape, 4 to 6 inches long and 3 in diameter. Messrs. Cutbush & Son, Highgate, sent a new Onion called Oscar, also Bedfordshire Champion, White Globe, and Nuneham Park. They were all excellent examples and fine bulbs. Oscar was much admired as a fine Onion, and the Committee requested that it be shown at the December meeting with White Intermediate. Mr. Cramb, of Tortworth Gardens, sent a Savoy called King Coffee, a small compact dwarf Savoy. Mr. H. Smythe, Dyke Road, Brighton, sent a white Celery called Princess Royal, which proved to be the same as Incomparable White.

Mr. William Earley, of Valentines, exhibited branches of Earley's November Plum, which is in reality a large Bullace, and bearing abundantly like the Bullace. Mr. John Webster, Gordon Castle Gardens, N.B., sent a seedling Plum similar to Washington, but very late. It is called November Gage, and was raised from Reine Claude de Bavay. He also sent Aurora, a purple Plum raised from Ickworth Impératrice. It is a clingstone, and the fruit were shrivelled and rather sweet. Mr. Pearson, of Chilwell, exhibited fine bunches of his Golden Queen Grape, which received a first-class certificate last year. It was deliciously flavoured. He also exhibited Chilwell Alicante, a large-bunched black Grape with a long oval berry like Morocco, and also another seedling from the same origin as Golden Queen called Mrs. Pearson. The berries are not so long as Golden Queen. They are of a fine golden colour, and rich in flavour. It was awarded a first-class certificate.

Mr. Bradley, of Elton Manor, near Bingham, sent a seedling Pear, which is so like Comte de Lamy that the Committee passed it. Mr. Coles, The Chestnuts, Twickenham, sent a fine dish of Knight's Monarch. Mr. Robert Donne, Odcombe, Ilminster, sent a seedling Pear, very much like Bezi Vaet. It has the fault of rotting at the core before it ripens on the surface. The same gentleman sent a seedling Apple raised between Ribston Pippin and Nonpareil, a good Apple but not superior to either of the parents. Mr. James McDonald, nurseryman, Chichester, sent a large Pear called Gloria Mundi. The fruit is of enormous size, 5½ inches long, and the same in width, turbinate. It was referred to the January meeting, till it would be ripe; we believe it to be a fine specimen of Catillac. Henry Webb, Esq., Redstone Manor, Redhill, sent a dish of Prince Albert Pear, the flavour of which was very fine. Mr. J. A. Wright, Stone Grove Nursery, Edgware, sent a dish of a large seedling kitchen Apple, called Mrs. Woodbridge. It was ordered to be cooked and a report to be made at the next meeting. He also sent another seedling called Harrow Pippin, a pretty Apple of good flavour. Mr. Gilbert, of Burghley Gardens, sent a very showy Apple called Beauty of Barnack. It is finely striped like Beauty of Kent. It has a tender flesh, is brisk in flavour, and a good cooking Apple. Mr. William Gardiner, of Lower Easington Park, Stratford-on-Avon, sent a large seedling Apple, with tender flesh and mild flavour. Mr. Thomas Baines, Southgate, sent a dish of Proctor's Seedling, a culinary Apple, grown in the north of England, which he stated is a fair dessert Apple in February. They were ordered to be kept till they are ripe. Mr. Haycock, Barham Court, Maidstone, sent a dish of fine specimens of Calville Blanche, which received a first-class cer-

tificate. Mr. Fenn, The Rectory, Woodstock, sent specimens of Blenheim Pippin, Cox's Orange Pippin, and Ribston Pippin.

FLORAL COMMITTEE.—Mr. J. Fraser in the chair. On this occasion few subjects were shown. First-class certificates were awarded to Mr. Williams, of Holloway, for *Anthurium Williamsii*, which has been before described; to Messrs. Veitch for Japanese *Chrysanthemums* Golden Thread, orange brown, Cosack, and Duchess of Edinburgh. A cultural commendation was awarded to Mr. W. Smith, gardener to C. Lane, Esq., Henley, for a fine specimen of *Vanda cærulea* with five fine apikea.

PELARGONIUM SOCIETY.

A MEETING of the Pelargonium Society was held at South Kensington yesterday, Henry Webb, Esq., in the chair. The following additional prizes were offered:—Six Ornamental Cape Pelargoniums, distinct, £3, £2. For the best hybrid Pelargonium of distinct character, £2, £1. Stand of twenty-four cut blooms, single trusses (open), £2, £1; stand of twelve (amateurs), £2, £1. The Judges may in their discretion, subject to the approval of the Committee, award a prize or prizes to any exhibits which may not be provided for in the schedule, and worthy of particular notice.

PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

TACCA ARTOCARPIFOLIA. *Nat. ord., Taccaceæ. Linn., Hexandria Monogynia.*—Flowers brown and green. "It is a native of Madagascar and Johanna Islands, whence there are excellent specimens in the Hookerian Herbarium, from Mr. Justice Blackburn, Dr. Lyall, and W. T. Gerrard. Its nearest ally is the well-known *T. pinnatifida*, which, though one of the most widely cultivated and most useful plants in the Pacific Islands, has never yet been figured in any English botanical work; nor, as far as we know, ever been introduced into this country. The tubers of *T. pinnatifida* afford the South Sea arrowroot, said to be the best of all in cases of dysentery, and its starch is a favorite article of diet in the shape of puddings and cakes.

"The *T. artocarpifolia* has a tuberous root, and is, no doubt, as full of starch and as wholesome as *T. pinnatifida*. It flowered in the Royal Gardens in May of the present year, from roots received from Mr. Wilson Saunders in 1872."—(*Bot. Mag.*, t. 6124.)

POGONIA DISCOLOR. *Nat. ord., Orchidaceæ. Linn., Gynandria Monandria.*—Flowers white; leaves dark green, with pale blue-green blotches. "The species of *Pogonia* have usually little to recommend them for horticultural purposes; but to this there are exceptions, especially amongst the Indian species, some of which that have been cultivated at Kew present, like that here figured, beautifully coloured and marked leaves that persist for many weeks, and attract the attention of the most ordinary observer. All have tuberous roots, often formed at the end of subterranean cylindric fibres. It is not easy so to manage their culture as that the leaves, flowers, and new tubers should be successfully formed, and upon this their continuance under cultivation depends. The present is closely allied to the common *P. plicata* of Bengal, which has a rose-coloured lip.

"*Pogonia discolor* is a native of damp forests in the mountain region of Western Java, where it flowers in November. The specimen here figured was flowered by Mr. Bullin in February last, and the leaf was fully formed in the following June."—(*Ibid.*, t. 6125.)

LILIU MACULATUM. *Nat. ord., Liliaceæ. Linn., Hexandria Monogynia.*—Flowers orange, with dark brown spots. "A native of Kamtschatka, the Kurile and Sachalin Islands, Japan, and South-eastern Manchuria, whence it was introduced into the Russian Imperial Botanical Gardens, and we have dried specimens from Sitka on the American coast.

"According to Maximovicz (in "*Gartenflora*"), there are two varieties of it: one, with a scented orange-yellow flower, which came from Victoria Sound; the other, with red inodorous flowers, is found in Japan and Kamtschatka, is figured by Regel in the "*Gartenflora*." The leaves of both varieties vary extremely, both as to the number of whorls, the number in each whorl, and in length and breadth.

"I am indebted to Mr. G. F. Wilson, F.R.S., of Weybridge Heath, for the specimen figured, the bulb of which he purchased at a sale of Japan Lilies in London, and which flowered in June of the present year. I have also seen a specimen flowered by Mr. W. Saunders, F.R.S., in 1871."—(*Ibid.*, t. 6126.)

SCORZONERA UNULATA. *Nat. ord., Compositæ. Linn., Syngenesia æqualis.*—Flowers pink. "Brought by Mr. Maw from Algeria, where he recognised it as apparently the same with a plant we found between Tangiera and Tetuan in Morocco. It flowered in July, and had a very handsome appearance."—(*Ibid.*, t. 6127.)

CITRUS AURANTIUM VAR. JAPONICA. *Nat. ord., Rutaceæ. Linn., Polyadelphia Polyandria.*—"This well-known ingredient in Chinese sweetmeats, according to Siebold, is nowhere found wild in Japan; this author says that, in common with all other species and varieties of *Citrus*, it has been introduced into the island from China or India; also that it is extensively cultivated under two varieties, one with globose, the other with oval fruit, which latter is rare. He adds, that the agreeable acid of the juice, flavoured by the aroma of the rind, renders the fruit very pleasant, but that it yields only a transient refreshment, for it leaves a burning after-taste in the mouth."—(*Ibid.*, t. 6128.)

SOME OF THE VEGETABLE PRODUCTS OF CEYLON.—No. 1.

HAVING dealt with the principal products of Ceylon—viz., Cinnamon, the Cocoa-nut, and Coffee, in the pages of the "*Food Journal*," it is my intention in the present paper to allude to those other productions which do not as yet figure among the exports of the colony, save in some instances to a very limited extent.

Coffee is the great staple of the colony, and Ceylon, I fancy, exports more Coffee than the whole of the West Indian colonies; but, as it has been well remarked, seldom can any good reason be offered why land in any country should be exclusively devoted to the raising of one particular description of produce. A long experience has shown that the contrary practice is beneficial to the temperate regions of Europe; and although by reason of the greater energy of vegetation within the tropics the system so indispensable in Europe may there to a certain extent be disregarded, this offers no argument against the adoption of that system, since by it means a still greater power of production may be called into action.

TEA.—In 1867 Mr. Arthur Morice, a Coffee proprietor in Ceylon, and a gentleman every way competent for the task, was entrusted by the Government of Ceylon, at the instance of the Planters' Association of that colony, to report on the Tea districts of Continental India, with the ultimate view of ascertaining whether Tea could be successfully grown in Ceylon if fairly tried with the best system of manipulation.

There had been some previous experiments in Tea cultivation at Newera Ellia by a former Governor of Ceylon, Mr. Stewart Mackenzie, and at Pussilawa, both situated within the mountain zone of the central province. Both were on a small scale. The first was not successful; in the latter case the plants were healthy, but no commercial success was achieved, the gentleman who owned the land on which the plants were growing carrying out the experiment as an amusement, his attention being absorbed in the cultivation of Coffee on a very extensive scale.

Mr. Morice visited the Tea districts of Assam, Deyra Dhoow, Kengra, Coorg, and the Neilgherries, and submitted on his return to Ceylon a very exhaustive report to the Local Government. Mr. Morice was of opinion that every probability existed of Tea being successfully grown in Ceylon if only fairly tried with the best plants and with the best system of manipulation. He remarked that in Assam and in the Himalayas, where there is a constant struggle with grass going on, at least one coolie per acre during crop season was considered necessary; and from the system of imported labour in Assam the full complement has to be kept on all the year round; and, indeed, to do full justice during the plucking season not only to that work but to the weeding, one man and a half per acre would probably in most cases be necessary. In Ceylon, with a plantation free of weeds and in full bearing, it is probable during crop one man per acre, including every one, might be the utmost required; and out of crop a very small force of women and children would do all the weeding and pruning necessary. Tea in Ceylon would have the advantage of being in crop when the majority of Coffee estates were not, and *vice versa*, and thus labour might be made available for both cultivations without their interfering with each other. The seasons, therefore, as the respective crops came in, would be at no time in collision; on the contrary, an advantage of no mean importance would be derived in dealing with imported labour, from

having facilities afforded for finding employment for surplus labour without losing it altogether during the intervals between the crops of both cultivations.

If Malabar labour be not forthcoming, Chinese can, doubtless, be obtained if a careful system of emigration be carried out, and emigrants be introduced from the pure agricultural districts of China, and not drawn from the lowest strata of the cities of that empire.

In the "Food Journal" of November, 1872, it is stated that Tea has been already produced in Ceylon of so excellent a quality as to be pronounced worth 3s. per pound on the spot.

The present Governor of Ceylon (The Right Hon. W. H. Gregory), in his speech to the Legislative Council, quoted in the "Food Journal" of December, 1872, takes, it would appear, a very favourable view of the prospects of Ceylon as a Tea-producing country. The right hon. gentleman with truth considers that it will be an important adjunct to Coffee, as it will enable the planter to find continuous work for his labourers (the great desideratum), and will bring into cultivation large tracts of land which are generally considered to be too high for Coffee. In a few years we may reasonably count upon an export of some quantity of good Tea from Ceylon, and which, probably, like the Tea from Continental India, will reach the consumer comparatively pure and unadulterated. It is well known that much of the Chinese Tea is largely adulterated before it leaves China, passing, as it does, through so many native hands prior to its shipment for Europe.

When in Ceylon I understood that in 1778, when the Dutch possessed the maritime portion of the island, a Tea plant was discovered in the Margam Patoe of the southern province. Its leaves were ordered to be dried and duly prepared by Mr. Angelbeck, the then (Dutch) Collector of the province, and sold under the name of Badegiri Tea on account of the Dutch Government, at the rate of 6s. the pound. A note is now before me from General Walker, no mean botanist, who was for some years in Ceylon (he died in India in command of a division there), forwarding to me some leaves of the said Tea; but a plant can no more be known by its mere leaves than a man by his coat. As, however, its cultivation was not extended, it is to be presumed that the after-importation of Tea from China, at a comparatively low rate as to cost, operated prejudicially to any attempt to grow it as an article of local consumption or of export.

In the report of the Director (Dr. Thwaites) of the Royal Botanic Gardens in Ceylon for the current year, it is stated that the cultivation of the Assam hybrid variety of Tea is getting rapidly into favour, and but for the comparatively small number of plants and seeds procurable in the island, added to the difficulty of obtaining from India really good seeds for germinating, Tea cultivation would advance more expeditiously here. There cannot be the least doubt, however, that these difficulties will not long operate as a check, the climate of the island being so admirably adapted for Tea-growing. The Assam hybrid variety grows equally well at Pèradeniya and at Hakgala, and the plantations in both places are being considerably added to, in order that we may be prepared by-and-by to issue fresh seeds in large quantity. Of the ordinary Bohea Tea of China good supplies at a very moderate charge are obtainable from both gardens. Dr. Thwaites strongly recommends trials being made of this hardy plant on abandoned Coffee estates rather than that weeds should be allowed to take possession of the land. There can hardly be a doubt that the expense of such a step would be more than repaid if Tea is one day to become, as it most probably will, one of the most important staple products of the island.

RICE.—The cultivation is gradually extending under the judicious system introduced by the Island Government, and energetically carried out by its local agents, in reference to the repair of some of the ancient tanks and the construction of new irrigation works, and in the eastern province, especially, the results have been in the highest degree satisfactory, and there is reason to hope that the large sum hitherto annually paid by Ceylon to Continental India for grain supplies will ere long be very considerably reduced and finally extinguished, and the next phase in the career of Ceylon may find her an exporter of grain. By the restoration of ancient tanks, and by additional reservoirs for storing water being constructed, which the modern appliances of science render of comparatively easy formation, such a result may be arrived at, at no very remote period.

The supply of water would also be invaluable to the health

of both the inhabitants and their cattle. At present it is notorious that in those districts of Ceylon where the old tanks are situated, and where additional dams, &c., are required, the water is very unwholesome, and most inimical to the health of both man and beast. In works of irrigation the executive have the native with them most thoroughly, and that is half the battle, especially in a tropical country. He knows full well the inestimable advantage of having a command of that element in reference to his agricultural operations. All that is wanted is the loan of capital and European overlooking to insure success, and Government, as is the case at present, is far more than recouping itself by the enhanced value of the raw material (the land) and the taxation on its produce, while a lively sense of favours conferred is felt by the governed, and contentment under English rule is materially strengthened.

In the report of the Irrigation Committee of the Legislative Council it is stated that the Blue-book returns show that the annual production of Paddy (unhusked Rice) is about seven millions of bushels. The average yield is as nearly as possible sevenfold, and that according to ancient inscriptions at Poloneura (one of the ancient cities of Ceylon, and situated in a now most deserted part of the island), the yield of Rice land in Ceylon in the twelfth century was seventeen and a half-fold. The difference between the present and former yield is therefore ten and a half millions of bushels, equal to five millions of bushels of Rice, or one million bushels more than the yearly import of that grain. The question naturally arises whether by means of irrigation, supplemented by better seed and improved processes, the former yield of the soil may be to a great extent recovered, and thus enable Ceylon to reduce her dependance on foreign supplies to a minimum. The yield in Madras and Bengal is twenty to thirtyfold, in Burmah forty to fiftyfold, and in the latter case entirely without manure. The Committee were further of opinion that great as would be the benefit conferred on agriculture by an improved system of irrigation, a part only of its good results would be experienced unless a change of seed be resorted to and maintained. The rotation of seed could be easily carried out, and its effects would be so manifest, and in such a short time, that there should be no difficulty in inducing its adoption by the natives.

The Committee do not share in the opinion held by many persons, that the natives of Ceylon, in common with other orientals, are opposed to change in their agricultural operations, and that it would be in vain to endeavour to introduce amongst them any improvements in the cultivation of Rice. Judging from what has been done in the cultivation of other Ceylon produce, as well as from what has taken place among the ryots of Continental India, this opinion appears to be erroneous. In a paper on the food resources of Ceylon, published in the "Food Journal" of June 1871, I alluded to a legislative enactment which I had the privilege, as a Government Member of the Legislative Council, to assist in framing, and having for its aim the renewal and enforcement of the ancient customs regulating the irrigation and cultivation of Rice lands. The machinery of this law has been since extended and otherwise improved in those particulars which, in its practical working, were shown to be required, and has thereby given a great and steady impetus to the cultivation of Rice.—E. RAWDON POWER, *Ceylon Civil Service (Retired), Tenby, South Wales.*

NOVELTIES IN THE ROYAL GARDENS, KEW.

BROWNEA COCCINEA is flowering in house No. 1, and, it is needless to say, is very ornamental. It should be seen from beneath, as the fascicles of flowers hang down. Young plants do not flower freely, and thus we account for its not being more generally grown as a stove plant. Old plants when fully in bloom are very handsome, and are well worth the necessary amount of space. The soil should consist of loam and peat, with a moderate amount of river sand; the first may predominate if free and open. When growing a free supply of moisture to the air is beneficial. Seeds are very often dead when received from abroad in the ordinary way, but if packed in moss or soil very slightly damp they are sure to arrive in good condition. Cuttings are rooted with little difficulty, selecting small shoots not quite ripe. It is a native of Venezuela. This is the freest-blooming of the genus. *B. grandiceps*

* Ingredients in 1 lb. of Rice:—Water, 2½ ozs.; gluten, 1 oz.; starch, 11.8-10 ozs.; sugar, 1-16 oz.; gum, 1-5 oz.; fat or oil, ½ oz.; woody fibre ½ oz.; ashes, 1-16 oz. Carbon in 1 lb. of the above substances, 6 ozs.

is worth cultivation for the great beauty of its leaves when young; they are light green, beautifully mottled with brown, and droop gracefully: these characteristics are retained for a considerable time. It is rather a vigorous grower, but will submit to cutting back, though it should not be done oftener than is necessary, as the stronger the growth the finer the young leaves. This is a native of the Caraccas. *Brownea* is closely allied to *Amherstia*, of which in this house there is a flourishing specimen.

Dahlia imperialis is flowering finely among the Cycads in the Palm house, and is apparently better with the warmth here afforded than with greenhouse temperature. It is a magnificent ornament for large structures where it can be seen to advantage, though it should be remembered that by grafting on liliputian kinds a dwarfed result has been obtained, with the addition of a finer pyramidal habit, in which condition it is more valuable. This we remark, as from its great size it appears to be one of those things that, having created a sensation, may become neglected, and in time be lost to cultivation. It is possible that the liliputian kinds only, used as stocks, will produce the desired result. In one instance observed in the Royal Gardens a strong-growing yellow-flowering kind was used, and no effect on the growth of the scion could be detected. During summer these plants may be plunged out of doors in a moderately shaded place, be potted in rich porous soil, without being allowed to suffer for want of pot room, and have a free supply of water.

PELARGONIUMS AND GERANIUMS.

I CANNOT help thinking that one of the effects of the new Pelargonium Society will be to convince us that Pelargonium and Geranium are not distinct species [genera]. I take it that if a plant raised between two supposed distinct species prove infertile it may be considered a mule, and goes to prove its parents are distinct, whilst if it prove fertile it proves the contrary. For several years E. J. Lowe, Esq., of Highfield, Nottingham, has been trying to raise a blue Geranium by crossing the *Geranium sanguineum* with Madame Vaucher zonal Pelargonium. Many of these seedlings have produced red, rose, and white flowers, some with curious foliage, but few would believe they were really the result of the cross attempted. The only thing which made me doubt was I could not imagine, if they were not so raised, how such queer things could be produced from Madame Vaucher. He has just sent me two plants in flower much alike in every respect, and I think no one who sees them can doubt that they are really raised between the hedge Geranium and a zonal. The foliage, the way the flower stalks grow, and particularly the colour and veining of the petals, convince me at any rate that such is the case. Having often laughed with and at Mr. Lowe over these green seedlings of his, I hasten to humbly "eat the Leek," and declare myself a convert. If I live I will bring one of them to the Society's first show if in flower, and then it can be examined by the savans, and we shall hear what they say about it.

For the information of the curious I may say the flowers are blue pink (some see blue in them), and that the shape of the flowers are the exact opposite of what a florist would consider perfection, the petals being long and narrow, reminding one as much of the shape of a *Pancreatum* as of a round zonal Geranium. Though the plant will be despised by the florist, it will be admired by the lovers of curious things, for when well flowered it is really pretty as well as curious. Mr. Lowe thinks it a mule; I do not much doubt being able to seed it. Time will show which is right.—J. R. PEARSON, *Chilwell*.

MILDEWED ROSES.

For the last two years my Roses have suffered much from mildew, some more than others, but all of them—those under glass, those massed in a quarter-acre bed, those sprinkled over the garden. The soil is a light loam with a bed of marl from 2 to 3 feet below the surface, well drained four years ago.

The Roses have been well mulched from the stable and pigsties, top-dressed for the winter and again for the second bloom, with occasional real waterings with a little guano when the weather has been dry. The strange thing is, that in spite of it all the bloom has not been amiss, though I literally cannot find clean foliage to go with it. I think sulphur freely used checked it slightly.

I purpose this winter clearing the ground, digging, in hopes of burying the germs, and then replanting, having pruned

and painted thoroughly every stock with boiled sulphur and lime.—R. T. F.

[The foregoing was sent to our correspondent, the Rev. C. P. Peach, and accidentally mislaid with other papers. He says—As the question is of importance I should like to ask the advice of other Rose-growers. Not knowing the exact position of the Rosea it is difficult to give positive advice. Mildew is often caused by a want of circulation of air, and too much mulching and top-dressing will often bring the roots to the surface, and they then suffer from changes from moist to dry. A light loam requires manure deep at the roots. I do not think the germs of mildew exist in the soil; like all minute fungus spores, they are floating about in the air ready to germinate when they find a congenial bed, and any sudden check given to foliage in a growing state will often give a proper nidus for the germs.]

THE RASPBERRY.

THIS past been an unfavourable season for the Raspberry. The crop generally has been very limited; a better show of blossom could not have been wished, and the fruit set well; but the hot dry weather supervened, and entirely checked the growth of the plant and the swelling of the fruit. The consequence has been, that generally only one good gathering was obtained, except in places very favourably situated for the cultivation of this very desirable fruit.

The Raspberry, among small fruits, is next in demand to the Strawberry, indispensable in many ways in the kitchen; and the order for the usual quantity is always imperative with the housekeeper. The Raspberry is a moisture-loving plant, found wild plentifully in the the northern counties in moist and shady places on the outskirts of woods, associated with Foxgloves and certain varieties of the Dog Rose, which circumstance gives a clue to its cultivation. The best plantation of Raspberries we ever remember to have seen, occupied a low quarter somewhat shaded by large trees at some little distance; the soil moist, and a deep very sandy loam resting on pure sand. The canes were extremely luxuriant, running up straight and strong. Such a situation should always be chosen, if possible, for a plantation. A north border answers very well in the south, but is too shady in the north. The space behind north walls, however, is too limited and valuable for summer crops. Where there is no choice, the best must be made of any open quarter at command; and much can be effected by management.

The first consideration is well trenching the soil to the depth of 2 feet at least, for although the Raspberry is a shallow-rooting plant, yet deep trenching is advisable to aerate the soil and make the surface sweet. If the land is at all heavy, a liberal dressing must be given of any material which will have the effect of lightening it—such as lime rubbish, burnt clay, sand, leaf mould. We have used sifted coal ashes, mixed with manure bountifully, on heavy clay with the best effect; and with annual top-dressings of the same the roots will soon abandon the clay, and spread themselves among the top-dressing like a mat.

Although the Raspberry will make very luxuriant growth under favourable circumstances, we do not think it advisable, as with other fruits, to give it much room; planting in rows 4 feet apart each way will be sufficient. The roots do not wander far from the plant. The plants being close shade the soil and protect the roots from the heat of the sun; and the annual top-dressing will maintain the plants in vigour better than a larger space of ground could be supposed to do. We annually wheel in amongst our Raspberries, and other small bush fruits, unlimited quantities of short grass from the machine-mowings of the lawns; it shades and keeps the soil moist, prevents the growth of weeds—for it must be remembered that this grass contains no seeds of weeds—and finally it is dug into the ground with more manure in winter.

There are various plans adopted for the support of Raspberry canes; but the best we have tried is training them fan-shaped to wires stretched along the rows espalier fashion, strained from posts at either end, the fruiting canes to be trained right and left, leaving the centre over the stools open, so as to give room for the young canes in summer as they grow.

Bending the canes over rainbow fashion, and tying the tops together is often practised, and has the advantage of not requiring any stakes; but the plan gives greater facilities to the birds to rest on them when the fruit is ripe; and bundling the

canes together is always objectionable. Tying the canes to upright stakes in bundles is also objectionable, though the simplest plan, as there is not sufficient room for the development of the young canes and the fruit-bearing shoots together. This bundling system is not favourable to a proper circulation of air among the ripening fruit. The espalier system is much to be preferred, as it allows room for the fruiting branches to extend right and left, they receive an abundant circulation of air, the young canes have room to grow, and finally, the fruit can be gathered with more facility. The best Raspberries with which we are acquainted are the Red and White Antwerp, the Fastolf, and the Sweet White Antwerp.

The autumn Raspberries—October Red and Yellow—unlike the common summer kinds, are of a drooping, more straggling habit, and partake more of the habit of the Blackberry or Bramble. They require a dry warm situation, in order that they may ripen off their fruit at a season when there are much rain and occasional frosts. They are more slender in habit than most of the summer sorts, and like the Bramble fruit on the current year's growth from the stool; they should therefore be entirely cut over early in spring. The Bramble finds support by spreading itself over the hedgerows, or any support which may be near. The autumn Raspberries must also have some support, else the fruit gets chafed and broken by the wind. A good plan is to drive in three strong stakes round each stool, and tie a wire or wooden hoop to them horizontally; spread out the canes of the Raspberry, regulate and tie them to the hoop, letting them hang over to the outside. All weak growths must be pulled up in summer, leaving six or eight of the strongest canes. It must not be expected, however, that these autumn Raspberries are equal in flavour to the summer varieties, nor are they so large as the Red and Yellow Antwerp. They are, however, very prolific, and come in to help the dessert and the cook at a time when small fruits are scarce.

Raspberries will occupy the same situation for many years in succession, and yield good crops where the soil and climate are favourable to them; but in many instances, especially on dry soils, it will be necessary to renew frequently, if strong growth is to be maintained, and consequently crops of fine large fruit. The Raspberry has a tendency also to spread, and the stools get ragged and worn out. To form new plantations, the strongest suckers should be carefully lifted and transplanted into nursery lines for a season, to gain strength and make roots and buds at the bottom; the following season, when ground has been trenched and prepared for them, they may be finally planted as before indicated. Old plantations will be much improved by having the soil dug away from around the stools up to the points of the roots, and also shaking away the soil partly from the roots, and substituting fresh rich soil, spreading the roots well out in it, and afterwards well mulching with rotten dung.

The canes of Raspberries should not be pruned or shortened until the wood is ripened and the foliage fallen; and there should be no deep digging between the rows, so as in any way to injure the roots.—(*The Gardener.*)

FLOWERS FOR OUR BORDERS.—No. 43.

WULFENIA CARINTHICA—CARINTHIAN WULFENIA.

It is not uninteresting to note that the immense variety in form, size, and colour which obtains among the members of the vegetable kingdom extends also to their distribution. Thus we find that while some are almost ubiquitous, and others are spread over wide areas of the earth's surface, many are restricted to a few localities, and occasionally to a single spot. To the latter class belongs the subject of our illustration, it being found only, so far as is yet known, upon one mountain in Carinthia.

Of the numerous alpine plants now at the disposal of the lover of these floral gems there are not many possessing greater claim to attention than this beautiful little plant. To some of our readers the *Wulfenia carinthica* is probably an "old familiar face;" but it is much less extensively grown than might, perhaps, be inferred from the mere date of its introduction. In the front ranks of the mixed border its spikes of bright blue flowers produce a charming effect, especially when grown, as it may be, in a good patch, or if several plants of it are grouped together. It may be termed a spring flower, for it usually commences blossoming in May, and continues in bloom until July.

The *Wulfenia carinthica* is a perennial plant of dwarf habit,

its foliage, which is all radical, not exceeding 6 inches; the flower-scapes, however, often grow to the height of from 12 to 16 inches or more before the blossoms are all expanded. The leaves are obovate, blunt, with doubly crenate margins, and when full grown are spread flat on the ground; the small leaflets attached to the flower-scapes are more acute and sessile, with their margins rolled back.

The spike of flowers is at first drooping, but afterwards becomes nearly erect, though there is generally a slight inclination to one side. The flowers are bright blue, with a yellow throat, on short peduncles, closely arranged, and are somewhat remarkable for their oblique position.

Fig. 117.—*Wulfenia carinthica*.

From the character of its natural habitat it will be readily inferred that the *Wulfenia* is an excellent rock plant, but it will not endure full exposure to sunshine, neither will it flourish if allowed to suffer from drought; a partially-shaded situation should therefore be allotted to it. In the border it will succeed in any light rich soil free from stagnant moisture, which is injurious to it, especially in winter. In severe weather it should be covered with an empty flower pot, and in long-continued rains in winter the same precaution may be adopted with great advantage. In unfavourable localities it may even be advisable to pot it in autumn, and preserve it through the winter in a cold frame or turf pit, though this precaution will hardly be necessary south of the Trent. It may be increased by division in spring and autumn, and also by seeds, which it sometimes ripens; if a few of these are saved annually its protection will then be a matter of less importance, as young plants are readily raised from seed.—(*W. Thompson's English Flower Garden, Revised by the Author.*)

THE HORSE AND SWEET CHESTNUTS.

In an extract from "The Household Guide," in your issue for October 15, page 346, there are remarks on the Horse Chestnut which certainly are at variance with the opinion of most, if not all, who have had anything to do with such trees, more especially the recommendation for the fruit to be given to cows to increase the amount of milk; for most certainly in all places I am acquainted with the injury done to the milk of cows who partake of Horse Chestnuts is of so serious a kind as to unfit the butter for all except the very commonest of purposes. We all know, or rather I ought to say all country people living where Horse Chestnuts abound know full well, the acrid bitter taste of the otherwise tempting fruit, and we also know how quickly milk is acted upon and partakes of the

flavour of the food the cow has to eat. Cabbages and Turnips are very distasteful, and their absence from the food given to cows is often insisted upon by all who are judges of butter, yet they are tasteless compared with Horse Chestnuts; but that cows eat these I have the best of all proof, and having once tasted them they seem to get a hankering after them, and if allowed to partake of them in quantity, I question very much if the milk would bear the test of the analyst. Certainly the merest tyro in acquaintance with milk would condemn it. Having a good many Horse Chestnut trees scattered about our pasture lands, we have been in the habit of having the fruit picked up every day for some years, but latterly have discontinued the practice, the crop not being heavy until this year. When the cows have had access to the fields partly overhung with Horse Chestnut trees they have eaten of the forbidden fruit, and the consequence is the butter, I am told, is only fit to melt-up for kitchen use. So much for that part of the Horse Chestnut fruit; but how far it may be useful to horses troubled with shortness of breath I am unable to say. Perhaps it may be of service then, although the two purposes it is recommended for seem too much opposed to each other. To relieve horses in breathing, and to make a paste for shoemakers and bookbinders, seem contradictory applications. Perhaps the bill-stickers—now-a-days a rather numerous community—may take a hint, and a saving of more palatable food be the result.

Let us now turn to what I expect is meant—the Sweet Chestnut, a tree not quite so widely different from the Horse Chestnut as the chestnut horse, but bearing no resemblance whatever in foliage, character of timber, or botanical structure, being, in fact, about as much unlike as the Globe Artichoke is to the so-called Jerusalem Artichoke. But here the writer of the paragraph is again at fault. I have seen several trees of the Sweet Chestnut cut up, and in the rough condition they certainly resemble the Oak very much, but when dressed the difference is very perceptible; moreover, the difficulty of getting a perfectly sound piece is so great that it will never be a competitor to the Oak for the many purposes the latter is put to. I have seen trees with a trunk from 30 to 40 feet cubic measurement, and when sawn up, no matter whether at the time of cutting down or a year or two afterwards, the planks or quarterings, whichever it was sawn into, would in most instances splinter and almost fall in pieces. Observe I am speaking of perfectly healthy sound trees, no disease nor defect being visible anywhere; yet the adhesion of the timber in a lateral direction is so imperfect that the wood falls to pieces almost in the hands at the time of sawing, or it may be afterwards: so great is this evil that Chestnut timber is but little used for any but rough purposes. We have gate-posts of it that we have found it necessary to bind round the top with iron hoops to prevent their splitting, perhaps, half the way down or more. This is unfortunate, as the tree is certainly one of the handsomest I know, exceeding the Oak in that respect. Summing-up, however, what I know of the timber in a plain practical way, I may say that trees from 6 to 8 and 10 feet of cubic measurement generally cut up better than older ones, the adhesion of the lateral connecting fibres being stronger in a young tree than in an old one. I may further add that the want of adhesion complained of, though greatest in the concentric rings forming the yearly growths, is not confined to these alone. The section of the tree when cut is also liable to star, to use a glazier's phrase, and these star openings extend much further than in any other timber I am acquainted with, so much so that Chestnut timber for anything excepting rough work is seldom met with. Of its utility for cask-making I can give no opinion; excepting that from the faults laid to its charge above I question it much; and I must also leave to others to solve the disputed question whether the roof of Westminster Hall is composed of this timber or not.—A CORRESPONDENT.

HARDINESS OF VARIETIES—FRUIT-GROWING IN THE OTTAWA VALLEY.

THE recent meeting of the Fruit-Growers' Association of Ontario, held in the city of Ottawa, has called attention to the fruits of that region, and has added not a little to our knowledge of what may be done there in the way of fruit-raising.

The valley of the Ottawa enjoys a high reputation for productions of various kinds. Her lumber production is enormous,

her quarries of stone inexhaustible, her marble abundant and susceptible of a high finish, her agricultural productions of a most valuable description. But we have been in the habit of thinking of that region as one possessing a climate far too inhospitable to admit of the growing of fruits. Nor has this impression been altogether without foundation. The severity of her long winters, with upwards of 60° of frost, must of necessity preclude the raising of many very fine sorts of Apple, Pear, Plum, and Cherry, thus almost always necessitating in the planter a degree of knowledge of the relative hardihood of different sorts which he could not be expected to possess.

Many were the attempts made to grow the finer varieties of our various fruits, and nearly as many were the failures, not because of a want of knowledge on the subject of fruit culture in general, but because of a failure to perceive what modifications the peculiarly severe climate and the nature of the soil demanded. Trees were introduced which were wholly unable to bear the severity of that climate, and planted in soil not prepared to receive them. To these two causes—the planting of varieties too tender to endure the climate, and the want of proper drainage of the soil, may be attributed the many and repeated failures which have resulted so disastrously to the planters themselves, and thrown for a time such a cloud over the whole subject of fruit-production throughout that region. Happily for all interested, that cloud is being lifted. With the increase of wealth among the population there has come an increased attention to the question whether good fruit could not grow in their own grounds. Relieved from the pressure of that necessity which compelled the earlier settlers to toil that they might eat, and to eat that they might toil, then came the leisure to study out the difference of constitution in different sorts of the same fruit, and to experiment with these different sorts until those were ascertained which could bear the severity of the climate; while at the same time the means wherewith to underdrain and thoroughly prepare the soil for the growing of fruit trees were at command.

Hence it is that now we have some well established data to go upon in the planting of fruit trees in the Ottawa valley, some points ascertained by actual experiment which serve as guides and finger-posts for all who may hereafter desire to grow fruit there. From the very interesting discussions and relations of experience in these matters which were elicited by the recent meeting of the Provincial Association, we can now say to every landowner in the valley, that he may grow good fruit of many kinds if he will carefully inform himself upon three points:—

- 1st, The varieties that are sufficiently hardy.
- 2nd, The drainage of the ground upon which he intends to plant; and
- 3rd, The form in which he trains his trees.

Experiment has demonstrated that the varieties of the Apple which can be grown successfully are the Duchess of Oldenburgh, Red Astrachan, Snow Apple, Hawthornden, St. Lawrence, and Golden Russet, and all the different Crab Apples. To this list of varieties might be added, with every prospect of success, a few more which have proved to be very hardy in other places where the winters are fully as severe as they are at Ottawa. Of these we venture to name the Telafski, Pewaukee, Wallbridge, Wealthy, Ackerman, Allen's Russet, and Clark's Orange. They have stood unhurt through winters in which the thermometer frequently ranged from 30° to 40° below zero, and therefore are worthy of a trial wherever hardihood is an essential requisite.

It seemed to be a very difficult matter to find a Pear tree that would endure the climate. Even the Flemish Beauty had been killed to the snow line; yet we are disposed to believe that with proper drainage and training both the Flemish Beauty and Clapp's Favourite could be grown and fruited there.

Some of the finer sorts of Plums have been grown with a measure of success. Gentlemen spoke of the Bradshaw, Coe's Golden Drop, Lombard, &c.; but the impression remains that Plums do not succeed as well here as they do at Owen Sound; whether it be because of the cold or for want of proper drainage it is not yet possible to decide.

The only Cherry that has been successfully grown here is the one known generally as the Kentish or Red Pie Cherry. Probably a few of the different sorts of the hardy Morello Cherries would succeed; but none of those likely to endure the climate are of any better quality than the Kentish.

Quite a number of varieties of the early-ripening Grapes will thrive well here, but they must all be laid down and protected

during the winter. The Bamelan, Hartford Prolific, Israella, Delaware, and others ripening not later than these, could be grown with great satisfaction.

Small fruits of every description and every sort, whether Currants, Raspberries, Gooseberries, Blackberries, or Strawberries, can be grown here in the highest perfection, and with the greatest ease. The snow affords them a perfect protection from the cold, so that sorts which are tender at St. Catherine's never suffer from the winters at Ottawa. There is no reason why a plantation of small fruits for the Ottawa market should not be a success.

One of the difficulties in the way of the successful growing of the Apple and other large fruit trees seems to be found in the amount of water present in the subsoil. During the winter the ground is not frozen, and the snow is gradually but continually melting and filling the ground with water. And in the spring this process goes on in increased proportions, so that when the sun has become warm, and by its heat is causing the sap to flow in the branches, and the buds to expand, the roots are kept inactive by the cold wet soil. Under such circumstances it is impossible for the trees to thrive; they may endure for a few years until the roots get into this cold wet subsoil, and then they will begin to show signs of decay, and rapidly die out. The only remedy for this evil is thorough under-draining. Where sufficient fall can be had, the drains should be about 4 feet deep, and not more than 40 feet apart, and of sufficient size to discharge the surplus water rapidly. Would our Ottawa fruit-growers thus prepare their ground before planting their fruit trees, we feel sure they would find their trees would be much longer-lived, and that some varieties could be successfully grown that have hitherto failed.

From what we saw in the grounds of the Hon. R. W. Scott, and gathered from conversation with other gentlemen, there can be no doubt that low heads are the proper form in which to train fruit trees in the Ottawa valley. A long upright trunk is too bare and exposed for the extremes of that climate, and growers have learned by the test of experiment that those trees are the most healthy which are trained low.

The members of the Association living in milder latitudes have returned from the meeting favourably impressed with the capacity of that section for the production of many varieties of fine fruit. All that is required to enable gentlemen to grow all their own summer and early autumn fruits is a judicious selection of sorts, combined with well-drained soil and properly trained trees.—(*The Canada Farmer*.)

STRAWBERRY CULTURE.

I WOULD advise "AMATEUR" and others that have any difficulty in fruiting Strawberries the first year, any sort, to plant from the 1st of March to the 1st of April, according to circumstances. The ground to be well trenched and manured at the proper time. Place the Strawberry plants 30 inches between the lines, and 21 inches apart in the rows. Plant a line of some sort of early Potatoes (I plant Myatt's Ashleaf) between the lines of Strawberries. Spring the Potatoes before planting 1 inch, lift them as fast as possible, and by this time of the year the Strawberries will require all the room I have mentioned. I pick off all Strawberry blooms the first year; that is no loss. I generally sow Lettuces after the Potatoes are lifted.—JAMES WRIGHT, *The Gardens, Gloster Lodge, Croydon*.

CARTER & Co's FIFTY-GUINEA CUP is to be absolutely won this coming season. It is the largest prize for vegetables for the year.

NOTES ON VILLA AND SUBURBAN GARDENING.

ONCE more the products of the kitchen garden claim attention. The weather has hitherto been so very mild that much of the work could with advantage be delayed; but now that we have had a few degrees of frost, with signs of more, our necessary work must be at once done. Cauliflowers, where they are just turning in and not injured by a too low temperature, should be taken up carefully with balls of earth, and placed thickly together under some protection from frost; they will thus keep good for at least another month. The same process must be carried on for the autumn and winter Broccoli, such as Grange's, the Purple Cape, and Snow's Winter White, as they come in for use; these are much harder than the Cauliflower, and may be expected to yield gatherings throughout the autumn, and Snow's Winter White from Christmas onwards.

Now a word or two as to laying down the heads of Broccoli. I, for one, do not think it is necessary to adopt the plan generally. In gardens where the situation is low and damp, and where, perhaps, it is also not in one of the best positions to receive its share of sun, it is probably an advantage to bury the stems in earth, as the frost would most likely affect them much; but in a properly-drained garden, which from its position is airy and dry, it is seldom necessary to lay down Broccoli, unless from circumstances the plants have grown very tall; then it is, perhaps, a wise plan to protect the stems. There is one plan I do agree with, and that is when the plants are growing too luxuriantly through the influence of a mild autumn to check their growth by turning them on one side, they are then in a better condition to withstand frost. It is not a good plan to encourage luxuriant growth too late in the autumn, and it is generally the dwarf-growing sorts that stand the winter best.

Globe Artichokes must now be attended to, for they suffer as much from damp as from frost. If they are growing in rows, dig-out a trench between them, and cast the earth up about their roots in such a form as to throw-off the wet; they may likewise be protected with a little light litter during severe frost, but it must not be allowed to stay on a day after the frost is gone. It is time now to cut picking Cabbage when they have had a little frost on them, as those left after this are liable at any time to split up and become worthless. Plant-out more to come in next season, or it may be deferred till spring, but then the produce is not likely to be so large nor the Cabbage of so good a colour, owing to the want of a little more time to grow.

Continue to place under cover all sorts of Lettuces and Endive as they turn-in fit for use. We have at this time abundance of the Siberian Cos, and Lane's Black-seeded Bath Cos turned-in with nice hearts; they are on a south border, and protected at night by garden mats. The Tom Thumb Cabbage Lettuce is planted thickly in old wooden frames and pits in order to come in for use more towards Christmas; while the same sort in very small plants is put out thickly under walls and in frames for spring planting. Mustard and Cress must now be raised indoors. Any sort of vessel will do for this. I raise mine in shallow boxes, in size 2 feet by 1. The Mustard is covered with a little earth, but not so the Cress seed. It is simply watered, and another box turned over it till the seed vegetates; after that it will do all right, but it is not always that the seed comes up well unless this is done. Stir the soil among Onions, Spinach, and young Cabbages, or any other young growing crop in fine weather; if it do no other good a number of slugs will be killed by the operation.

Now let us look at the fruit garden, and I must say that near this large town the outdoor Vines have in many cases produced excellent crops. The principal sorts are the Black Cluster, Sweetwater, and some Black Hamburgs, and through the fine autumn I consider they are of better flavour than usual. When they are not cut the bunches must be protected from frost, and no bad berries should be allowed; if so, the whole bunch soon decays. I am sorry to see so many Vines neglected, which, from their healthy appearance, might be induced by cultivation to produce a fair crop of fruit. In favourable seasons like the present, by proper attention to regulating the growth, thinning the bunches and berries, good results might be expected.

Those who grow Strawberries in pots ought now to lay them up for the winter. Of course I assume that those small growers have not any convenience for storing them under cover, therefore they must be laid-up outdoors. I find it a good plan to place the pots on a bed of ashes, pushing between each pot some leaves, rough manure, &c., tightly, and not lay the pots on their sides; and if the spot is somewhat elevated, so that no water can lodge about them, they will be secure from injury at the root by frost; but when that comes at all severe, it is as well to protect the foliage by throwing a little rough straw over the whole. It is time that fresh plantations of Raspberries were made where such are wanted, and the others filled up where vacancies occur. Prune them to the height of the stakes, and leave no more than five nor less than three canes to each plant; top-dress them with manure, but do not dig among them, or it destroys an abundance of roots, which in this plant are only just under the surface.

Flower-garden plants in frames must have an abundance of air at all favourable times, so as not to let them grow too fast now the shorter days are here. Keep the flower beds picked of decayed blooms, and clear from dead leaves; water them sparingly, and if any plants are making a coarse growth beyond the others, pinch-out the point of the shoot. Plant Roses now, and cover the roots with a coating of protecting material. Camellias will now be advancing towards blooming. Thin-out the buds to not more than three to a shoot: sometimes two, or even one will be enough to leave; the strength and health of the plant will be a guide. Azaleas may now be kept cool preparatory to putting them into the greenhouse for blooming. Now is the

time to pot-up Lily of the Valley for forcing if the roots are taken up from the bed. Select the largest and thickest crowns with as much of their own root as possible, place them thickly together in pots, and work some soil among them; water well, and set them aside in a cool frame for a time, and they will be ready to bear forcing.—T. RECORD.

BLACK PEPPER.

VERY early in the sixteenth century, in consequence of the discovery of the passage to India round the Cape of Good Hope, Pepper became a condiment commonly used in Europe; and Lyte, writing in 1578, tells, "It is put into sauces to give a good smack and taste unto meates, to provoke appetite, and helpe digestion;" and the use of it so rapidly increased that about thirty years ago the quantity collected amounted in the East Indies to 50,000,000 lbs., of which one-third came to Europe, and the chief part of the remainder went to China. Since then the growth in India has vastly increased, and so has the importation into England. In 1873 no less than 26,324,828 lbs. were brought hither, valued at £818,437; but 12,386,469 lbs. were again exported. Yet in the fifteenth century the use of this spice was not uncommon, for in a MS. possessed by the Royal Society of that date are many recipes in cookery; and in one entitled "Brus to Potage," being a meat stew, it is directed to season it with 'pouder of pepur and of clowes,' and the 'pouder of pepur' is an ingredient in many other of the recipes, one of which being very brief we publish unabbreviated.

"PEJONS SIWET.
—Take pejons and wassh hom clene, and stoppe hom well with garlek, and parsel small hewen, and do hom in a potte by homself; and therto gode brothe and sauge, and parsel, ysoppe and savoray small hewen, and pouder of pepur and of clowes, and colour hit with saffron, and do therto verjns, and serve hit forthle."

What we have written refers chiefly to the use of Pepper in the British islands, but it was known to the ancients. Hippocrates only mentions it as used in medicine, but Pliny speaks of it as a condiment, and was surprised at its use because it has no agreeable flavour. Even as late as the thirteenth century it was costly, and a few pounds were considered worthy of acceptance by a monarch.

"What is Black Pepper?" is asked in a periodical now before us; and although we do not usually reply to extraneous questions, we make an exception to our rule, and reply, It is the fruit of a climbing plant, *Piper nigrum*; and we will add that White Pepper is produced from the same plant. An old authority truly states:—"White Pepper is the ripe and perfect berries of the same species stripped of their outer coats. For

this purpose the berries are steeped for about a fortnight in water, till, by swelling, their outer coverings burst; after which they are easily separated, and the Pepper is carefully dried by exposure to the sun; or the berries are freed from their outer coats by means of a preparation of lime and mustard oil, called 'Chinam,' applied before it is dried. Pepper which has fallen to the ground over-ripe loses its outer coat, and is sold as an inferior sort of White Pepper."

Another authority upon which we cannot improve, relates that in the East Indies it is very extensively cultivated, the plantations stretching from the 96th to the 115th degree of east longitude, and from the 5th degree of south latitude to the 12th of north latitude, which limits comprise Sumatra,

Borneo, the Malay Peninsula, and all countries to the east of the Gulf of Siam. The best Pepper comes from Malabar, the least esteemed from Java and Sumatra. The plant is allowed to grow trained to the stem of the Areca Catechu and other trees, especially the Jack (*Artocarpus*) and *Hyperanthera Moringa* (or Horse-radish Tree), four years before the fruit can be collected. The berries are gathered when yet green, before they are perfectly ripe, and quickly dried on mats, by which they turn black. When plucked too young they speedily fall into a state of powder. These are separated from the others by sieves and winnowing. In this condition it is termed Black Pepper. White Pepper is the same fruit freed from the outer rind: for this purpose the ripe berries are allowed to macerate in water and the husk is removed. These are smaller, smooth, of a greyish white colour varying to yellow, with a less powerful odour and taste than the Black.

Fig. 118.—BLACK PEPPER (*PIPER NIGRUM*).

The plant is stated in the "Hortus Kewensis" to have been first introduced into our stoves by Messrs. Lee & Kennedy in 1790.

LARGE PEARS.—Mr. G. Thomas, fruiterer, St. Helier, Jersey, last week exhibited three Pears of the Belle de Jersey [Uvedale's St. Germain], which weighed respectively 3 lbs. 4 ozs., 3 lbs. 5 ozs., and 3 lbs. 14 ozs., making a total of 10 lbs. 7 ozs. The Jersey pound being 17½ ozs. avoirdupois, this gives the extraordinary weight of 11 lbs. 6 ozs. English for these three Pears.

DOINGS OF THE LAST AND PRESENT WEEKS.

HARDY FRUIT GARDEN.

THE culture of hardy fruit trees is carried out to a much larger extent and more generally understood than heretofore. In a previous number allusion was made to the dwarfing stocks for various trees, and amateurs are indebted to these for the very neatly-trained pyramid and bush trees that are to be found in

many villa gardens. Mr. Thomas Rivers, the veteran cultivator of the Sawbridgeworth Nurseries, has done good service by publishing his "Miniature Fruit Garden," where the pinching and summer-pruning of the trees are fully explained; but one mistake is very easily and also very frequently made, and that is to allow the branches to become too much crowded. When this is the case the wood does not become thoroughly matured, and the proportion of fruit buds will be few in comparison to those trees where the young growths have been sufficiently thinned-out. We have a good deal of extra work, and cannot as yet get at the trees, otherwise we would have gone over them all about this time, and thinned-out not only the young wood, but also the larger branches and all unsightly apura. Free-bearing trees and those that are well furnished with blossom-buds have a dressing of rotted manure placed over the roots at this time of the year; the nutriment from this is washed down to them. It also acts as a stimulant to them as well as a mulch in summer. It is better not to mulch any trees that have made much unfruitful wood; the extra stimulant will cause the trees to grow more freely than is desirable to produce fruitful wood.

There is also much difference of opinion as to the desirability of digging the borders or not. Some persons contend that a spade or fork should never touch the soil, others that the borders should be dug annually. Now both parties may be right, and the only difference is in the character of the soil. In light sandy soils it is better not to break up the surface, but on stiff, clays this may be done with advantage. If it is not done it is hardly possible to get a Dutch hoe to penetrate the surface, and the ground cracks in all directions. There are two advantages from digging the surface of the ground amongst fruit trees; one is that the garden looks neater in winter, and in spring the ground can be easier hoed.

Running the hoe through the *Strawberry beds*, and cutting-off the runners and decaying leaves. This is also the time to dig between the rows where the same beds are allowed to remain many years in succession on the same ground. Sometimes all trace of the rows is lost in the interminable maa of runners; when this is the case a line is stretched from one end of the bed to the other, and rows are cut out of the maa with a sharp spade or a grass edging iron. In good Strawberry soils a fair crop of inferior fruit may be obtained from plants treated in this way, but nothing as compared to that from the annual or biennial renewals of the plants. When the plants are established for many years on the same ground, attention should be given to keep them clear of runners during the growing season, to allow only the crowns that are intended to bear fruit to ripen perfectly.

FRUIT HOUSES.

Pine Houses.—The weather has been very favourable to the ripening of fruit—a high temperature out of doors with a moderate amount of sunshine. The same favourable weather has also been suitable to the ripening of early suckers, which will throw up fruit in March. The treatment of the latter as to atmospheric conditions and temperature is very different from that accorded to fruiting plants. For the first secure a warm dry atmosphere, about 65° at night, with a free circulation of air as often as the state of the weather out of doors will admit of it; for the other the atmosphere should contain a moderate degree of moisture—not a steaming atmosphere, but such as would be obtained by damping the walls and paths of the house twice daily, not from allowing water to come in contact with the hot-water pipes to cause a steam. What are wanted are not very large plants with long dark green leaves, but stout stocky plants with the pots well filled with roots, and which have not been over-stimulated by rich soils or liquid manures. When Pine plants are grown to a very large size, even if they have all the appearance of robust health, it is seldom that fruit is produced in proportion to this gigantic growth. A warm steaming atmosphere with little air will produce a healthy-looking but not a really healthy growth. The last plants in the fruiting house have been taken out of the bed and placed in a lateinery, as all the fruit were changing. A batch of plants fruiting, and which will yet throw up, has been removed to the house. The old plunging material has been removed and a fresh lot put in place of it; the reason being, that the old though not quite exhausted tan becomes full of woodlice and crickets. Clearing the whole out frees the house of these and other pests.
